Continuation-in-part of Ser. No. 786,895, Oct. 11, 1985, Pat. No. 4,861,785, which is a continuation-in-part of Ser. No. 677,412, Dec. 3, 1984, abandoned. This application Aug. 24, 1989, Ser. No. 398,212

Int. Cl.[4] **C07D** *471/04*, *277/60*, *263/58*

U.S. Cl. 546—114 **23 Claims**

1. A compound of the formula

(III)

a pharmaceutically acceptable acid addition salt, or a possible stereochemically isomeric form thereof, wherein

A^1 A^2 A^3 A^4

is a bivalent group of the formula

—CH=CH—CH=CH— (a),

—N=CH—CH=CH— (b),

—CH=N—CH=CH— (c),

—CH=CH—N=CH— (d), or

—CH=CH—CH=N— (e),

wherein one or two hydrogen atoms in the group

$-A^1=A^2-A^3=A^4-$

may, each independently from each other, be replaced by halo, C_{1-6}alkyl, hydroxy, C_{1-6}alkyloxy, or trifluoromethyl;

Z is O or S;

n is 0 or the integer 1;

R is a member selected from the group consisting of hydrogen, C_{1-6}alkyl, hydroxy, or C_{1-6}alkyloxy;

R^1 and R^2 are hydrogen, C_{1-6}alkyl, or Ar-C_{1-6}alkyl, provided that when the dotted line between the nitrogen atom bearing R^1, the intermediate carbon atom, and the nitrogen atom bearing R^2 indicates that a double bond exists between the nitrogen bearing R^1 and said intermediate carbon atom, then R^1 is absent, or when the double bond exists between the said intermediate carbon atom and the nitrogen bearing R^2, then R^2 is absent; wherein said intermediate carbon atom is the carbon atom positioned between the nitrogen bearing R^1 and the nitrogen bearing R^2,

wherein Ar is phenyl optionally substituted with up to three substituents, each such substituent being independently selected from the group consisting of C_{1-6}alkyl, C_{1-6}alkyloxy, halo, trifluoromethyl, cyano, C_{1-6}alkylcarbonyl, nitro, amino, and aminocarbonyl; and

R^3 or R^4 are both hydrogens or R^3 and R^4 combined may form a bivalent group of the formula $—CH_2—CH_2—$.

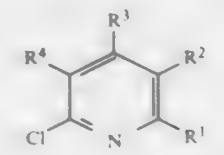
PROCESS FOR THE PREPARATION OF SUBSTITUTED 2-CHLOROPYRIDINES

Dieter Kaufmann, Bergisch Gladbach, and Bernd Gallenkamp, Wuppertal, both of Fed. Rep. of Germany, assignors to Bayer Aktiengesellschaft, Leverkusen, Fed. Rep. of Germany

Filed Nov. 1, 1989, Ser. No. 430,389



Claims priority, application Fed. Rep. of Germany, Nov. 22, 1988, 3839332

Int. Cl.[5] **C07D** *213/61*

U.S. Cl. 546—316 **9 Claims**

1. Process for the preparation of substituted 2-chloropyridine derivatives of the formula (I)

(I)

in which

R^1 represents hydrogen, chlorine, cyano, carbalkoxy(C_1-C_4) or

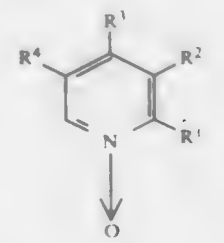
where R^5 and R^6 are identical or different and represent hydrogen or alkyl (C_1-C_4),

R^2 represents hydrogen, chlorine, alkyl(C_1-C_4), halogenoalkyl(C_1-C_4), cyanoalkyl(C_1-C_4), alkoxy(C_1-C_4)-alkyl(C_1-C_4), dialkylamino(C_1-C_4)alkyl(C_1-C_4), carbalkoxy(C_1-C_4) or

where R^5 and R^6 are identical or different and represent hydrogen or alkyl (C_1-C_4)

or where R^1 and R^2 together represent the bivalent group —CH=CH—CH=CH—,

R^3 represents hydrogen, chlorine, carbalkoxy(C_1-C_4) or



where R^5 and R^6 are identical or different and represent hydrogen or alkyl (C_1-C_4), and

R^4 represents hydrogen, chlorine or cyano,

or where R^3 and R^4 together represent the bivalent group —CH=CH—CH=CH—,

wherein pyridine 1-oxides of the formula (II)

(II)

in which

R^1, R^2, R^3 and R^4 have the abovementioned meaning are reacted with a chlorine-containing phosphonic acid deriv-

ative from the series of the chlorophosphoric esters and chlorophosphoramides in the presence of an inert organic solvent and in the presence of an acid acceptor at temperatures between −20° C. and 200° C., and the resulting product is separated further, if appropriate.

RESIN COATED ELECTRIC CIRCUIT BOARD DEVICE

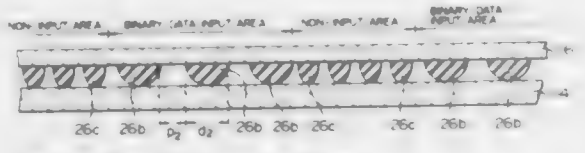
Chiaki Sumi, and Wataru Kuwayama, both of Aichi, Japan, assignors to Aisin Seiki K.K., Aichi, Japan

Filed May 30, 1989, Ser. No. 357,929
Claims priority, application Japan, May 31, 1988, 63-134917
Int. Cl.[5] H05K 1/18
U.S. Cl. 174—52.2 2 Claims

1 A resin coated electric circuit board device comprising

a base plate having at least one through hole extending therethrough;

at least one electrical device mounted on and electrically connected to said base plate in overlying spaced relation to said through hole; and



resin coating means covering said base plate and each electrical device including said through hole and space between said electrical device and said base plate

5,010,213

SIGNAL INPUT SHEET

Masafumi Moriwaki, Yamanashi; Shigeaki Sano, Fuchu; Katsunori Hatakeyama, Koganei; Hiroshi Yamada, Koganei, and Youzou Nouno, Koganei, all of Japan, assignors to Toppan Moore Company, Ltd., Tokyo, Japan

Filed Dec. 27, 1989, Ser. No. 457,401
Claims priority, application Japan, Dec. 29, 1988, 63-335494
Int. Cl.[5] G08C 21/00
U.S. Cl. 178—18 5 Claims

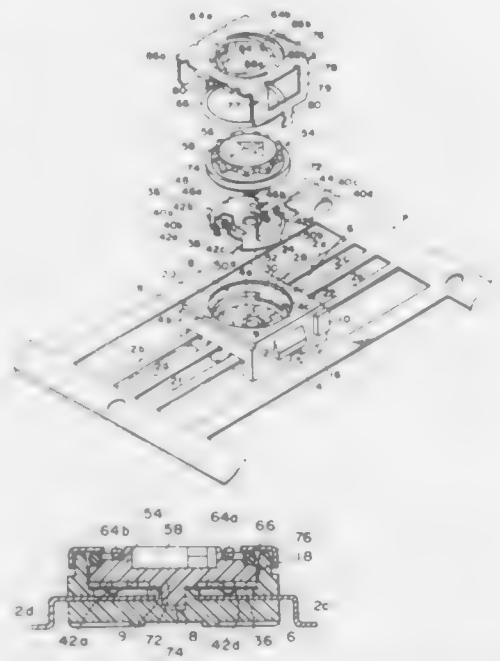
1 A signal input sheet comprising:

a flexible upper laminate having a lower surface and an upper surface, said upper laminate having one of a conductive layer and a resistive layer on its lower surface as a first layer, said upper surface of the upper laminate being divided into at least one hand-written input area for the input of characters and lines and at least one binary data input area for the input of single depressions;

a lower laminate having a lower surface and an upper surface, said lower laminate having one of a conductive layer and a resistive layer on its upper surface as a second layer, where said first layer faces said second layer and at least one of said first layer and said second layer being formed as a resistance layer;

a plurality of insulative spacers interposed between said first layer and said second layer, said insulative spacers arranged at intervals such as to allow an electrical connection between said first layer and said second layer, where a depressing pressure on the upper surface of said upper laminate causes the electrical connection between said first layer and said second layer, said insulative spacers having a larger width in said binary data input area and having a larger spacing between adjacent insulative spacers in said binary data input area;

a voltage source coupled between said first layer and said second layer; and



means for detecting a position at which said depressing pressure is applied on the upper surface of said upper laminate

ROTARY SWITCH

Atsuo Yamazaki, c/o Iruma Center, Copal Electronics Co., Ltd. No. 110-1, Shimoshinden, Araku, Iruma City, Saitama Prefecture, Japan

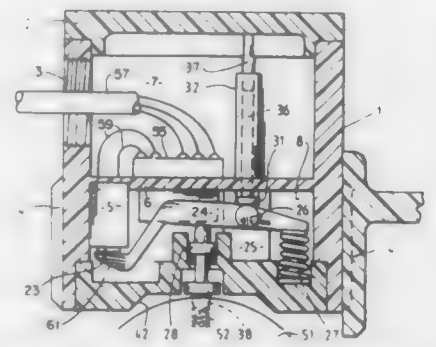
Filed Jul. 7, 1989, Ser. No. 376,599
Claims priority, application Japan, Aug. 11, 1988, 63-106294[U]; Aug. 11, 1988, 63-200966; Aug. 23, 1988, 63-110242[U]
Int. Cl.[5] H01H 19/60
U.S. Cl. 200—6 B 2 Claims

1. A rotary switch, comprising:

a housing having an upwardly open chamber therein and said chamber having a ledge therearound intermediate the depth dimension of said chamber and at least one recess means in said ledge extending in the depth direction of said chamber;

terminal lead fixed contacts in said housing exposed in the bottom of said chamber and spaced from each other;

a planar plate-shaped contact member having a plurality of circumferentially extending output contact fingers and a common contact finger thereon and spaced from each other for permitting individual movement thereof transversely of the plane of said contact member and each output contact finger having a contact projection thereon projecting transversely of the plane of said contact member and a contact point at the end thereof, said common contact finger having a contact projection projecting in the opposite direction from the contact projections of said output contact fingers, and said contact member further having at least one projecting member projecting from the peripheral edge of said contact member, said contact member being in said chamber with said projecting member engaged in said recess means in said ledge and said contact fingers opposed to corresponding terminal lead fixed contacts in the bottom of said chamber with the contact points normally spaced from said terminal lead fixed contacts and with said contact projection on said common contact finger in contact with one of said terminal lead fixed contacts; and



a rotor rotatably mounted in said chamber and having a circuit board on the under side thereof toward said contact member, said circuit board having cam patterns thereon for engagement with the contact projections on corresponding ones of said contact fingers for causing said contact points on said contact fingers to contact said terminal lead fixed contacts in the bottom of said chamber seriatim as said rotor is rotated, whereby said contact member is held in position in said housing between said rotor and the bottom of said housing and is held against movement within said chamber by the engagement of said projecting member with said recess means.

ELECTRICAL SWITCHING MECHANISM

Jonathon E. Farrell, and Mark C. Anthony, both of 8 Chomley Street, Cranbourne, Victoria, Australia 3977

PCT No. PCT/AU88/00405, § 371 Date Aug. 1, 1989, § 102(e) Date Aug. 1, 1989, PCT Pub. No. WO89/03582, PCT Pub. Date Apr. 20, 1989
PCT Filed Oct. 14, 1988, Ser. No. 373,293
Claims priority, application Australia, Oct. 16, 1987, PI4965
Int. Cl.[5] H01H 9/22
U.S. Cl. 200—50 A 7 Claims

1. An electrical switching mechanism comprising:

a housing;

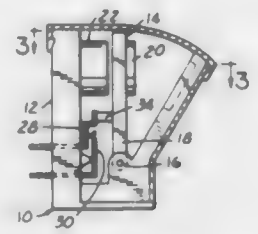
an electrical switch mounted in said housing and actuatable from a first circuit state to a second circuit state;

an operator member extending through a wall of said housing for movement inwardly and outwardly with respect to said housing;

a switch actuator mounted within said housing for movement with respect to said housing, said switch actuator being engageable by said operator member for moving said switch actuator, said switch actuator engaging said switch for actuating same;

biasing means coupled to said switch actuator for biasing said switch actuator toward a first position in which said switch is actuated to the first circuit state and said operator member is moved outwardly of said housing by contact with said switch actuator, said operator member being capable of being urged inwardly of said housing by a force external of said housing to move said switch actuator against the bias of said biasing means to a second position for actuating said switch to the second circuit state;

removable access cover means on said housing for providing access within said housing; and



means within said housing engaging said access cover means and said switch actuator which, upon removal of said cover means, allows said biasing means to move said switch actuator into a condition in which said operator member is unable to operate said switch actuator to the second position.

VELOCITY CHANGE SENSORS

Michael R. Sewell, and Allan W. DeJong, both of Chatham, Canada, assignors to Siemens-Bendix Automotive Electronics Limited, Chatham, Canada

Filed Dec. 21, 1989, Ser. No. 454,674
Int. Cl.[5] H01H 35/14
U.S. Cl. 200—61.45 M 33 Claims

1. A velocity change sensor comprising a body, a mass mounted on said body for swinging motion about an axis that lies transverse to the direction in which velocity change is sensed by the sensor, means on said body and said mass, including a permanent magnet, forming a magnetic circuit for biasing said mass about said axis to an initial position from which said mass swings in response to certain velocity changes applied to the sensor, electrical switch means comprising a pair of electrical contacts mounted on said body at least one of which said pair is resiliently held in non-conducting relationship with the other of said pair coincident with occupancy of said initial position by said mass and which assumes a conducting relationship with said other of said pair only after said mass has swung a predetermined arcuate distance from said initial position.

25. A velocity change sensor comprising a body, a mass mounted on said body for swinging motion about an axis that lies transverse to the direction in which velocity change is sensed by the sensor, means on said body and said mass, including a permanent magnet, forming a magnetic circuit for biasing said mass about said axis to an initial position from which said mass swings in response to certain velocity changes applied to the sensor, reed switch means mounted on said body and is operated in response to a predetermined arcuate displacement of said mass from said initial position, said mass comprising a shutter that is interactive with said magnet and said reed switch means for causing operation of said reed switch means.

5,010,217

INERTIA SWITCH MOUNTING HOUSING

Peter Huenliken, Chatham; John A. Gurd, Wallaceburg, and Douglas Woodman, Chatham, all of Canada, assignors to Siemens Automotive Limited, Chatham, Canada

Filed Feb. 26, 1990, Ser. No. 485,342
Int. Cl.[5] H01H 35/14
U.S. Cl. 200—61.45 R 7 Claims

1. In an inertia switch assembly of the type in which an inertia switch assembly element is disposed within a mounting housing and at least partially encapsulated therein by potting material, said inertia switch assembly element comprising an enclosure containing both an inertial mass that moves within

said enclosure in response to the inertia switch assembly being subjected to certain velocity change and electrical contacts that are operated by said inertial mass to give a switch signal in response to motion of said inertial mass within said enclosure caused by said certain velocity change, the improvement which comprises said enclosure having an open end that is closed by a closure assembly which includes both a closure and an electrical conductor means via which said electrical contacts are placed in conducting relationship with an electrical terminal means which is accessible from the exterior of said mounting housing, sealing means that is axially captured between said open end of said enclosure and said closure assembly to prevent the intrusion of potting material into said enclosure, said electrical terminal means is integrally formed with said electrical conductor means so as to be disposed by said electrical conductor means in axially overlapping and radially outwardly spaced relationship to said enclosure, said mounting housing comprises a radially disposed wall portion which comprises aperture means through which said electrical conductor means passes to said electrical terminal means, and closure means on said electrical conductor means closing said aperture means.

5. In an inertia switch assembly of the type comprising an inertia switch assembly element disposed within a mounting housing, said inertia switch assembly element comprising an enclosure containing both an inertial mass that moves within said enclosure in response to the inertia switch assembly being subjected to certain velocity change and electrical contacts that are operated by said inertial mass to give a switch signal in response to motion of said inertial mass within said enclosure caused by said certain velocity change, said inertia switch assembly element being of the type comprising a magnetic circuit, including a magnet, that magnetically restrains said inertial mass, the improvement wherein said enclosure is non-magnetic, a magnetically conductive element that forms a part of said magnetic circuit at least partially envelopes said body, said magnetically conductive element comprises an axially slotted tube having an end wall, and said magnet is axially disposed between said end wall and said body

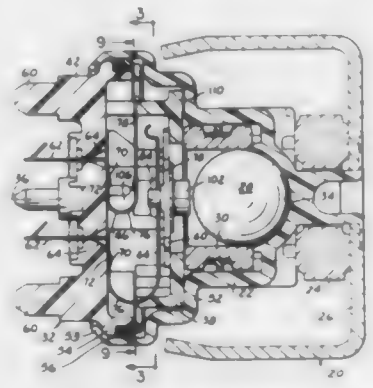
Int. Cl.[5] H01H *35/18*
U.S. Cl. 200—84 R **8 Claims**



1. A float controlled switch, comprising:
(a) a switch portion;
(b) a float portion being displaced a distance from said switch potion;
(c) a tank, said float portion being disposed in said tank filled with a liquid while said switch portion is disposed outside of said tank so that said switch portion is protected from said liquid;
(d) said float portion includes a hollow circular cylinder with a closed bottom, said hollow circular cylinder containing a hole approximately near said closed bottom of said hollow circular cylinder; and
(e) said switch portion includes a substantially square self contained support, said self contained support being made of plastic and having an end that is tampered into the ground outside the tank so that no holes or clamps are necessary to secure said switching portion to said tank.

PUSH BUTTON SWITCH WITH ACTUATOR FOR APPLYING TRANSVERSE FORCE TO BUCKLING SPRING

Takafumi Kato, Iwaki, Japan, assignor to Alps Electric Co., Ltd., Tokyo, Japan

Filed Jul. 7, 1989, Ser. No. 376,712
Claims priority, application Japan, Jul. 11, 1988, 63-90944[U]
Int. Cl.[5] H01H *13/30*
U.S. Cl. 200—408 **5 Claims**

1. A push button switch comprising:
a casing,
a key top slidably insertable into said casing,
a contact portion arranged below said key top,
an actuator rotatably supported on said casing to open and close said contact portion by pressing said contact portion,
a spring retained with curving in a first orientation between said actuator and said key top,
characterized in that a click portion is provided on said actuator by which a transverse force is applied to an outside portion of said spring at or near a midpoint of said spring when said click portion of said actuator is actuated by downward movement of said key top so as to invert the first curved orientation of said spring.

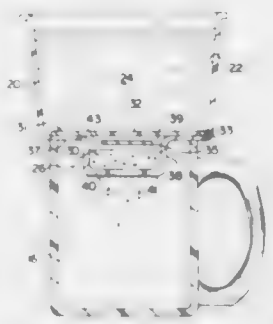
PROCESS AND APPARATUS FOR HEATING BODIES AT HIGH TEMPERATURE AND PRESSURE UTILIZING MICROWAVE ENERGY

Prasad S. Apté, Kingston, and Aniket Pant, Inverary, both of Canada, assignors to Alcan International Limited, Montreal, Canada

Continuation of Ser. No. 308,834, Feb. 9, 1989, abandoned. This application Aug. 30, 1990, Ser. No. 576,164
Claims priority, application Canada, Feb. 16, 1988, 558986
Int. Cl.[5] H05B *6/80*
U.S. Cl. 219—10.55 M **26 Claims**

1. A process of sintering and isostatically compressing a body comprising particles of a sinterable material, which process comprises:
locating said body in a vessel acting as a resonant cavity for microwave radiation of a predetermined frequency, said vessel being able to withstand an internal pressure of at least 20,000 psi at a temperature effective for sintering said particles of sinterable material;
irradiating said body in said vessel with microwave energy of about said predetermined frequency for a time sufficient to raise the temperature of the body to said temperature effective for sintering said particles of sinterable material; and



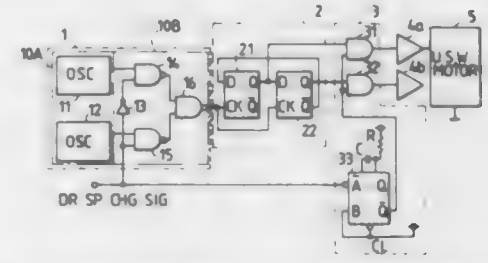
raising pressure in said vessel to said pressure of at least 20,000 psi to pressurize said body isostatically.

5,010,221

MICROWAVEABLE COFFEE MAKERS

M. Gary Grossman, Riverside, Conn., and Edward H. Meisner, Short Hills, N.J., assignors to GEE Associates, Edgewater, N.J.

Filed Jun. 11, 1990, Ser. No. 535,724
Int. Cl.[5] H05B *6/80*
U.S. Cl. 219—10.55 E **8 Claims**



1. A drip-type coffee maker adapted to discharge freshly brewed coffee, comprising:
a reservoir for holding water to be heated to a temperature for brewing coffee,
a coffee filter element adapted to hold coffee grounds and to receive the heated water from said reservoir and dispense freshly brewed coffee therefrom, and
a partition between said reservoir and said coffee filter element, including a body having at least one aperture therein, a member adapted to cover said aperture, and a non-toxic heat responsive sealing substance adapted to releasably secure said member to the underside of said body and over said aperture to seal said opening until water in said reservoir reaches a temperature for brewing coffee, whereupon said heat responsive substance is adapted to release said member from said body which drops therefrom into said coffee filter element to open said aperture to the flow of heated water therethrough and into said filter element and the coffee grounds to become freshly brewed coffee ready for dispensing from the coffee maker.

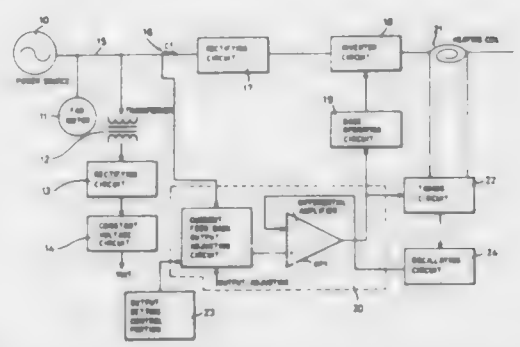
DRIVING DEVICE FOR ULTRASONIC WAVE MOTOR

Ryoichi Suganuma, Yokohama, Japan, assignor to Nikon Corporation, Tokyo, Japan

Filed Jun. 5, 1990, Ser. No. 533,410
Claims priority, application Japan, Jun. 8, 1989, 1-146261
Int. Cl.[5] H01L *41/08*
U.S. Cl. 318—116 **7 Claims**



1. A driving device for an ultrasonic wave motor provided with:
a stator member having an electrostrictive member and a resilient member and adapted to generate a travelling vibration wave in said resilient member by excitation with said electrostrictive member; and
a moving member maintained in pressure contact with said stator member and driven by said travelling vibration member; comprising:
drive signal forming means for forming AC voltage signals for high-speed drive and low-speed drive, for application to said electrostrictive member;
wherein said electrostrictive member is excited into vibration by said AC voltage signal;
switch means for selectively switching the AC voltage signals of high-speed drive and low-speed drive for application to said electrostrictive member; and
temporary stop means for reducing the frequency of the AC voltage signal, applied to said electrostrictive member, to zero at least once at the switching from the high-speed drive state to the low-speed drive state.

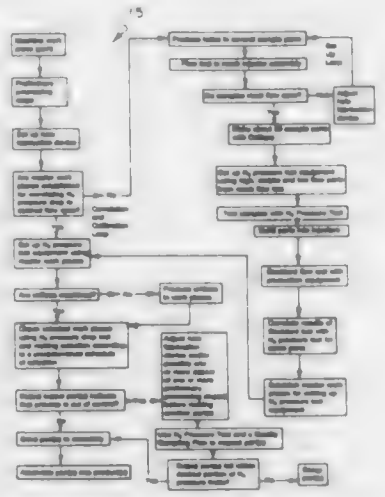
5,010,223

OUTPUT CONTROL CIRCUIT OF A 4-BURNER ELECTRONICS INDUCTION HEATING COOK SYSTEM AND A CONTROL METHOD THEREOF

Jeong Y. Kim, Seoul, Rep. of Korea, assignor to Sang Wook Suh International, Seoul, Rep. of Korea

Filed May 31, 1989, Ser. No. 358,809
Claims priority, application Rep. of Korea, May 31, 1988, 6536/88
Int. Cl.[5] H05B *6/08*
U.S. Cl. 219—10.77 **3 Claims**

1. A system for controlling the output of an electronic induction heating cook system, the system comprising;
(1) means for rectifying the AC current of a power source;



(2) an invertor circuit connector to said rectifying means for applying a frequency voltage to at least one heating coil;
(3) an output control means provided with a current feedback/output adjusting circuit and a pulse width modulation circuit, said current feedback/output adjusting circuit for monitoring a detected current from said power source and for outputting either a first signal if said detected current is more than a predetermined value or a second signal if the detected current is less than said predetermined value, and said pulse width modulation circuit for receiving said first signal or said second signal from said current feedback/output adjusting circuit and for receiving a triangular wave;
(4) a base operating means connected to an output of said output control means, said base operating means for controlling the operation of said invertor circuit according to said output;
(5) a timing circuit connected to said output of said output control means, said timing circuit for generating a pulse cycle having a predetermined time constant,
(6) a wave oscillating circuit for generating said triangular wave corresponding to said pulse cycle of said timing circuit; and
(7) an output setting control portion connected to said feedback/output adjusting circuit, said output setting control portion for setting said predetermined value via a selecting key corresponding to a desired heating level for said at least one heating coil, said output setting control portion comprising a microprocessor for generating a predetermined output according to a selection of said selecting key and comprising a decoder connected to said microprocessor for receiving said predetermined output and for optically controlling photocouplers connected in parallel to said decoder in a logical OR configuration, and said photocouplers for adjusting said predetermined value.

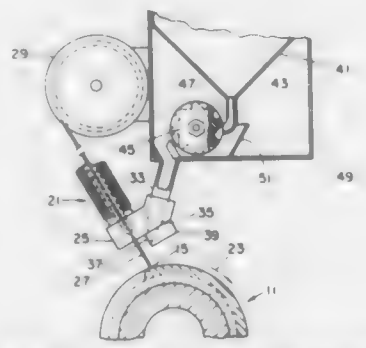
VERY SMALL ORIFICE MANUFACTURING SYSTEM

Roy D. Shirey, Laurens; Michael T. Nelson, and Robert J. Laurenzi, both of Taylors, all of S.C., assignors to Lucas Industries, plc, United Kingdom

Filed Jun. 12, 1989, Ser. No. 365,258
Int. Cl.[5] B23H *9/14, 7/20*
U.S. Cl. 219—69.17 **21 Claims**



17 A method for manufacturing a small orifice in each of a succession of production work pieces destined for assembly into a desired product, wherein the desired product performs according to a preselected flow specification, the method comprising the steps of:
(a) establishing a correlation between the desired flow performance of the production work piece and a test gas pressure associated with the flow through the orifice of the production work piece by the steps including
(i) machining an orifice through each work piece in a group including about 30 sample work pieces,
(ii) taking gas pressure data associated with the flow of the test gas through each of the machined orifices of the sample work pieces,
(iii) assembling each of the sample work pieces into at least one desired product,
(iv) test flowing each of the assembled products with the actual fluid or a close simulation of the actual fluid, and
(v) correlating the results of the fluid tests of the assembled products with the sample workpieces with the results of the gas pressure tests of the unassembled sample workpieces to produce a correlation of test gas pressure values versus fluid flow values for the desired product,
(b) machining an orifice through each production work piece;
(c) connecting a test gas pressure source via a gas pressure gauge to discharge through said orifice of each said production work piece chosen according to a statistical process control plan;
(d) measuring on said gauge the gas pressure measurement related to flow through each said orifice so chosen, and
(e) using said correlation and said gauge pressure measurement to determine whether said chosen orifice satisfies the preselected flow specification.

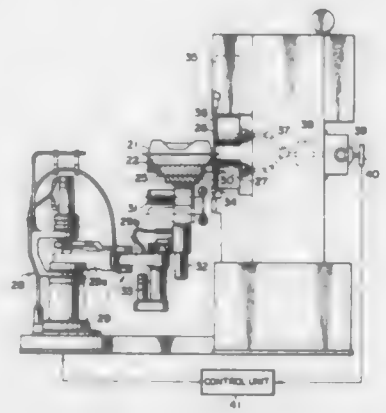
TOOL JOINT AND METHOD OF HARDFACING SAME

Frank J. Carlin, Houston, Tex., assignor to Grant TFW, Houston, Tex.

Filed Sep. 15, 1989, Ser. No. 408,074
Int. Cl.[5] B23K *9/04*
U.S. Cl. 219—76.12 **9 Claims**



1. A method of applying grooved bands of hardsurfacing on a tool joint for earth boring drill pipe, the hardfacing having tungsten carbide granules in an alloy steel matrix, the method including the steps of rotating the tool joint, providing an arc between an electrode and the tool joint to create a weld puddle, reciprocating the electrode parallel to the tool joint axis, and feeding granules into the weld puddle, the improvement comprising:
(1) applying the weld puddle within a groove around the exterior of the tool joint to a groove depth of from between about 0.75 inches to about 0.150 inches;
(2) discontinuing the feed of the granules into the weld puddle; and
(3) continuing the application of the weld puddle around the tool joint and in the grooves to provide a protruding substantially tungsten carbide free hardfacing surface above the outer diameter of the tool joint of from between about 0.050 inches to about 0.175 inches.

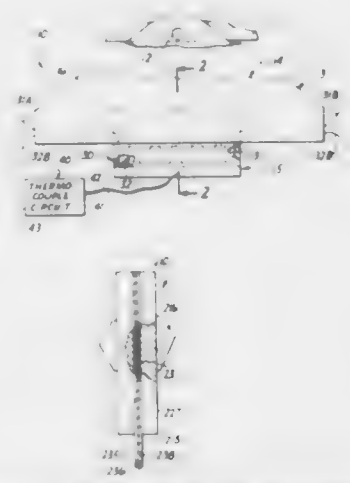
AUTOMATIC SEAM WELDING APPARATUS

Kazuhiro Sato; Tomomi Kishi; Koji Umeda; Yasushi Uchida, and Masahiko Takeuchi, all of Toyota, Japan, assignors to Toyota Jidosha Kabushiki Kaisha, Toyota, Japan

Filed Sep. 6, 1989, Ser. No. 403,400
Claims priority, application Japan, Sep. 28, 1988, 63-240678
Int. Cl.[5] B23K *11/06*
U.S. Cl. 219—81 **12 Claims**

1. An apparatus for seam welding overlapping peripheral flange portions of two workpieces disposed one on top of the other to form a tank, the apparatus comprising:
a base;
a pair of roller electrodes rotatably mounted to the base, the electrodes having opposing peripheral surfaces for nipping and seam welding the overlapping peripheral flange portions of workpieces disposed therebetween;
means for sensing the diameter of one of the roller electrodes;
a jig for holding the two disposed workpieces;
a robot assembly mounted to the base, the robot assembly including an articulate arm, the arm being manipulatable in the horizontal, vertical, and inclined planes, means for moving the outer end of the arm in horizontal, vertical and inclined planes relative to the opposing surfaces of the pair of electrodes for maintaining the flange of the tank in the desired welding orientation in accordance with the sensed diameter of said roller electrode and regardless of the inclination and variation of the flange portion of the tank in the horizontal and vertical planes;
means for detachably and rotatably mounting the jig to the outer end in the bore of the arm; and
control means including means for seam welding the peripheral flange portions of workpieces held by the jig during feeding of the flange portions between the opposite electrode surfaces.



5,010,227

SOLDERING APPARATUS AND METHOD OF USING THE SAME

Thomas W. Todd, 10515 Earthstar Ct., San Diego, Calif. 92127

Filed Feb. 15, 1989, Ser. No. 311,655
Int. Cl.[5] B23K *1/02, 11/30;* H05B *3/42*
U.S. Cl. 219—85.16 **20 Claims**

1. A soldering apparatus including a soldering head, comprising:
thermod means for heating uniformly a solder material to form a substantially uniform solder joint;
said thermod means including conductor means for transferring thermal energy to said solder material, said conductor means being generally a thin flat elongated plate composed of a thermally conductive electrically insulative material;
said thermod means including a pair of first and second heating elements for converting electrical energy to thermal energy to heat said plate to soldering temperatures;
said heating elements being disposed on opposite sides of said flat plate at a substantial distance from the bottom edge thereof;
said thermod means further including a pair of first and second elongated spacing members, each one being interposed between said plate and one of respective first and second heating elements for isolating electrically said heating elements from said plate to inhibit electrical current from flowing in said plate and for permitting heat flow from said heating elements to said plate;
said thermod means further including a pair of first and second heat confining elongated members for directing the thermal energy generated by said heating elements toward said plate, said heat confining members being composed of a thermally and electrically non-conductive material;
said first and second heat confining elongated members being spaced apart on opposite sides of said plate engaging

the respective first and second heating elements for directing the thermal energy generated thereby toward said plate;
said plate depending downwardly between said first and second spacing members terminating in a bottom edge having a substantially flat surface throughout its entire longitudinal length for transferring uniformly thermal energy to said solder material;
holding means disposed in a spaced apart manner relative to said conductor means for securing the conductor means and the heating means relative to the soldering head and for thermally insulating the soldering head from said heating means and said conductor means;
wherein said holding means includes insulating means for electrically and thermally insulating said thermod means from the soldering head;
said insulating means including means for securing said thermod means to the soldering head; and
said insulating means being an elongated block member for receiving a portion of said thermod means

TOOL CHANGER FOR WELDING ROBOT

Toshihiro Nishiwaki, Kanagawa, Japan, assignor to Obara Corporation, Tokyo, Japan

Filed Dec. 9, 1988, Ser. No. 282,601
Claims priority, application Japan, Dec. 28, 1987, 62-329426; Feb. 16, 1988, 63-31823; Oct. 25, 1988, 63-26705
Int. Cl.[5] B23K *11/00*
U.S. Cl. 219—86.25 **5 Claims**

1. A tool changer for a welding robot, comprising:
a first base plate associated with a robot arm and a second

base plate associated with a tool member, a plurality of first connector parts supported on said first base plate, said first connector parts being adapted to supply at least one of fluid and electricity to the tool member from the robot arm, a plurality of second connector parts supported on said second base plate, said second connector parts being adapted to receive at least one of fluid and electricity from said first connector parts, each said first connector part being adapted to mate with and form a connection with a respective said second connector part, said connector parts being arranged such that respective pairs of said connector parts mate when said base plates are disposed in a predetermined relationship adjacent one another, each

said base plate having a substantially cylindrical coupler element extending therefrom and a yoke fixedly attached thereto, each said yoke having a central opening therethrough and a plurality of fixing elements extending radially outwardly from said central opening, said cylindrical coupler elements being respectively received in said central openings of said yokes, at least some of said first connector parts being carried in groups on platelike first connector units which are detachably mounted on respective said fixing elements associated with said first base plate, and at least some of said second connector parts being carried in groups on platelike second connector units which are detachably mounted on respective said fixing elements associated with said second base plate.

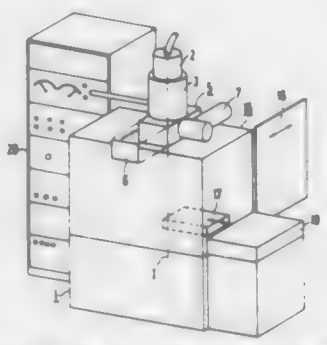
APPARATUS FOR ELECTRON BEAM WELDING OF WORKPIECES

Hans Lamatsch, Heroldsberg, and Dieter Vanek, Nüremberg, both of Fed. Rep. of Germany, assignors to Siemens Aktiengesellschaft, Berlin & Munich, Fed. Rep. of Germany



PCT No. PCT/DE88/00732, § 371 Date May 24, 1990, § 102(e) Date May 24, 1990, PCT Pub. No. WO89/05206, PCT Pub. Date Jun. 15, 1989

PCT Filed Nov. 25, 1988, Ser. No. 477,958

Claims priority, application Fed. Rep. of Germany, Nov. 30, 1987, 3740552

Int. Cl.[5] B23K *15/00*

U.S. Cl. 219—121.21 **5 Claims**

1. An apparatus for welding workpieces with electrons comprising:

an electron beam generator having a beaming direction axis;

a first workpiece chamber having a small volume and a second workpiece chamber having a large volume connected to one another via a slide valve located in the beaming direction axis region;

a vacuum pump for evacuating said first and second chambers, said vacuum pump being coupled only to said first chamber having said small volume;

said first chamber having said small volume being adjacent to said electron beam generator and said second chamber having said large volume following adjacent to said first chamber;

each of said first and second chambers having separate access doors, whereby each chamber can be loaded with workpieces independent of one another;

said first chamber with said smaller volume serving for fast welding of relatively small workpieces, and said second chamber with said large volume serving for welding of relatively large workpieces.

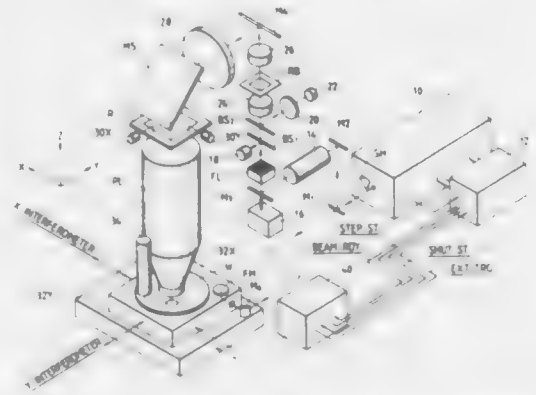
LASER PROCESSOR



Tsunesaburo Uemura, Tokyo, Japan, assignor to Nikon Corporation, Tokyo, Japan

Filed Jul. 20, 1990, Ser. No. 554,840

Claims priority, application Japan, Jul. 24, 1989, 1-190862

Int. Cl.[5] B23K *26/00*

U.S. Cl. 219—121.62 **2 Claims**

1. In a laser processor provided with a pulse oscillating laser light source, excitation means for exciting said laser light source in response to a trigger signal for pulse oscillation, beam quality adjusting means for adjusting a beam quality of a laser light within a preset standard as monitoring the pulse-oscillated laser light at least partly, a working apparatus for exposing or processing a workpiece by projecting the adjusted laser light thereon, the improvement comprising:

a screening member for cutting off an optical path of said laser light to the workpiece when said working apparatus interrupts an operation using said laser light for a predetermined period of time or over;

trigger control means for impressing said trigger signal on said excitation means in a low frequency band necessary for said beam quality adjusting means to stabilize a beam quality of said laser light while the screening member cuts off the optical path;

abnormal detecting means for generating a quality abnormal signal when detecting a beam quality of said laser light coming under a standard necessary for said exposure or processing;

correction means for keeping a cut-off operation of said screening member when the quality abnormal signal is generated, and correcting a frequency band of the trigger signal to be impressed on said excitation means to the low frequency band set by said trigger control means or over

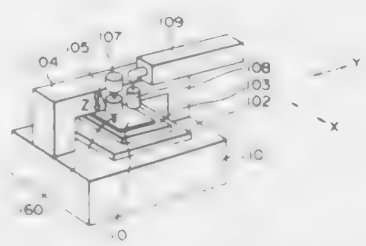
METHOD OF AND APPARATUS FOR PERFORATING PRINTED CIRCUIT BOARD



Kunio Arai, Atsugi, and Yasuhiko Kanaya, Machida, both of Japan, assignors to Hitachi Seiko, Ltd., Ebina, Japan

Filed Jan. 23, 1990, Ser. No. 468,914

Claims priority, application Japan, Jan. 27, 1989, 01-016157

Int. Cl.[5] B23K *26/00*

U.S. Cl. 219—121.7 **14 Claims**

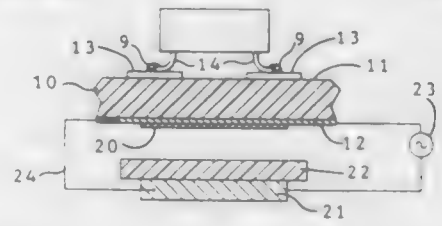
1. A method of perforating a printed circuit board having a copper foil layer on one side thereof, at least one intermediate resin layer and a layer on the other side thereof, so as to form a connection hole for providing an electrical connection between said copper foil layer and said layer on the other side of said printed circuit board, said method comprising:

preparing a printed circuit board perforation apparatus which has a laser processing head capable of processing said printed circuit board by means of a laser beam and a drill head capable of drilling said printed circuit board;

conducting drilling into said resin layer through said copper foil layer by said drilling head so as to form a pilot hole; and

irradiating through said pilot hole a laser beam by said laser processing head to the portion of said resin layer remaining at the bottom of said pilot hole so as to remove the resin, thereby forming said connection hole reaching said layer on the other side of said printed circuit board.

5,010,233



SELF REGULATING TEMPERATURE HEATER AS AN INTEGRAL PART OF A PRINTED CIRCUIT BOARD

Homer E. Henschen, Carlisle; Michael J. McKee, New Cumberland, and Joseph M. Pawlikowski, Lancaster, all of Pa., assignors to AMP Incorporated, Harrisburg, Pa.

Filed Nov. 29, 1988, Ser. No. 277,095

Int. Cl.[5] H05B *3/12, 6/10*

U.S. Cl. 219—209 **19 Claims**

1 An article containing portions to be heated by delivery of sufficient thermal energy to at least one connection site to melt electrically-conductive fusible material at the connection site, said apparatus comprising:

a support structure comprising an electrically-insulative thermally conductive circuit board having first and second opposite board surfaces spaced by a board thickness dimension, with at least one contact pad secured to said circuit board at said connection site, said pad being disposed on said first board surface;

a selectively energizable self-regulating heater for generating said sufficient thermal energy, said heater having a thermally-conductive portion permanently secured to said support structure in spaced proximity to said connection site to permit thermal energy generated by said heater to be conducted to said connection site through the circuit board, said heater having a substrate of electrically and thermally conductive non-magnetic substrate material having first and second opposite surfaces, the substrate disposed over the entirety of said second surface of said circuit board and secured to said circuit board with the second substrate surface against the second board surface, a surface layer of magnetic surface layer material affixed to said substrate on less than the entirety of said first substrate surface, said surface layer aligned with said pad through the thickness of said circuit board, said surface layer material being electrically and thermally conductive but having a much greater electrical resistance than said substrate material, wherein said self-regulating heater is energizable by passing a constant amplitude alternating current of known frequency therethrough and the depth of said surface layer on said first surface of said substrate is approximately one skin depth at said known frequency, whereby current through said heater is concentrated in said surface layer at temperatures below the Curie temperature of said surface layer material and expands into said substrate material at temperatures equal to and above said Curie temperature.

DEVICE FOR AIR-CONDITIONING PREMISES WITH EXCHANGE OF HEAT ENERGY BY LOW TEMPERATURE INFRARED RADIATION

Fernand Scherrer, 2 rue Georges Bizet, 68170 Rixheim, and Joseph Rousset, 22 rue des Ecoles, 75005 Paris, both of France

Filed Dec. 2, 1988, Ser. No. 279,432

Claims priority, application France, Dec. 4, 1987, 87 16891; Jun. 23, 1988, 88 08461

Int. Cl.[5] H05B *3/34*

U.S. Cl. 219—213 **20 Claims**

1. A device for air-conditioning premises, with exchange of heat energy by low temperature infrared radiation, comprising:

three suspended elements, the first suspended element being a reflector element, the second suspended element being a flat heat exchanger element, and the third suspended element being a first sheet;

said flat heat exchanger element exchanging heat energy by low temperature infrared radiation, said flat heat exchanger element extending parallel to a wall of the room and being spaced therefrom, said flat heat exchanger element being a low temperature infrared radiation emitter and including an assembly of juxtaposed individual films fixed to one another to form a second sheet;

said reflector element being positioned between said heat exchanger element and the wall, said reflecting element reflecting the low temperature infrared radiation,

said individual films being fixed on an incombustible cloth having a weft permitting optimum passage of the infrared radiation, said cloth having a mesh such that the nature and dimensions thereof are such that in the event of a fire affecting said films, the association by adhesion or welding of said films on the incombustible support cloth limits the propagation of the flames and avoids the melting material dropping onto the occupants of the premises, by retention in the meshes of the weave of the cloth;

said first sheet facing and being disposed towards the interior of the room and being stretched across the room, said first sheet being made of a material behaving in a diathermic manner with respect to the low temperature infrared radiation, said heat exchanger element and said reflector element, and

means hooking each of said first and said second sheets along their edges to walls of the room.

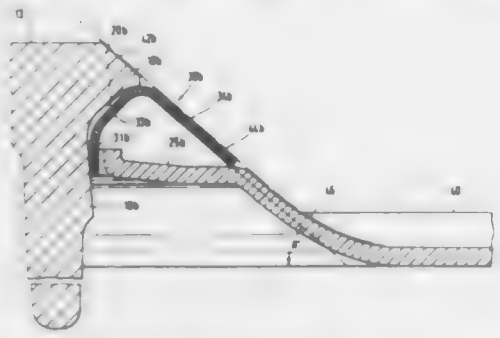
ELECTRIC COOKER PLATE



Karl Fischer, deceased, late of Oberderdingen; Gerhard Borst, executor, Enzlingen-Liebersbronn; Heinz Treffinger, executor, and Dorothee Fischer, executrix, both of Oberderdingen, all of Fed. Rep. of Germany, assignors to E.G.O. Elektro-Gerate Blanc u. Fischer, Oberderdingen, Fed. Rep. of Germany

which is a continuation-in-part of Ser. No. 968,047, Dec. 8, 1978, abandoned. This application Apr. 28, 1989, Ser. No. 345,111

Claims priority, application Fed. Rep. of Germany, Dec. 14, 1977, 2755806; Dec. 14, 1977, 2755807

Int. Cl.[5] H05B *3/70*

U.S. Cl. 219—455 **13 Claims**

1. An electric cooker comprising:

a fitting plate having an opening surrounded by an upwardly directed rim, the rim being surrounded by a shoulder and the shoulder being surrounded by a rounded section;

a cooker plate disposed in the opening and having a cooking surface on which a cooking vessel can be stood; and,

a sheet metal ring surrounding the cooker plate, and projecting beyond the cooker plate, the ring having an irregular U-shaped cross-section with a radial internal section fixed to the outer rim surface of the cooker plate, and a radial external section which overlaps the rim of the fitting plate, wherein:

(a) the external section of the sheet metal ring is arranged and bevelled in such a way that the outermost edge of the cooker plate, the external section of the ring and the rounded section of the fitting plate lie substantially on and define a common curve,

(b) the maximum inclination of the curve relative to horizontal is not more than 45°,

(c) the external section of the ring rests with linear contact on the shoulder of the fitting plate, adjacent to the rounded section; thereby forming a transition, enabling the cooking vessel to be pushed smoothly from the cooking surface onto the fitting plate, and

(d) the height of the ring is less than 5 mm.

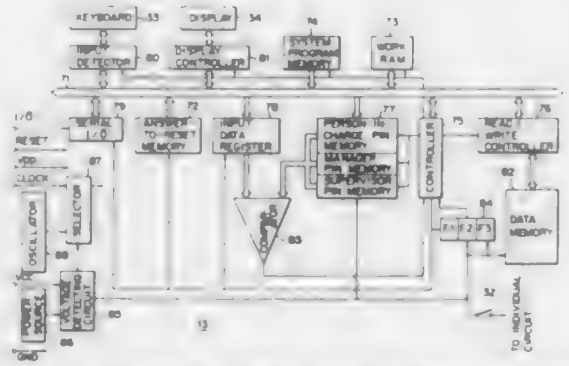
IC CARD SYSTEM FOR PREVENTING UNAUTHORIZED DATA ALTERATION



Shigeyuki Kawana, Tokyo, Japan, assignor to Casio Computer Co., Ltd., Tokyo, Japan

Filed Apr. 6, 1988, Ser. No. 178,237

Claims priority, application Japan, Apr. 10, 1987, 62-87070; Jul. 24, 1987, 62-112703[U]

Int. Cl.[5] G06F *15/30*

U.S. Cl. 235—379 **15 Claims**

1 An IC card system having an IC card and a terminal unit used for processing transaction data generated in association with use of said IC card, said system comprising:

(a) an IC card including:

memory means for storing at least first PIN (personal identification number) data and second PIN data;

input means for entering PIN data;

collation means for comparing PIN data from said input means with said first and second PIN data stored in said memory means to detect coincidence therebetween;

data memory means for storing data inputted from said terminal unit;

first and second storage means for respectively storing first and second permission data each of which represents an allowable operation of said terminal unit;

control means for inputting said first permission data into said first storage means and clearing said second storage means when a coincidence between the first PIN data and the entered PIN data is detected by said collation means, and for inputting said second permission data into said second storage means and clearing said first storage means when a coincidence between the second PIN data and the entered PIN data is detected by said collation means; and

(b) a terminal including:

data input means for inputting transaction data into said data memory means of said IC card on condition that said first storage means has the permission data stored in it; and

transferring means for retrieving the stored transaction data from said data memory means of said IC card and transferring the retrieved transaction data to a host computer coupled thereto on condition that said second storage means has the second permission data stored in it.

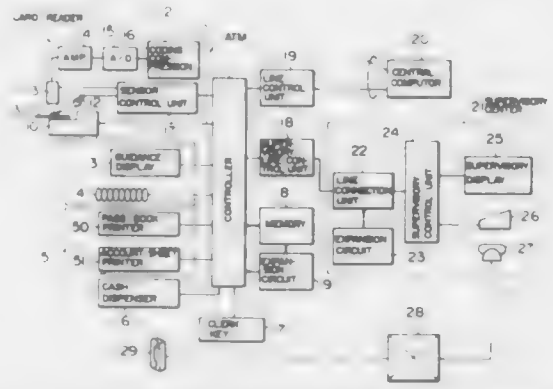
AUTOMATIC CASH TRANSACTION SYSTEM AND METHOD



Osamu Kadono, Kasugai, and Kunio Ushizima, Seto, both of Japan, assignors to Hitachi, Ltd., Tokyo, Japan

Filed Jan. 31, 1989, Ser. No. 304,095

Claims priority, application Japan, Mar. 18, 1988, 63-63278; Apr. 15, 1988, 63-93123

Int. Cl.[5] G06F *15/30*

U.S. Cl. 235—379 **16 Claims**

1. An automatic cash transaction system comprising a plurality of automated teller machines and a supervisory center for supervising the automated teller machines, wherein cash transactions are performed using an identification card which stores an index representative at least of the number of a user's account,

each of said plurality of automated teller machines comprising:

guidance display means for displaying a guidance such as a transaction operation guidance;

optical information reading means for taking a surface image information of said identification card as a digital information;

operation means for inputting necessary data for a current transaction operation, and designating a particular past transaction;

data storing means for digitally storing for each transaction the surface image information of said identification card obtained by said optical information reading means and said corresponding transaction information including said data inputted from said operation means as an electronic journal; and

control means for reading out the surface image information of an identification card associated with a past transaction information stored in said data storing means designated by said operation means to display said surface information on said guidance display means, and capable of sending a current transaction information including said data inputted from said operation means and the surface image information of said identification card to said supervisory center when said control means detects a transaction failure; and

said supervisory center comprising supervisory display means for displaying thereon said current transaction information and identification card surface information sent from said control means, and supervisory control means for reading out said electronic journal of past transaction stored in said data storing means to display on said supervisory display.

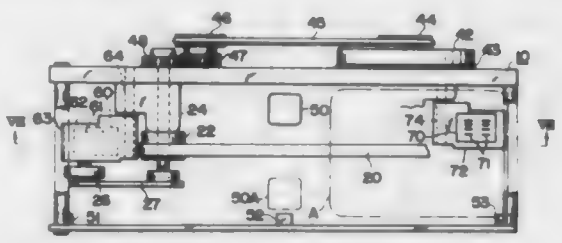
IC CARD READER/WRITER



Katsuya Mita, Kyoto, Japan, assignor to Omron Tateisi Electronics Co., Kyoto, Japan

Filed Oct. 4, 1988, Ser. No. 253,036

Claims priority, application Japan, Oct. 9, 1987, 62-155056[U]

Int. Cl.[5] G06F *7/06*

U.S. Cl. 235—441 **3 Claims**

1. An IC card reader/writer comprising:

an IC card inserting port:

an IC card conveying apparatus extending from said IC card inserting port to an inside of the IC card reader/writer;

a first connector having contact members and disposed near one end of said IC card conveying apparatus, the first connector being adapted to electrically connect with an IC card of first kind of format; and

a second connector having contact members and disposed near other end of said IC card conveying apparatus, the second connector being adapted to electrically connect with an IC card of second kind of format.

COMPOSITE TICKET PROCESSING UNIT

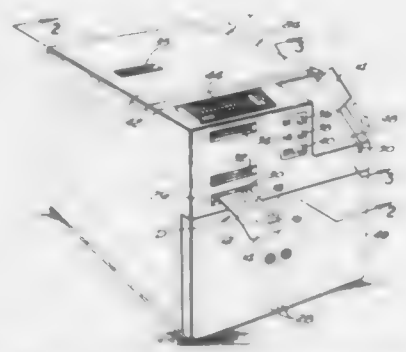
Dunstan P. Sheldon, Altadena, Calif., assignor to Mag-Tek, Inc., Carson, Calif.

Filed Apr. 11, 1989, Ser. No. 336,401

Int. Cl.[5] G06K *5/00, 7/00;* **G06F** *15/20;* **B26D** *7/06*

U.S. Cl. 235—382 **10 Claims**

1. A terminal for processing composite documents severable into plural sections, as including a ticket and a pass, said documents having a machine-readable record as a magnetic stripe, said terminal comprising:



a housing defining a document input port, at least one exit port, at least one collection bin, and a channel slot for guiding the movement of a passing document section;

document track means affixed in said housing to transport

document sections from said input port alternatively to a collection bin or an exit port;

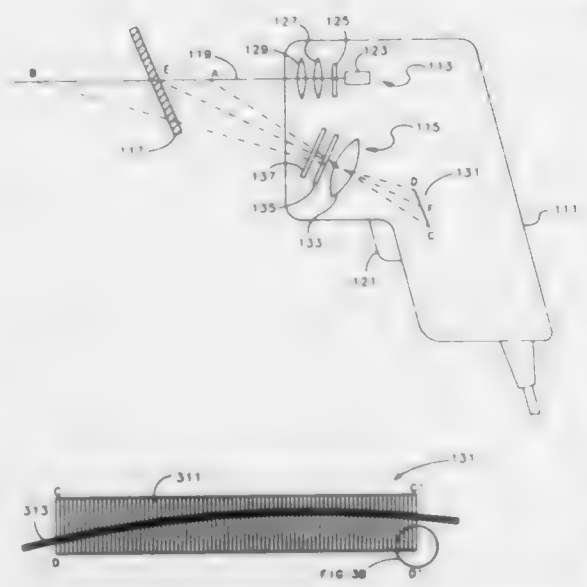
a sensor fixed in said housing in the proximity of said track means to read and process data from said document sections;

a document burster affixed contiguous to said track means at a location beyond said sensor for separating said document into sections;

a second sensor affixed contiguous to said channel slot to read and process one of the document sections separated by the burster as it passes through said channel slot, and

a control unit connected to said first and second sensors to control said track means, said burster and to provide indications of document acceptability.

5,010,241



SENSOR ARRAY AND ILLUMINATION SYSTEM FOR A LARGE DEPTH-OF-FIELD BAR CODE SCANNER

Mark M. Butterworth, Santa Clara, Calif., assignor to Hewlett-Packard Company, Palo Alto, Calif.

Filed Jan. 12, 1989, Ser. No. 296,997

Int. Cl.[5] G06K *7/10, 7/14*

U.S. Cl. 235—462 **42 Claims**

1. An optical system for a bar code scanner for reading a bar code tag, comprising:

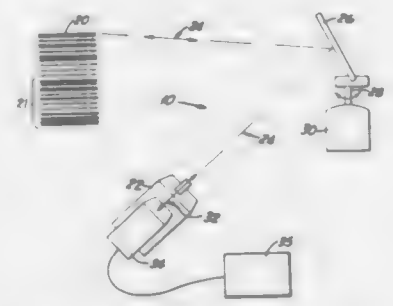
a focusing means having an optical axis;

illumination means for projecting a sheet of light along an object plane at a first acute angle with respect to a plane perpendicular to the optical axis of the focusing means, for illuminating a strip on the bar code tag to be read, and

a detector array for receiving light reflected from the bar code tag, with a plurality of elements having a long axis and a short axis, positioned substantially in an image plane at a second acute angle with respect to a plane perpendicular to the optical axis of the focusing means, with the long axis of the elements arranged substantially perpendicular to the image of the illuminated strip of the bar code tag, the projection of the long axis of the elements of the detector array onto the object plane defining the working range of the optical system;

a plane through the focusing means perpendicular to the optical axis of the focusing means, the image plane and the object plane all intersecting along a line so that an image of the illuminated strip of the bar code tag is formed substantially in focus on the detector array when the bar code tag is within the working range of the optical system.

5,010,242



METHOD AND APPARATUS FOR VARIABLE SPEED SCANNING OF BAR CODES

Louis J. Frontino, Cherry Hill, N.J., assignor to Mars Incorporated, McLean, Va.

Filed May 8, 1989, Ser. No. 349,090

Int. Cl.[5] G06K *7/10*

U.S. Cl. 235—467 **27 Claims**

1. An apparatus for variable speed scanning of an optically readable code, comprising:

means for generating a light beam;

means for deflecting said light beam across an optically readable code target, said code reflecting at least a portion of said light beam back toward said apparatus;

means operatively connected to said deflecting means for automatically controlling the rate at which said light beam is deflected across said object so that the optically readable code is first scanned at a first scan velocity and then is scanned a second time at a second scan velocity; and

means for processing said reflected portion of said light beam to decode the optically readable code target.

5,010,243

METHOD OF PRODUCING AN OPTICAL RECORDING CARD HAVING A HOLOGRAM CONTAINED THEREIN

Yoichi Fukushima; Minoru Fujita; Yuji Kakinuma, and Toshio Haga, all of Tokyo, Japan, assignors to Kyodo Printing Co., Ltd., Tokyo, Japan

Division of Ser. No. 108,473, Oct. 14, 1987, Pat. No. 4,945,215. This application Apr. 14, 1989, Ser. No. 338,713

Claims priority, application Japan, Oct. 15, 1986, 61-244995; Oct. 24, 1986, 61-163468

Int. Cl.[5] G06K *19/16, 19/18*

U.S. Cl. 235—488 **11 Claims**

1. A method of producing an optical recording card having a hologram contained therein, the card comprising a transparent front substrate of which an inside surface includes a hologram portion building area and an optical recording portion building area, said hologram portion building area being formed with a pattern of concavity and convexity in the form of interference fringe of hologram, a reflective metallic film covering said pattern of concavity and convexity, an optical recording pattern layer comprising a metallic film for covering said optical recording portion building area, and wherein said optical recording card includes a rear substrate adapted to be adhered to said front substrate in the form of sandwiching a reflective metallic film and said optical recording pattern layer, the method comprising the steps of

die pressing said pattern of concavity and convexity in the form of an interference fringe in said hologram portion building area of said transparent front substrate,

forming a reflective metallic film over said hologram portion building area and said optical recording portion building area of said front substrate after completion of said step of die pressing,

patterning reflective metallic film on the optical recording portion building area of said front substrate in accordance with an optical recording pattern after completion of said step of forming the reflective film,

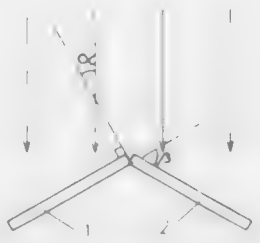
adhering said rear substrate to said inside surface of said front substrate in the form of sandwiching said reflective metallic film after completion of said step of patterning, and

die punching both said front and said rear substrates to a shape of said optical recording card after completion of said step of adhering.

5,010,244

METHOD TO DETECT RADIATION AND MEASURE ITS ANGLE OF INCIDENCE AND A DETECTOR ARRANGEMENT TO CARRY OUT THE METHOD

Kurt Nissborg, Skäninge, Sweden, assignor to Forsvarets Forskningsanstalt, Stockholm, Sweden



PCT No. PCT/SE88/00646, § 371 Date Jul. 20, 1989, § 102(e) Date Jul. 20, 1989, PCT Pub. No. WO89/04972, PCT Pub. Date Jun. 1, 1989

PCT Filed Nov. 25, 1988, Ser. No. 392,529

Claims priority, application Sweden, Nov. 27, 1987, 8704739

Int. Cl.[5] H01J *40/14*

U.S. Cl. 250—206.1 **8 Claims**

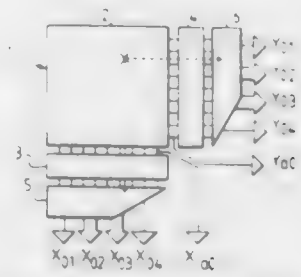
1. A method for detecting short pulses of speckled radiation caused by a turbulent atmosphere, and to measure its angle of incidence in relation to a reference direction comprising the steps of:

placing at least two detectors so they receive an irradiance that is essentially uncorrelated in the case of speckled radiation wherein the detectors are comprised of two detector elements, mounted so both detector elements receive essentially the same irradiance and in a direction that the normals of respective detector elements form a known angle with each other; and

calculating the angle of incidence using signals from the detector elements that depend on the shape of the sensitivity beams, and said angle between the detector elements.

5,010,245

RADIATION TRANSDUCING DEVICE WITH LOCATION IDENTIFICATION



Bart M. H. L. Dierickx, Mortsel, Belgium, assignor to Interuniversitair Micro-Elektronica Centrum VZW, Belgium

Filed May 25, 1989, Ser. No. 356,800

Claims priority, application Netherlands, May 25, 1988, 8801342

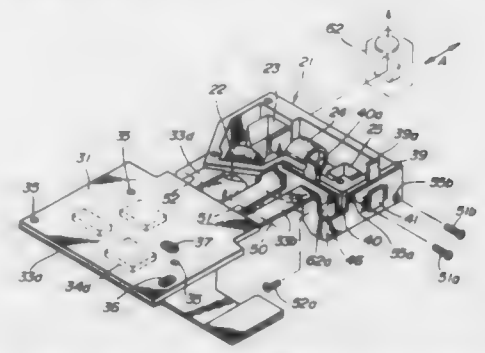
Int. Cl.[5] H01J *40/14*

U.S. Cl. 250—208.1 **14 Claims**

1. A radiation transducing device for transducing radiation, comprising: an array of radiation sensitive elements, comparator elements connected to at least a portion of said array for comparing the amount of radiation received by the radiation sensitive elements to a predetermined threshold value, encoding element connected to said comparator elements for producing an output effective for identifying the location of said radiation sensitive elements which have been exposed to radiation and measuring means connected to said radiation sensitive elements for determining the amount of incident radiation collected in an element during a predetermined time period.

5,010,246

OPTICAL HEAD APPARATUS APPLICABLE TO OPTICAL DISC APPARATUS



Hiroshi Tsuyuguchi; Yasushi Noda, both of Tokyo; Tsutomu Morita, Mitaka, and Kenji Shimozawa, Sagamihara, all of Japan, assignors to TEAC Corporation, Japan

Filed Jan. 16, 1990, Ser. No. 464,975

Claims priority, application Japan, Jan. 18, 1989, 1-3939[U]

Int. Cl.[5] H01J *3/14, 5/16;* **G11B** *7/00*

U.S. Cl. 250—216 **8 Claims**

1. An optical head apparatus applicable to an optical disc apparatus, comprising:

a case body having an open surface and a window through which an opto-electronics component can be positioned and housing optical components inside it;

a lid being attachable and detachable with respect to the open surface of said case body; and

a flexible printed circuit board having a base portion which is adhered to said lid and on which electronic components are mounted, and a protruding portion protruding from said base portion and having an opto-electronic component fixed to the distal end portion of it, said opto-elec-

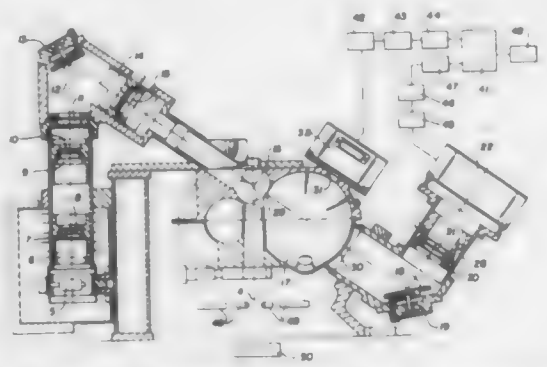
tronic component being electrically connected with an electronic circuit which is formed by said electronic component on said base portion of said flexible printed circuit board, the distal end portion of said protruding portion of said flexible printed circuit board being fixed to said case body so that said opto-electronic component is positioned to said window,

whereby, when said electronic circuit and said opto-electronic component are maintained in a status of electrical contact said lid can be attached and detached with respect to said case body due to the bending of said protruding portion of said flexible printed circuit board

---

5,010,247

METHOD OF CLASSIFYING OBJECTS ACCORDING TO SHAPE



Martin P. Smith, Wargrave, and Colin D. Saunders, Marlow, both of England, assignors to Spandrel Establishment, Vaduz, Liechtenstein

Filed Oct. 6, 1989, Ser. No. 418,265

Claims priority, application United Kingdom, Oct. 7, 1988, 8823570

Int. Cl.[5] G01N *9/04*; **B07C** *5/04*

U.S. Cl. 250—223 R **9 Claims**

1. A method of making a rough classification of objects according to shape, comprising:

passing the objects in succession through a viewing zone,

in the viewing zone, viewing each object with at least three viewers which view along angularly spaced axes and thereby sensing respective areas presented to said viewers whereby said viewers give signals representative of said respective presented areas, and

comparing said signals from each respective viewer to make a rough determination of the shape of the object

---

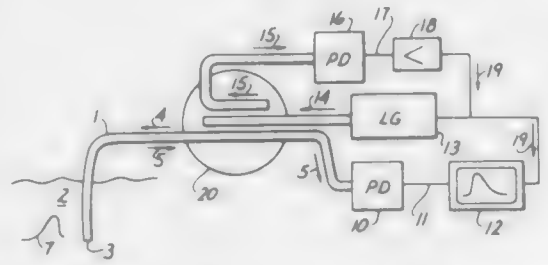
SAMPLING HYDROPHONE

Wolfgang Eisenmenger, Landhausstrasse 7, D-7140 Ludwigsburg, and Joachim Staudenraus, Bruchlstrasse 45, D-7303 Neuhausen, both of Fed. Rep. of Germany

PCT No. PCT/EP89/00053, § 371 Date Nov. 24, 1989, § 102(e) Date Nov. 24, 1989, PCT Pub. No. WO89/06512, PCT Pub. Date Jul. 27, 1989



PCT Filed Jan. 17, 1989, Ser. No. 411,479

Claims priority, application Fed. Rep. of Germany, Jan. 25, 1988, 3802024

Int. Cl.[5] H01J *5/16*

U.S. Cl. 250—227.21 **12 Claims**

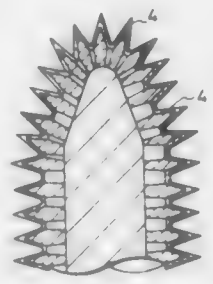
1. Hydrophone probe for measuring pressure amplitudes in a liquid medium (2) comprising, a light conductor in the form of an optical waveguide (1) having one end situated in the liquid medium; means connected on opposite end of the waveguide to be responsive to changes in the degree of reflection of light at the boundary 3 of said end and of liquid adjacent said end of the light conductor on account of pressure dependent changes in the relative index of refraction at said boundary and with reference to the liquid medium for being indicative of variable pressure amplitudes in said liquid medium, said means further including an optical reflection measuring device having a large

temporal resolution sufficient to respond to pressure variations beyond a megahertz range

---

5,010,249

DIAMOND PROBE AND FORMING METHOD THEREOF



Akira Nishikawa, Tokyo, Japan, assignor to Seiko Instruments Inc., Japan

Filed Sep. 13, 1989, Ser. No. 406,458

Claims priority, application Japan, Sep. 13, 1988, 63-228991

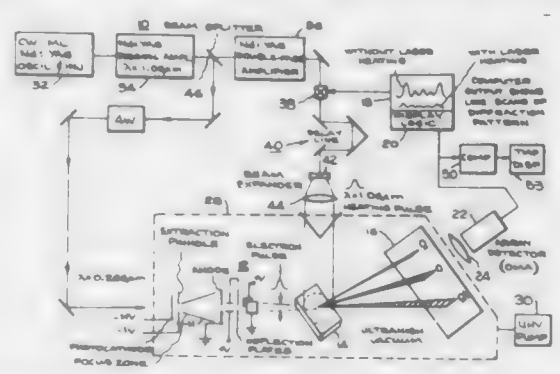
Int. Cl.[5] H01J *37/26*

U.S. Cl. 250—306 **2 Claims**

2. A diamond probe comprising: a probe material having a pointed tip on which to form a carbon film comprised of a mixture of a columnar diamond crystal and an amorphous carbonic component, and a conductive film coated on said carbon film.

5,010,250

SYSTEM FOR SURFACE TEMPERATURE MEASUREMENT WITH PICOSECOND TIME RESOLUTION



Hani E. Elsayed-Ali, Rochester, N.Y., assignor to The University of Rochester, Rochester, N.Y.

Filed Jan. 9, 1990, Ser. No. 462,376

Int. Cl.[5] H01J *37/295*

U.S. Cl. 250—310 **13 Claims**

1. A system for measuring the thermal characteristic of the surface lattice of solid state material which comprises means for generating successive pairs or groups of pairs of electron pulses and laser pulses which are synchronous with each other and are separated by successively greater periods of time, which pulses are incident on said surface of said material, means for detecting diffraction patterns produced by said electron pulses upon reflection from said surface, and means

responsive to said patterns for obtaining said thermal characteristic.

5,010,251

RADIATION DETECTOR ARRAY USING RADIATION SENSITIVE BRIDGES

Jan Grinberg, Los Angeles; Murray S. Welkowsky, Chatsworth; Chiung-Sheng Wu, Los Angeles, and Paul O. Braatz, Canoga Park, all of Calif., assignors to Hughes Aircraft Company, Los Angeles, Calif.

Division of Ser. No. 370,109, Jun. 21, 1989, Pat. No. 4,922,116, which is a continuation-in-part of Ser. No. 228,630, Aug. 4, 1988, abandoned. This application Jan. 11, 1990, Ser. No. 463,563

Int. Cl.[5] H01L *31/09*

U.S. Cl. 250—332 **46 Claims**

1. A two-dimensional sensing array for electromagnetic radiation (emr), comprising:

a substrate,

an array of emr detector cells in said substrate, each of said cells including an emr sensitive bridge structure spanning a portion of the cell, said bridge structure being shaped to form a generally thermally insulative gap between the bridge structure and substrate, and having a defined characteristic which varies in accordance with the amount of emr received by the bridge, and

means for monitoring said defined characteristic for each of said cells.

5,010,252

IONIZATION DETECTOR

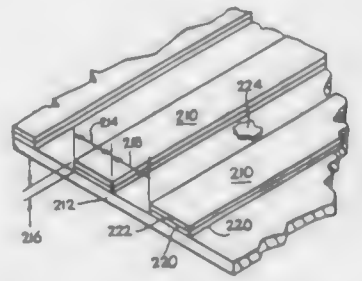
Douglas S. Steele, Saratoga Springs, N.Y., assignor to General Electric Company, Cincinnati, Ohio

Division of Ser. No. 565,670, Dec. 27, 1983, Pat. No. 4,613,313. This application Jun. 10, 1986, Ser. No. 872,588

The portion of the term of this patent subsequent to Sep. 23, 2003, has been disclaimed.

Int. Cl.[5] G01T *1/185*

U.S. Cl. 250—385.1 **16 Claims**



1. An ionization detector, comprising:

(a) a chamber containing xenon gas at a pressure exceeding 800 pounds per square inch;

(b) collimation means for collimating incoming radiation;

(c) window means for admitting collimated radiation into the chamber and for preventing escape of xenon from the chamber;

(d) an array of substantially parallel, elongated detector elements supported by a substrate and extending into the chamber and having a cross-sectional configuration inside the chamber which is substantially identical to the cross-sectional configuration outside the chamber, the array having metallic residue located in the spaces between the detector elements such that the cross-sectional area of the residue, when viewed from above the array, is less than

0.50% of the area of the spacing between the detector elements, the array having been manufactured by a process which includes the following steps:

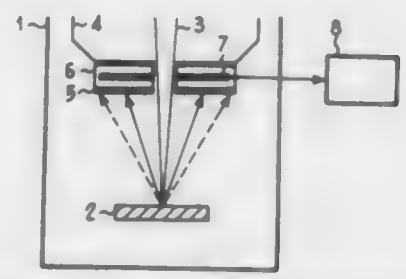
(i) depositing an array of detector elements upon the substrate in a configuration which is substantially identical to the configuration of (d), each detector element comprising a nickel-containing layer adjacent the substrate and gold-containing layer atop the nickel-containing layer;

(ii) removing the gold-containing layer so as to provide an array of detector elements comprised of the nickel-containing layer; and

(iii) removing metallic residue located in the spaces between the detector elements so that said residue has said cross-sectional area.

5,010,253

DETECTION SYSTEM FOR CATHODOLUMINESCENCE ANALYSIS



Marco Braglia, Turin; Roberto DeFranceschi, Vinovo, and Paolo Montangero, Turin, all of Italy, assignors to SIP - Societa Italiana per L-Esercizio Delle Telecomunicazioni P.A., Turin, Italy

Filed Dec. 4, 1989, Ser. No. 445,412

Claims priority, application Italy, Dec. 16, 1988, 68115 A/88

Int. Cl.[5] H01J *37/09*

U.S. Cl. 250—399 **7 Claims**

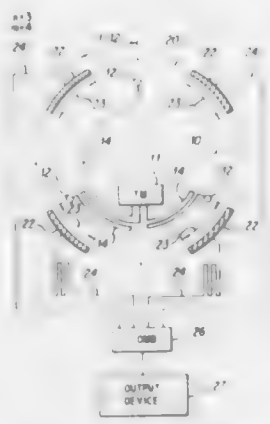
1. A detection system for material analysis by cathodoluminescence, comprising:

means for directing a beam of electrons onto a sample of a material to be analyzed whereby said sample generated photons characteristic of said material;

a detector positioned proximal to said sample for receiving photons generated by said sample; and

a photon-passing electron-blocking screen disposed between said sample and said detector to intercept electrons from said sample and prevent impingement of electrons from said sample on said detector, said screen being constituted of a plate of a glass selected from the group which consists of fluoride glasses, chalcogenide glasses and Ag-based glasses.

5,010,254



SYSTEM FOR COMMUNICATING ENERGY BETWEEN RELATIVELY MOVING DEVICES

John F. Moore, Libertyville, Ill., assignor to Kabushiki Kaisha Toshiba, Kanagawa, Japan

Filed Apr. 5, 1989, Ser. No. 333,249

Int. Cl.[5] G02B *27/00*

U.S. Cl. 250—551 **18 Claims**

1. A system for communicating energy from a first device to a second device, where the first and second devices are capable of movement relative to one other and include corresponding first and second parallel line segments which pass by one another upon the relative movement of the devices, comprising

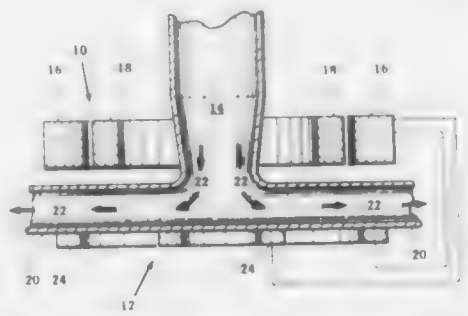
means for transmitting energy, including a plurality of transmitting elements mounted on the first device equidistant from one another along a first length of the first line segment; and

means for receiving energy from the transmitting means, including a plurality of receiving elements mounted on the second device equidistant from one another along a second length of the second line segment corresponding to the first length of the first line segment;

wherein the number of receiving elements is different than the number of transmitting elements, and

wherein the transmitting elements are point sources, and the receiving elements are extended receivers having a range of operation which is 1/(n-m) of the length of the second line segment, where n is the number of transmitting elements and m is the number of receiving elements, such that the range of operation between a transmitting element and a receiving element is sufficient to assure an operative relationship between at least one of the transmitting elements and one of the receiving elements upon the relative movement of the devices.

5,010,255



HIGH CURRENT MAGNETOHYDRODYNAMIC GIGAWATT PULSE GENERATOR

Mohamed A. Hilal, Madison, Wis., and Jerome F. Parmer, San Diego, Calif., assignors to General Dynamics Corporation, Convair Division, San Diego, Calif.

Filed Jan. 5, 1990, Ser. No. 461,510

Int. Cl.[5] H03K *3/38, 31/00*

U.S. Cl. 307—106 **4 Claims**

1. A high current MHD gigawatt pulse generator comprising.

a pulse power transformer having a superconducting primary winding and a normal secondary winding;

a gas high temperature channel extending through said pulse power transformer adjacent to said primary winding and beyond;

a magnetohydrodynamic disk generator having electrical current pickups positioned opposite said pulse power transformer attached to said channel whereby gas in said channel flows through magnetic flux created by said primary winding of said pulse power transformer and across said pickups of said magnetohydrodynamic generator, said pickups are electrically attached to said primary for storing current from said electrical current pickups therein;

means for initially storing current in said primary, and

means for supplying a gas flow through said channel.

5,010,256

GATE OUTPUT DRIVER USING SLEW-RATE CONTROL

Curtis J. Dicke, Colorado Springs, Colo., assignor to United Technologies Corporation, Hartford, Conn.

Filed Feb. 21, 1989, Ser. No. 313,193

Int. Cl.[5] H03K *5/08, 5/12, 6/04*

U.S. Cl. 307—263 **6 Claims**

1. A circuit for controlling the output of an integrated circuit to limit the rate of change of output current comprising:

an output inverter having a P-channel output transistor having a P-gate and being connected between a positive power supply terminal and an output node and an N-channel output transistor having an N-gate and being connected between said output node and a negative power supply terminal;

a first bias circuit connected to said P-gate and comprising a first P-channel bias transistor connected to said positive power supply terminal, a first N-channel bias transistor that is connected between said P-channel bias transistor and said first P-gate and a second N-channel bias transistor connected between said P-gate and said negative power supply terminal;

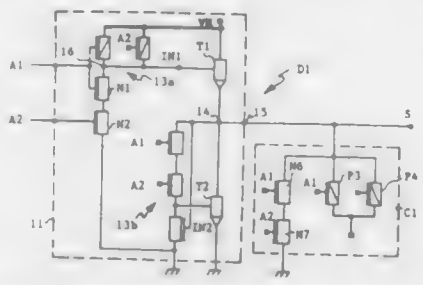
a second bias circuit connected to said N-gate and comprising a second P-channel bias transistor connected to said N-gate, a third N-channel bias transistor connected between said second P-channel bias transistor and said negative power supply terminal, and a third P-channel bias transistor connected between said N-gate and said positive power supply terminal, in which;

said output node is connected to a gate of said first P-channel bias transistor and to a gate of said third N-channel bias transistor; and

said first and second N-channel bias transistors, and said second and third P-channel bias transistors are all controlled by an input node that is also connected to said P-gate and said N-gate.

5,010,257

BICMOS LOGIC CIRCUIT WITH FULL SWING OPERATION



Gerard Boudon, Mennecy; Pierre Mollier, Boissise Le Roi; Jean-Paul Nuez, Savigny Sur Orge; Ieng Ong, Antony; Pascal Tannhof, Perthes, and Franck Wallart, Cesson, all of France, assignors to International Business Machines Corporation, Armonk, N.Y.

Filed Mar. 13, 1990, Ser. No. 493,014

Claims priority, application European Pat. Off., Mar. 14, 1989, 89480044.0

Int. Cl.[5] H03K *19/02, 19/094, 3/01*

U.S. Cl. 307—446 **13 Claims**

1. A BICMOS logic circuit biased between first and second supply voltages, comprising:

a CMOS logic circuit driven by a plurality of logic input signals;

a driving circuit connected to said CMOS logic circuit and including first and second bipolar transistors connected in series with an output node therebetween for providing an output signal on said output node; and

interface circuit means comprised of at least one pair of CMOS transistors connected to said first and second supply voltages for forcing said output signal to swing fully between said first and second supply voltages responsive to said logic input signals.

5,010,258

PROGRAMABLE LOGIC ARRAY USING ONE CONTROL CLOCK SIGNAL

Kimiyoshi Usami, Yokohama, and Aya Ishii, Tokyo, both of Japan, assignors to Kabushiki Kaisha Toshiba, Kawasaki, Japan

Filed Sep. 12, 1989, Ser. No. 406,099

Int. Cl.[5] H03R *19/096*

U.S. Cl. 307—469 **8 Claims**

1. A programable logic array, comprising:

an AND array and an OR array respectively composed of a plurality of second conductivity type MOS transistors;

a plurality of first conductivity type MOS transistors of a first group each having one terminal connected to an electrical power source for supplying a predetermined voltage; and

a plurality of first conductivity type MOS transistors of a second group each having one terminal connected to said electrical power source,

wherein a true single clock signal is supplied to gate terminals of said first conductivity type MOS transistors of said second group;

a complementary clock signal of said true single clock signal is supplied to gate terminals of said first conductivity type MOS transistors of said first group; and

wherein a ratio of gate width W and gate length L, i.e., W/L, of each of said first conductivity type MOS transistors of said second group is smaller than that of said first conductivity type MOS transistors of said first group

---

VOLTAGE BOOSTING CIRCUIT AND OPERATING METHOD THEREOF

Yoshinori Inoue; Masaki Kumanoya; Takahiro Komatsu; Yasuhiro Konishi, and Katsumi Dosaka, all of Hyogo, Japan, assignors to Mitsubishi Denki Kabushiki Kaisha, Tokyo, Japan

Filed Dec. 21, 1989, Ser. No. 454,580

Claims priority, application Japan, Dec. 28, 1988, 63-332238

Int. Cl.[5] H03K *4/58, 19/017, 17/04, 19/094*

U.S. Cl. 307—482 **12 Claims**

1. A voltage boosting circuit provided in a semiconductor integrated circuit device for generating at an output terminal an output signal boosted to be higher than a supply voltage, comprising:

charging means provided between a power supply and a prescribed node in said voltage boosting circuit for being conductive when the potential of said node is lower than a given value, thereby charging said prescribed node, and being nonconductive when the potential of said prescribed node is higher than a given value, thereby preventing charge from flowing back to the power supply from said prescribed node,

signal inverting means responsive to an input signal for providing said output signal inverted from said input signal to an output terminal thereof based on the potential of said prescribed node and a ground potential,

delay means coupled between said output terminal and said

prescribed node for delaying said output signal by a given time, and

capacitor means responsive to the output of said delay means for boosting the potential of said prescribed node and consequently boosting said output signal.

5,010,260

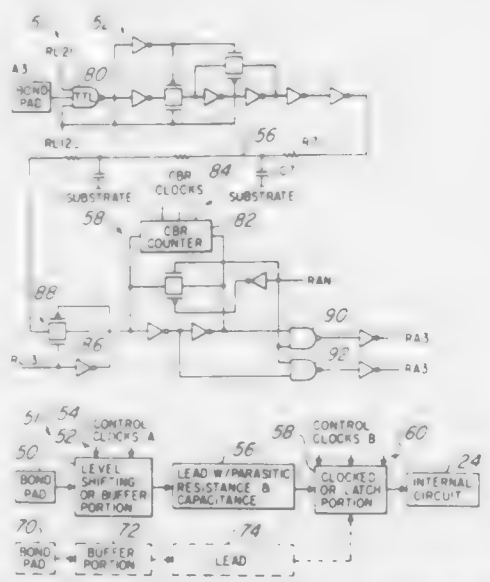
INTEGRATED CIRCUIT FURNISHING A SEGMENTED INPUT CIRCUIT

Roger D. Norwood, Sugarland, and David V. Kersh, III, Houston, both of Tex., assignors to Texas Instruments Incorporated, Dallas, Tex.

Continuation of Ser. No. 455,870, Dec. 19, 1989, abandoned, which is a continuation of Ser. No. 265,069, Oct. 31, 1988, abandoned. This application Jun. 11, 1990, Ser. No. 537,207

Int. Cl.[5] **H03K** *17/08, 17/16, 19/003, 19/092*

U.S. Cl. 307—482.1 **16 Claims**



1. An integrated circuit furnishing a segmented input circuit, comprising:

A. a substrate of semiconductor material;

B. plural bonding pads carried upon said substrate at the margin of said substrate, at least some of said bonding pads receiving signals from external of said substrated;

C. an internal circuit formed on said substrate and receiving at least one of said signals received at one of said bonding pads, said one bonding pad being spaced from said internal circuit a distance that otherwise includes sufficient parasitic capacitance and resistance to distort said at least one signal; and

D. an input circuit formed on said substrate and connecting said one bonding pad to said internal circuit to carry said at least one signal from said bonding pad to said internal circuit, said input circuit including a level shifing portion located adjacent said bonding pad that changes said signal from external of said substrate to voltage levels used in

said internal circuit, a lead subject to parasitic resistance and capacitance extending from said level shifting portion and carrying said level shifted signal, and a clocked portion located adjacent said internal circuit and connected to said lead to pass said signal from said lead to said internal circuit in conjunction with control clocks extending to said clocked portion.

5,010,261

LOSSLESS GATE DRIVER CIRCUIT FOR A HIGH FREQUENCY CONVERTER

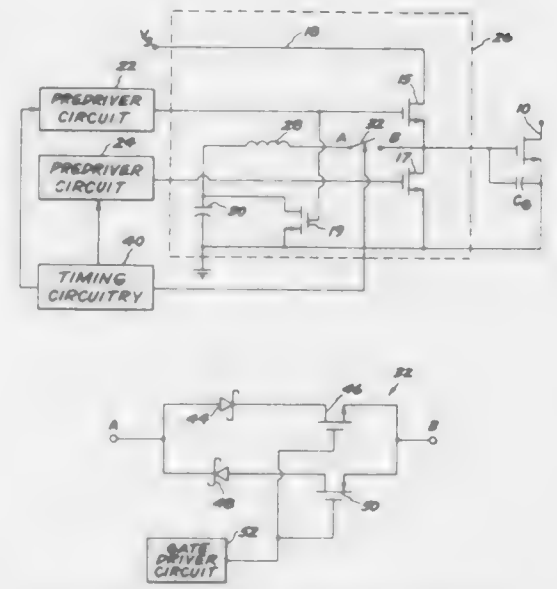
Robert L. Steigerwald, Burnt Hills, N.Y., assignor to General Electric Company, Schenectady, N.Y.

Filed Dec. 8, 1989, Ser. No. 447,947

Int. Cl.[5] **H03K** *17/687, 19/017*

U.S. Cl. 307—571 **15 Claims**

1. An efficient gate driver circuit for driving a semiconductor power switching device of a high-frequency power converter, said power switching device having an input capacitance, comprising:



first and second switch means for coupling to a gate drive power supply and connected in series in a half-bridge configuration with a junction therebetween, the gate of said power switching device being coupled to said junction,

ac switch means having two terminals, one of said terminals being coupled to said first and second switch means at said junction therebetween;

resonant circuit means coupled to the other one of said terminals of said ac switch means for resonantly charging and discharging said input capacitance so as to result in substantially lossless gate driver switching, said ac switch means being operable to couple said series resonant circuit to said power switching device during the resonant charging and discharging of said input capacitance;

said first switch means ensuring that said input capacitance is fully charged and said power switching device remains on before said ac switch means is activated in order to discharge said input capacitance; and

said second switch means ensuring that said input capacitance is fully discharged and said power switching device

remains off before said ac switch means is activated in order to charge said input capacitance.

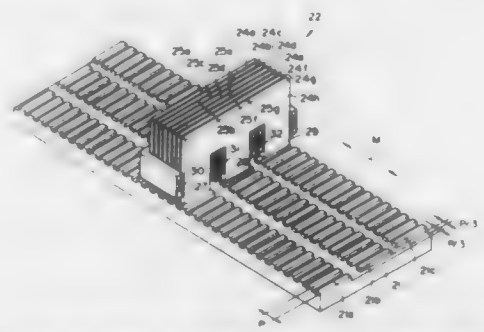
STRONG MAGNETIC THRUST FORCE TYPE ACTUATOR



Hiroshi Nakagawa, and Minoru Maeda, both of Mie, Japan, assignors to Shinko Electric Company Ltd., Tokyo, Japan

Filed Jul. 18, 1989, Ser. No. 381,351

Claims priority, application Japan, Jul. 20, 1988, 63-180497; Nov. 8, 1988, 63-282021; Nov. 8, 1988, 63-282022; Nov. 14, 1988, 63-287033

Int. Cl.[5] **H02K** *41/00*

U.S. Cl. 310—12 **17 Claims**

1. A strong magnetic thrust force type actuator comprising:

a primary magnetic member supported by a support means moving along a predetermined direction, the primary magnetic member generating a magnetic field in a direction transverse to the predetermined direction through magnetic poles thereof; and

a secondary magnetic member having a plurality of facing portions facing the primary magnetic member, in which the facing portions are disposed at an equal pitch in the predetermined direction, thus moving the primary magnetic member relative to the secondary magnetic member when a magnetic field acts upon the facing portions formed with the secondary magnetic member, the improvement wherein

the primary magnetic member comprises:

a core having a plurality of plate members separated by first equal pitches in the predetermined direction, in which the plate members have facing portions which extend in a direction transverse to the predetermined direction;

a plurality of permanent magnet, inserted between side surfaces of the plate members in a direction perpendicular to the facing portions so that adjacent permanent magnets are of an opposite polarity; and

an insulated wire wound around the cores so as to form magnetic poles, wherein

the secondary magnetic member comprises:

the facing portions facing the facing portions formed with the primary magnetic member, the facing portions disposed at a second equal pitch in the predetermined direction, the second equal pitch of the facing portion formed with the secondary magnetic member approximately twice as large as the first equal pitch of the facing portion formed with the primary magnetic member,

whereby when the insulated wire is energized facing portions of the primary magnetic member which are disposed toward the facing portions formed with the secondary magnetic member contribute to produce a magnetic thrust for moving the primary magnetic member relative to the secondary magnetic member.

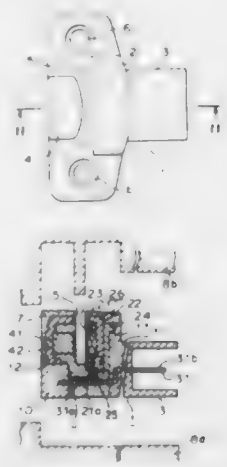
HALL EFFECT TYPE SENSING DEVICE



Shigemi Murata, Himeji, Japan, assignor to Mitsubishi Denki Kabushiki Kaisha, Tokyo, Japan

Filed Feb. 14, 1990, Ser. No. 479,921

Claims priority, application Japan, Feb. 21, 1989, 1-39455; Feb. 23, 1989, 1-41884

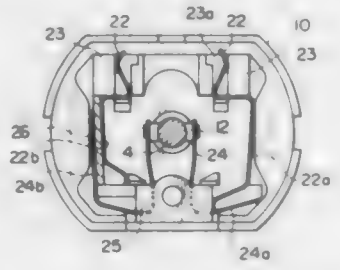
Int. Cl.[5] **F01B** *7/14*

U.S. Cl. 310—68 B **3 Claims**

1. A Hall effect type sensing device, comprising:

magnetic circuit forming means including a permanent magnet;

a Hall transducing element arranged in a magnetic circuit formed by the magnetic circuit forming means;



a frame body having a holding part for locating and holding the magnetic circuit forming means and the Hall transducing element in predetermined positions, the frame body being prepared by primary molding; and

a protective compound encapsulating the magnetic circuit forming means, the permanent magnet, and the Hall transducing element together with the frame body to prevent any relative movement therebetween, the protective compound being prepared by secondary molding and defining a gap in the magnetic circuit forming means, a movable shutter, and said gap adapted to accommodate said movable shutter.

MINIATURE MOTOR HAVING POSITIVE-COEFFICIENT THERMISTOR

Shinjiro Yamada; Seiki Satoh, both of Utsunomiya; Kazuichi Mabuchi, Matsudo; Shiei Kitao, Matsudo, and Yoshiaki Egawa, Matsudo, all of Japan, assignors to Mabuchi Motor Co., Ltd., Chiba and Mitsui Mining & Smelting Co., Tokyo, both of, Japan

Filed Sep. 1, 1989, Ser. No. 402,499
Claims priority, application Japan, Sep. 9, 1988, 63-118363[U]; Dec. 14, 1988, 63-162101[U]
Int. Cl.[5] H02K *11/00*; H01C *7/02*; H02H *5/04*
U.S. Cl. 310—72 9 Claims

1. A miniature motor having a positive-coefficient thermistor comprising a stator having a permanent magnet as a field, a rotor formed by winding a plurality of rotor windings on a rotor core; current being fed to said rotor windings via a commutator making sliding contact with brushes supported by a motor cover plate, making contact with a commutator, and a positive co-efficient thermistor for controlling current to said rotor windings, in which said motor cover plate has a pair of terminal holders for holding terminals;

said terminals including a pair of terminals made of an electrically conductive material and having engaging and locking portions for engaging with said terminal holders;

said brushes including a pair of brush arms made of an electrically conductive material,

connecting members disposed in such a manner as to come in resilient contact with any one of said brush arms and one of said terminals to ensure an electrical connection between said brush arms and said terminals,

a first supporting member disposed in such a manner as to come in resilient contact with one of said brush arms to electrically connect to said brush arms; and ,

a second supporting member disposed in such a manner as to come in resilient contact with the other one of said terminals are provided in said motor cover plate; said positive-coefficient thermistor being held between said first and second supporting members.

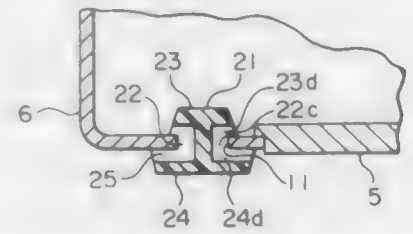
MOISTURE DRAIN BUSH FOR AN ENGINE STARTER MOTOR

Takao Tanaka, and Kazuhiro Odahara, both of Himeji, Japan, assignors to Mitsubishi Denki Kabushiki Kaisha, Tokyo, Japan



Filed Feb. 9, 1990, Ser. No. 477,376
Claims priority, application Japan, Feb. 10, 1989, 1-32123
Int. Cl.[5] H02K *5/10*
U.S. Cl. 310—88 5 Claims

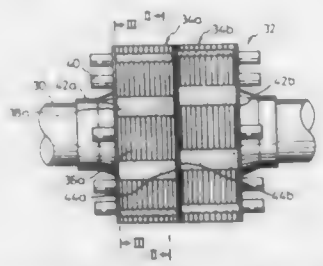
1. A moisture drain bush adapted to be inserted into and held by a moisture drain hole defined in a housing wall of an engine starter motor, comprising:

a stem having a first and a second end, said stem having an axial length substantially equal to a thickness of said housing wall and having an axial groove extending between said first and second ends of said stem;

a first flange having a substantially flat inner surface radially extending from said first end of said stem, said inner surface having a diameter larger than the diameter of said drain hole and having a first radial groove connected to one end of said axial groove in said stem and radially extending to the outer periphery of said first flange; and

a second flange having a substantially flat inner surface radially extending from said second end of said stem, said inner surface having a diameter larger than the diameter of said drain hole and having a second radial groove

connected to the other end of said axial groove in said stem and radially extending to the outer periphery of said second flange;



whereby, when said drain bush is inserted within said drain hole in said motor housing, said axial groove and said first and second radial grooves as well as said drain hole together defining a continuous but bent moisture drain path

ELECTRICAL MULTI-POLE MACHINE

Reinder H. Dijken, Groningen, Netherlands, assignor to U.S. Philips Corporation, New York, N.Y.

Filed May 31, 1989, Ser. No. 359,468
Claims priority, application Netherlands, Jun. 27, 1988, 8801628
Int. Cl.[5] H02K *1/12, 21/26, 1/00*
U.S. Cl. 310—254 4 Claims

1. An electrical multi-pole machine of the electromagnetic type, the machine comprising:

a first machine section which comprises a soft-magnetic first body provided with permanent magnets having pole faces disposed along a first circularly cylindrical surface, said pole faces extending both axially and tangentially,

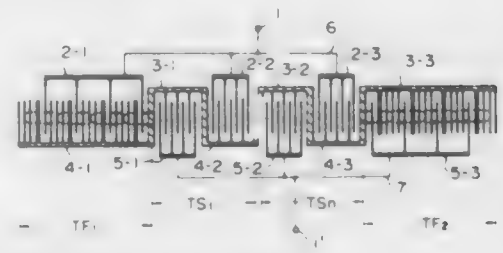
a second machine section which is coaxial with the first machine section and which comprises a second body provided with soft-magnetic teeth having regularly spaced tooth surfaces which are disposed along a second circularly cylindrical surface and which cooperate with the pole faces via an air gap, said tooth surfaces also extending both axially and tangentially,

at least three active coils each having two opposite coil sides, and

a machine shaft about which said machine sections are rotatable relative to each other, characterized in that

the soft-magnetic first body is a cylindrical outer body on whose inner side the radially magnetized magnets are arranged,

the first machine section is constructed as the stator and the second machine section is constructed as the rotor, and the pole faces, viewed in the circumferential direction of said first cylindrical surface, are arranged in groups, at least three groups of magnets being distinguished, the number of groups of magnets being equal to the number of active coils, which groups are separated from one another by coils slots in which the coil sides of the active coils are accommodated, adjacent pole faces along said first circularly cylindrical surface in each of said groups having opposite polarities,



a tangential dimension of the axially and tangentially extending tooth surfaces is smaller than or equal to a corresponding tangential dimension of the pole faces, and

two of said coil sides of the active coils are accommodated in each of the coil slots which extend at least substantially parallel to the machine shaft, said coil sides of each individual active coil each being accommodated in one of the coil slots at opposite sides of one of the groups of magnets and being interconnected by coil end portions.

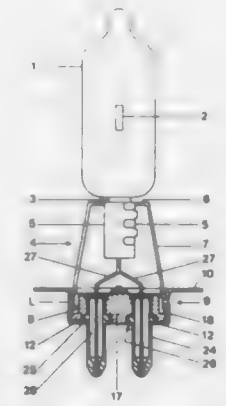
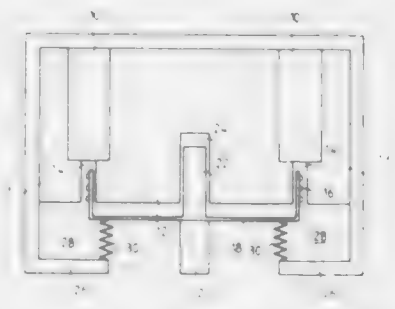
SAW DEVICE
James A. Greer, Andover, Mass., assignor to Raytheon Company, Lexington, Mass.
Continuation of Ser. No. 293,607, Jan. 5, 1989, abandoned, which is a continuation of Ser. No. 153,186, Mar. 8, 1988, abandoned, which is a continuation of Ser. No. 944,911, Dec. 22, 1986, abandoned. This application Nov. 28, 1989, Ser. No. 442,404
Int. Cl.[5] H01L *41/08*
U.S. Cl. 310—313 B 29 Claims



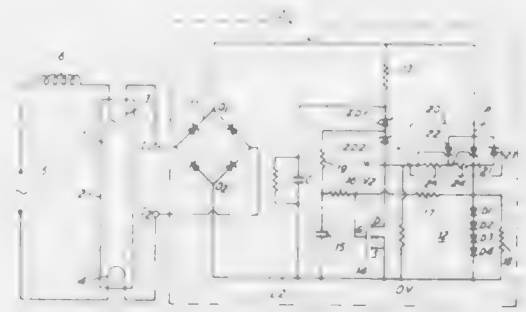
1. A surface acoustic wave device comprising:
a base having a surface for supporting surface wave propagation, including at least a transducer coupled to said surface wave propagation surface;
a cover disposed over said base enclosing said surface wave propagating surface, said cover comprised of a material which is optically transparent to electromagnetic energy generally in the wavelength range of about 0.185 μm to 4 μm;
a first layer comprised of a metal oxide and disposed between said cover and base; and
a second layer comprised of a metal oxide and disposed on said surface wave propagation surface with a first one of said first and second layers having a recess and with a second, different one of said first and second layers disposed in alignment with said recess and having dimensions comparable to those of said recess.

5,010,271
COLOR PICTURE TUBE HAVING AN ELECTRON GUN WITH REDUCED CONVERGENCE DRIFT
Loren L. Maninger, and Bruce G. Marks, both of Lancaster, Pa., assignors to RCA Licensing Corporation, Princeton, N.J.
Filed Oct. 24, 1989, Ser. No. 427,230
Int. Cl.[5] H01J *29/50, 29/51*
U.S. Cl. 313—412 10 Claims



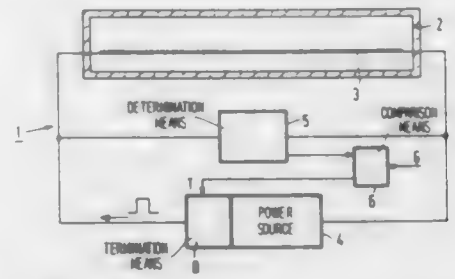
1. In a color picture tube including a screen and an inline electron gun for generating and directing three inline electron beams along separate paths toward said screen, said electron gun comprising a plurality of cathodes and at least six electrodes longitudinally spaced from said cathodes, the improvement comprising
the first, second and fourth electrodes from said cathodes being of materials having lower coefficients of thermal expansion than the coefficients of thermal expansion of the materials of the other electrodes.

5,010,272
CEMENTLESS ELECTRIC LAMP - BASE COMBINATION
Fritz Eckhardt, Gerstetten; Peter Helbig, Sontheim, and Walter Schoenherr, Giengen, all of Fed. Rep. of Germany, assignors to Patent Treuhand Gesellschaft für elektrische Gluhlampen mbH, Munich, Fed. Rep. of Germany
Filed Feb. 20, 1990, Ser. No. 482,289
Claims priority, application Fed. Rep. of Germany, Feb. 24, 1989, 8902247[U], Jun. 9, 1989, 8907108[U]
Int. Cl.[5] H01K *1/46*
U.S. Cl. 313—579 21 Claims



1. A cementless electric lamp (1, 31) and base combination in which the lamp comprises a single-ended bulb (1, 31) having a press seal (3, 33) at one end thereof, filaments (2, 32) located within the bulb, and current connection leads (27, 51) extending outwardly of the press seal; and
the base comprises
a metallic base sleeve (9, 40), a base core (17, 48) of insulating material, and terminal contact elements (24, 24', 56) electrically connected to said current connection leads (27, 51), and
means (4, 7, 38) coupled to the bulb and secured to the base sleeve for attaching the bulb to the base sleeve,
wherein
the base sleeve (9, 40) is a hollow essentially cylindrical structure;
the base core (17, 48) is an apertured, essentially cylindrical solid structure dimensioned and shaped to fit into said hollow base sleeve, and defining an end surface (16', 47) remote from the lamp;
a rim (12, 15', 50) formed on one of said structures and in engagement with an end portion of the other of said structures; and
projecting tabs (13, 13', 45) formed on said sleeve and bent by about 90° and extending at least in part transversely to the longitudinal axis (CL) of the lamp and over part of the end surface (16', 47); and
wherein said rim and said projecting tabs are, respectively, positioned to lock the base core into the base sleeve and hence lock the base core and the base sleeve together without play.

5,010,273
AGILE MAGNETRON WITH TUNING MOTOR WITH IMPROVED COOLING
Alain Vermersch, Velizy, France, assignor to Thomson-CSF, Puteaux, France
Filed Jul. 7, 1989, Ser. No. 377,092
Claims priority, application France, Jul. 8, 1988, 88 09308
Int. Cl.[5] H01J *25/50*
U.S. Cl. 315—39.61 6 Claims

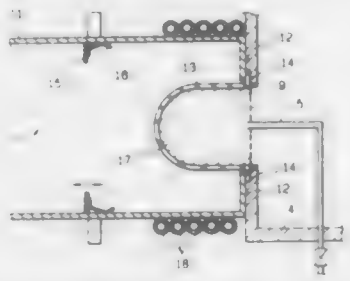


1. A frequency tuning motor for an agile magnetron, said motor having a coil that moves in a very narrow gap facing a pole piece wherein, in order to improve the cooling of the motor, the space between the coil and the pole piece is filled with a gas having high thermal conductivity.

5,010,274
STARTER CIRCUITS FOR DISCHARGE LAMPS
Geoffrey J. Phillips, Gilesgate, and Kevin F. George, Merstham, both of England, assignors to Thorn EMI plc, London, England
Filed Mar. 16, 1989, Ser. No. 324,510
Claims priority, application United Kingdom, Mar. 17, 1988, 8806384
Int. Cl.[5] H05B *41/36*
U.S. Cl. 315—101 12 Claims

1. A starter circuit suitable for a discharge lamp which is connected to an alternating voltage supply by means of a reactive ballast, the starter circuit comprising a rectifier for connecting the lamp to first and second voltage supply lines; at least one diode; a current control circuit having a controlled current path connected in series with said at least one diode between the voltage supply lines, the current control circuit being arranged to control flow of current in said controlled current path in dependence on a first control voltage applied at a control terminal of the current control circuit, whereby, in operation, the controlled current path can be triggered into a non-conducting state to present a relatively high impedance, preventing a flow of current in said path, and can be triggered into a conducting state to present a relatively low impedance allowing a flow of current in said path; means for deriving from the rectified supply a predetermined said control voltage to trigger said current control circuit into said conducting state and a field effect transistor arranged to modify said predetermined control voltage in dependence on a further control voltage applied to the gate electrode of said field effect transistor, to trigger said current control circuit into said non-conducting state and cause a high voltage striking pulse to be applied across the lamp, said further control voltage being dependent on a voltage at a junction between said at least one diode and said controlled current path, whereby the starting circuit, in operation, triggers said controlled current path into its conducting an non-conducting state a plurality of times during a half cycle of applied alternating voltage to provide a succession of said high voltage striking pulses across said discharge lamp during a single half cycle of the rectified supply thereby assisting the starting of said lamp.

5,010,275
ELECTRON TUBE DEVICE AND ELECTRON TUBE
Ronald van der Wilk, Eindhoven, Netherlands, assignor to U.S. Philips Corporation, New York, N.Y.
Filed Apr. 13, 1989, Ser. No. 337,241
Claims priority, application Netherlands, Apr. 20, 1988, 8801016
Int. Cl.[5] H05B *41/36*
U.S. Cl. 315—106 7 Claims



1. In an electron display tube apparatus including an envelope containing a line cathode and including an electric power source for repetitively supplying power pulses to the line cathode, the improvement comprising means for controlling the line cathode temperature, said means including:
a. termination means electrically connected to the power source and having an input for receiving a control signal, said termination means effecting termination of each of the power pulses when the control signal is applied to the input;
b. determination means coupled to the line cathode for directly determining the temperature of said cathode and for producing a value representative of said temperature;
c. comparison means electrically connected to the determination means and to the input of the termination means, said comparison means producing said control signal when the value representative of the line cathode temperature reaches a predetermined magnitude, thereby effecting termination of the pulse instantaneously being supplied to the line cathode.

5,010,276
MICROWAVE PLASMA CVD APPARATUS WITH PLASMA GENERATING CHAMBER CONSTITUTING A CYLINDRICAL CAVITY RESONATOR
Hiroshi Echizen, Tokyo, and Satoshi Takaki, Yokohama, both of Japan, assignors to Canon Kabushiki Kaisha, Tokyo, Japan
Filed Oct. 3, 1988, Ser. No. 252,646
Claims priority, application Japan, Oct. 9, 1987, 62-256030; Oct. 9, 1987, 62-256031
Int. Cl.[5] H01J *7/24*
U.S. Cl. 315—111.21 8 Claims

1. In a microwave plasma CVD apparatus comprising a treating chamber having means for supporting a body to be treated therein, a plasma generating chamber connected to the treating chamber through a metal mesh, means for introducing a gas into the plasma generating chamber, and means for introducing microwave to convert the gas in the plasma generating

chamber into a plasma, the improvement comprising (a) means for maintaining the microwaves in continuous oscillation, (b) the plasma generating chamber constituteing a cylindrical cavity resonator defined by the metal mesh and a stop or stops, and (c) a bell-jar (i) smaller than the cavity in the axial length and (ii) smaller than the inside diameter of said cavity being disposed in the cylindrical cavity resonator in contact with the

metal mesh, thereby constituting a reentrant cylindrical cavity resonator through generation of electric discharge in the bell-jar,

the single stop is disposed slidably along the cylindrical cavity or, alternatively, a plurality of the stops are disposed, the aperture of the stop is circular, 5-vane or polygonal, and the open area ratio of the aperture is variable

ELECTRONIC SWITCHING BALLAST FOR A FLUORESCENT LAMP

Sung H. Kang, Jinjoen-Meon, Rep. of Korea, assignor to Sung Ho Korea Company, Seoul, Rep. of Korea

Filed Jun. 14, 1989, Ser. No. 365,865
Int. Cl.[5] H05B *37/02*
U.S. Cl. 315—224 **4 Claims**

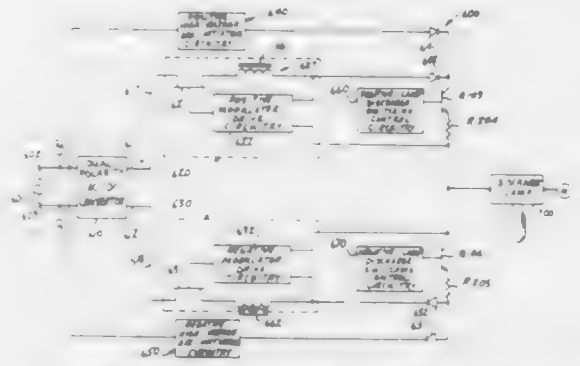
1. An electronic switching ballast for fluorescent lamps, comprising:

rectifying circuit means for rectifying an alternating current input signal provided to the input of said ballast to a direct current signal;

square wave generator means, coupled to the rectifying circuit means, for providing a square wave signal in response to said direct current signal;

phase discriminator means, coupled to the rectifying circuit means, for comparing a feedback signal with a reference voltage in response to said direct current signal to provide a full-wave rectified signal;

switching time differentiating circuit means, coupled to the square wave generator and phase discriminator means, for combining said square wave signal and said full-wave rectified signal, and for providing a pair of pulsed signals in reference to said combined signals, said pair of pulsed signals being out of phase with respect to one another; and



wave-shaping circuit means, coupled to the switching time differentiating circuit means, for providing a sinusoidal output signal in reference to said pair of pulsed signals to an external circuit, the output of said wave-shaping circuit means being coupled to the input of said phase discriminator means to feed back at least portion of said sinusoidal output signal to the phase discriminator means.

SWITCHED CAPACITIVE BALLASTS FOR DISCHARGE LAMPS

Michael S. Lathom, 4314 Forest Lakes Dr., Del Valle, Tex. 78617; Bruce B. Gullixson, 1513 W. Jackson, and Bruce P. Sweat, 3015 E. 16th, both of, Spokane, Wash. 99205

Continuation-in-part of Ser. No. 769,482, Aug. 26, 1985, Pat. No. 4,808,886. This application Mar. 11, 1988, Ser. No. 167,255
Int. Cl.[5] H05B *37/00, 39/00/41/14*
U.S. Cl. 315—227 R **103 Claims**

1 A ballast circuit for controlling electrical current flow through an electrical discharge lamp from an electricity source providing alternating electrical current having positive potential portions and negative potential portions, comprising:

positive electrical charge storage means connected to receive current from said electricity source during said positive potential portions;

negative electrical charge storage means connected to receive current from said electricity source during said negative potential portions;

at least one positive current modulator for controllably modulating current discharged from the positive electrical charge storage means for powering the discharge lamp;

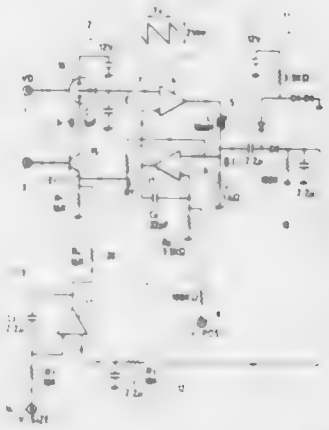
at least one negative current modulator for controllably modulating current discharged from the negative electrical charge storage means for powering the discharge lamp;

wherein at least one of said current modulators comprises a current flow rate control means connected to controllably conduct current from a charge storage means to power said discharge lamp; and modulation control means for controlling said current flow rate control means; said current flow rate control means being a current gate controlled by the modulation control means to conduct pulses of electrical current from the charge storage means;

at least one positive current switching means connected to receive positive current from said positive electrical charge storage means and control positive current flow through said discharge lamp to define positive lamp discharge periods;

at least one negative current switching means connected to receive negative current from said negative electrical charge storage means and control negative current flow through said discharge lamp to define negative lamp discharge periods;

switching control means for controlling said positive and negative switching means so that positive lamp discharge periods do not occur simultaneously with negative lamp discharge periods;



wherein said pulses are provided at a modulation frequency which is at least 10 times more frequent than a lamp frequency at which the discharge lamp operates.

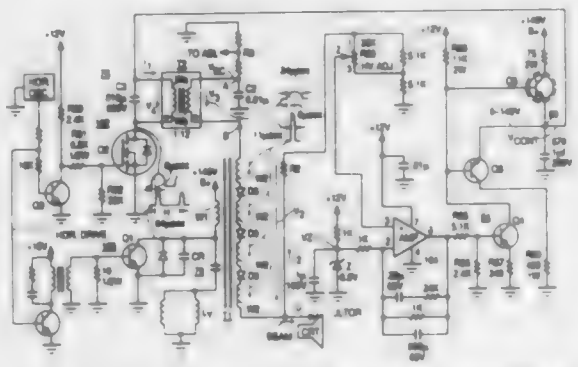
HIGH VOLTAGE STABILIZATION CIRCUIT FOR VIDEO DISPLAY APPARATUS

Enrique Rodriguez-Cavazos, Indianapolis, Ind., assignor to RCA Licensing Corporation, Princeton, N.J.

Filed Apr. 30, 1990, Ser. No. 516,487
Int. Cl.[5] H01J *29/70;* **H04N** *5/63*
U.S. Cl. 315—411 **13 Claims**

1. A high voltage power supply of a video apparatus, comprising:

a source of an input signal at a frequency that is related to a deflection frequency;



a first flyback resonant circuit that includes a deflection winding;

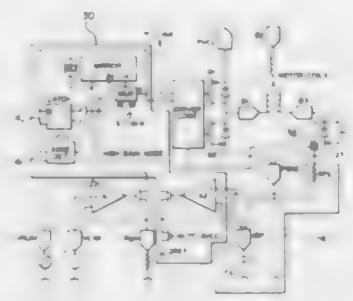
first switching means responsive to said input signal and coupled to said first flyback resonant circuit for generating a resonant first flyback pulse voltage at a frequency that is related to a deflection frequency that is developed across a high voltage winding of a flyback transformer;

a second flyback resonant circuit;

second switching means responsive to said input signal and

coupled to said second flyback resonant circuit for generating a resonant second flyback pulse voltage at a frequency that is related to said deflection frequency having a controllable amplitude, said second flyback pulse voltage being applied in series with said first flyback voltage to produce a high voltage pulse that is coupled to an electrode of a cathode ray tube having an amplitude that

is in accordance with a sum of said first and second flyback pulse voltages, such that a leading edge of a given pulse of said second flyback voltage occurs prior to a leading edge of said first flyback pulse voltage; and



a control circuit for varying said amplitude of said second flyback pulse voltage in a manner that varies said amplitude of said high voltage pulse.

METHOD AND APPARATUS FOR DRIVING A DC MOTOR

Gregory O. Moberg, Rochester, N.Y., assignor to Eastman Kodak Company, Rochester, N.Y.

Filed May 11, 1989, Ser. No. 350,870
Int. Cl.[5] H02P *6/02*
U.S. Cl. 318—254 **12 Claims**

1. A control circuit for a DC motor, said control circuit comprising:

a. driver means for applying a phase current to coils of a DC motor in accordance with a commutation sequence, said driver means including a plurality of FET current sink transistors, each transistors, each current sink transistor corresponding to one of said coils of said DC motor;

b. sensing means for sensing a drain-to-source voltage of one of said current sink transistors when an ON gate voltage is applied thereto by said driver means and applying said drain-to-source voltage across a drain and source of an FET reference transistor;

c. means for supplying said ON gate voltage to a gate of said FET reference transistor thereby inducing a reference current to flow through said FET reference transistor that is proportional to a current flowing through said current sink transistor that has said ON gate voltage applied thereto; and

d. means for generating a feedback current based on said reference current that is proportional to the drain-to-source voltage sensed by said sensing means and inversely proportional to a drain-to-source resistance of said FET reference transistor;

e. comparing means for comparing said feedback current to a secondary reference current and controlling an operating current level of said DC motor in response thereto

MOTOR CONTROL CIRCUIT

Kimio Kitajima, and Hiroyuki Kiuchi, both of Komagane, Japan, assignors to Sankyo Seiki Mfg. Co., Ltd., Tokyo, Japan

Filed Jan. 12, 1990, Ser. No. 464,354
Claims priority, application Japan, Jan. 13, 1988, 1-6471
Int. Cl.[5] H02P *3/10*
U.S. Cl. 318—373 **12 Claims**

3. A motor control circuit for causing a motor to have a reduce stopping time comprising:

means for supplying n rotational signals whose relative phase differences are proportional to the rotational speed of a motor and are nominally related by 360°/n;

means for forming inverted signals from n-1 of said rotational signals;

a motor drive circuit;

means for supplying a signal to stop the motor;

rotational direction instruction means for controlling said motor drive circuit so that said motor is reversely rotated when said signal to stop said motor is supplied;

means for discriminating the direction of said motor and for determining, from said n signals and from said n-1 inverted signals, a predetermined initial flange of said n signals and n-1 inverted signals following a reversal of said motor and for supplying a signal to said motor drive circuit to de-energize said motor upon determining said initial change; and

means for holding said motor in a stopped condition following stopping of said motor.

8. A method for reducing the time for a motor to come to a complete stop comprising:

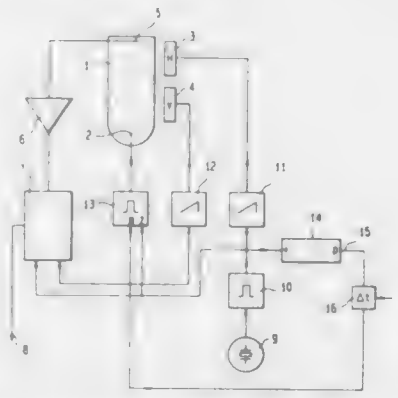
supplying a plurality of n rotational signals related to the rotational speed of a motor by the relative phase difference therebetween, the signals nominally being related by 360°/n;

forming n-1 inverted signals from said n rotational signals;

reversing the rotational direction of said motor in response to a signal to stop the motor;

determining, from said n signals and n-1 inverted signals, a predetermined initial change of any of said n rotational signals and n-1 inverted signals following a reversal of said motor;

de-energizing said motor upon determining said initial change; and



positively holding the motor in a stopped state after said motor has come to a complete stop.

DEVICE FOR THE OPTICAL RECORDING OF RAPID PROCESSES WITH A TV CAMERA

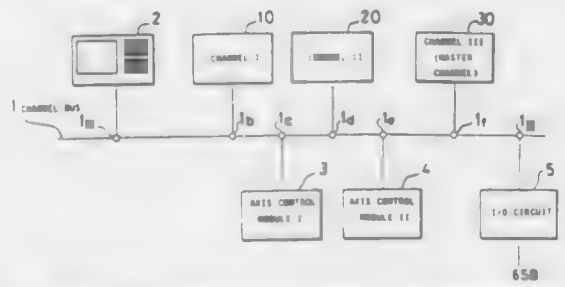
Wilhelm Heinz, Linkenheim, Fed. Rep. of Germany, assignor to European Atomic Energy Community, Luxembourg

Filed Nov. 17, 1989, Ser. No. 437,565
Claims priority, application Luxembourg, Nov. 18, 1988, 87392
Int. Cl.[5] G09G *1/04*; H01J *29/52*
U.S. Cl. 315—384 **6 Claims**

1. A device for the optical recording of rapid processes with at least one TV camera, which comprises means for deviating and suppressing a scanning beam, in order to make the scanning beam run successively and cyclically over N lines of a picture plane on which the processes are projected, line pulses being produced during scanning of said N lines, the device further comprising:

cyclic line counter means for carrying out one counting step for each of said line pulses and providing an end-of-count pulse after p line pulses, N/p being an integer $>>1$,

the TV camera having a beam suppression circuit with the end-of-count pulse being applied thereto for suppressing the scanning beam;



and a sawtooth generator, synchronized with the end-of-count pulse of the counter means, for controlling the vertical deviation of the scanning beam.

5,010,285

NUMERICAL CONTROL SYSTEM

Hideaki Kawamura, Hachioji; Kentaro Fujibayashi, Musashino, and Yosato Hitaka, Tokyo, all of Japan, assignors to Fanuc Ltd., Minamitsuru, Japan

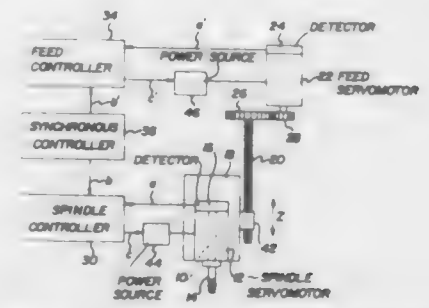
PCT No. PCT/JP89/00225, § 371 Date Oct. 17, 1989, § 102(e) Date Oct. 17, 1989, PCT Pub. No. WO89/08876, PCT Pub. Date Sep. 21, 1989
PCT Filed Mar. 2, 1989, Ser. No. 425,175
Claims priority, application Japan, Mar. 9, 1988, 63-55761
Int. Cl.[5] G05B *19/18*
U.S. Cl. 318—569 **3 Claims**

1 A numerical control system for controlling a plurality of axes with a plurality of channels, comprising:

means for receiving machining programs;

means for receiving a single block signal;

means for interrupting a machining program of a first channel in response to said single block signal being received; and



single block control means for controlling the channels so that when the machining program for the first channel is interrupted, machining programs for other channels are suspended.

METHOD OF SYNCHRONOUS CONTROL OF SPINDLE MOTOR AND FEED MOTOR

Kosei Nakamura; Shinichi Kono; Kazuhisa Numai, and Masami Kimijima, all of Yamanashi, Japan, assignors to Fanuc Ltd., Yamanashi, Japan

PCT No. PCT/JP88/00907, § 371 Date May 8, 1989, § 102(e) Date May 8, 1989, PCT Pub. No. WO89/02618, PCT Pub. Date Mar. 23, 1989
PCT Filed Sep. 9, 1988, Ser. No. 365,158
Claims priority, application Japan, Sep. 14, 1987, 62-228514
Int. Cl.[5] G05B *19/18*
U.S. Cl. 318—571 **2 Claims**

1. A method of control of a spindle servomotor during machining, with a feed servomotor movably connected to the spindle servomotor such that the feed servomotor translationally moves the spindle servomotor along a longitudinal axis of the spindle servomotor, wherein the spindle servomotor has a torque limit versus rotational speed function curve represented by a straight line over a first speed range and a hyperbola over a second speed range, said method comprising the step of:

(a) detecting a rotational speed of the spindle servomotor;

(b) moving the spindle servomotor along a longitudinal axis with a translational speed determined by a speed of the feed servomotor; and

(c) controlling the speed of the spindle servomotor in response to said torque limit function curve such that the spindle servomotor is accelerated over said first speed range along a straight line to have a constant torque and over said second speed range along a hyperbola line to have a decreasing torque so as to maintain a maximum torque of said spindle servomotor as said spindle is moved longitudinally.

5,010,287

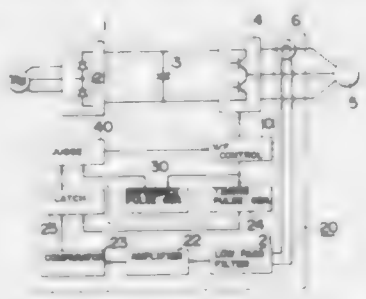
INDUCTION MOTOR CONTROL SYSTEM

Tadayoshi Mukai, Izumi-Otsu, and Akira Yoshino, Seto, both of Japan, assignors to Matsushita Electric Works, Ltd., Osaka, Japan

Filed Feb. 22, 1989, Ser. No. 313,461
Claims priority, application Japan, Feb. 24, 1988, 63-40997
Int. Cl.[5] H02P *5/34*
U.S. Cl. 318—801 **8 Claims**

1. An induction motor control system comprising:

an inverter for supplying a variable frequency AC voltage to drive said induction motor;



volt/frequency control means controlling said inverter to produce a suitable voltage and frequency in a predetermined relationship therebetween;

means for detecting a power factor phase angle between a motor current from said inverter and said inverter output voltage as indicative of an amount of load imposed on the motor;

means for producing a predetermined reference angle;

judge means comparing said detected power factor phase angle with said predetermined reference angle, which is a frequency dependent angle indicative of a standard load at a given frequency, in order to provide a control output in response to which said volt/frequency control section alters said inverter output voltage out of said predetermined relationship with the frequency for improving motor efficiency;

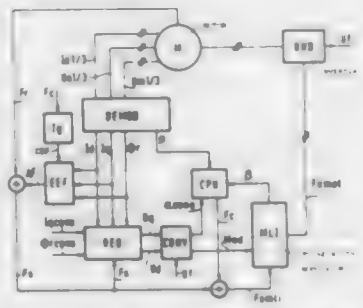
said volt/frequency control means operating to store a plurality of V/F curves, with respect to differing load requirements, each representing a functional relation between said inverter output voltage and the inverter frequency;

said volt/frequency control means operating to designate one of the V/F curves for producing said inverter output voltage determined by said designated V/F curve with respect to a given frequency; and

said volt/frequency control means responding to said first and second control outputs respectively to select from said V/F curves at least one curve having greater and lower inverter output voltages than said designated curve with respect to the given frequency for controlling said inverter to supply said greater and lower inverter output voltages while keeping the selected frequency substantially unchanged.

5,010,288

VECTOR CONTROL SYSTEM FOR A SQUIRREL-CAGE ASYNCHRONOUS ELECTRIC MOTOR



Pierre Poline, Trevoux, France, assignor to GEC Alsthom SA, Paris, France

Filed Mar. 21, 1990, Ser. No. 496,703

Claims priority, application France, Mar. 21, 1989, 89 03685

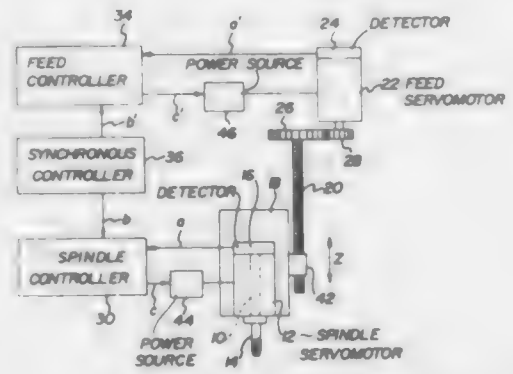
Int. Cl.[5] H02P *5/28*

U.S. Cl. 318—811 **4 Claims**

1. A vector control system for a squirrel-cage asynchronous electric motor powered by a width-modulated pulse generator controlling an inverter which converts a DC feed voltage into at least one AC feed voltage applied to the asynchronous motor, said AC voltage having an amplitude defining a current supplied by the generator to the motor and a flux in the motor, said system comprising means for evaluating magnitude and phase of flux in the motor relative to a fixed frame of reference, means for evaluating first in-phase and quadrature components, relative to said flux in the motor, of the current supplied to the motor, means for evaluating the speed of rotation of the motor, and means for evaluating the DC motor feed voltage, wherein the system further comprises means for determining second in-phase and quadrature components relative to said flux in the motor, which define a control voltage as a function of said first components and of a requested torque value, and wherein the system also comprises means for converting said second components into a corresponding polar representation having a magnitude and phase angle, with the magnitude of said polar representation being supplied directly to said pulse generator in order to control the amplitude of the AC feed voltage applied to the motor, while the phase angle of said polar representation is supplied to a phase control module which also receives said flux phase and a phase value of the voltage produced by the pulse generator, and which establishes a frequency correction value which is added to a stator frequency value to constitute a frequency control signal transmitted to the pulse generator to control the frequency of the AC voltage supplied thereby to the motor, in order that the difference between said flux phase and said phase value tends to equal said phase angle of said polar representation.

5,010,289

ANTI-FROST SYSTEM FOR A WINDSHIELD OF A MOTOR VEHICLE



Hirohisa Takada, Fukaya, Japan, assignor to Fuji Jukogyo Kabushiki Kaisha, Tokyo, Japan

Filed Jan. 19, 1990, Ser. No. 467,614

Claims priority, application Japan, Feb. 15, 1989, 1-37273

Int. Cl.[5] B60L *1/02*; B60S *1/54*

U.S. Cl. 322—8 **5 Claims**

1. A system for preventing frost from accumulating on a windshield of a motor vehicle having a battery and a wiper system including an intermittent wiper unit for intermittently operating a wiper of the vehicle, comprising

a heating element provided on the windshield;

a temperature switch producing a temperature signal when the temperature of the windshield is at about 0° C.;

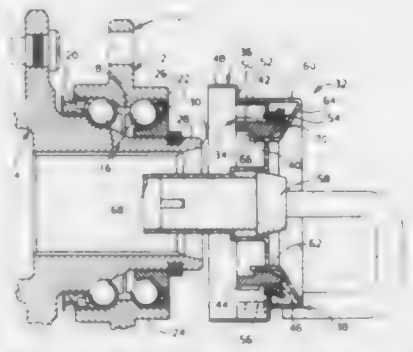
a humidity switch for producing a humidity signal when the humidity of air outside of the windshield becomes about 100%;

a gate responsive to the temperature signal and the humidity signal for producing a frost signal;

switch means provided between the heating element and the battery of the vehicle responsive to the frost signal for energizing the heating element; and

operating means responsive to the frost signal for operating the intermittent wiper unit.

5,010,290



EASILY INSTALLED WHEEL BEARING SENSOR PACKAGE

David A. Foster, Castalia, Ohio, assignor to General Motors Corporation, Detroit, Mich.

Filed Jul. 19, 1990, Ser. No. 554,484

Int. Cl.[5] G01P *3/44*; G01B *7/30*

U.S. Cl. 324—173 **3 Claims**

1 A self contained sensor package adapted to be installed to a bearing, said bearing having a stationary race and coaxial rotating race with an interior annular space between said races maintained by a complement of rolling elements contained within said annular space, said rotating race also having a cylindrical surface located outside of said annular space, said sensor package comprising,

a generally annular sensor ring having a cylindrical mounting surface sized so as to slide closely axially over said rotating race cylindrical surface, said sensor ring also having a magnetic portion, and a rubbing seal surface coaxial to said mounting surface located axially outboard of said magnetic portion,

a generally cylindrical casing adapted to be press fitted axially over said stationary race,

a seal secured to said casing and adapted to sealingly engage said sensor ring seal surface when said sensor ring and casing are maintained coaxial to one another, and,

a shipping and installation jig maintaining said sensor ring and casing in coaxial relation as a package, said jig including a first cylindrical shell press fitted tightly over the outside of said casing, a coaxial, second cylindrical shell fitted slidably over said sensor ring mounting surface, and an annular rim interconnecting said first and second shells at coaxial, circular hinge lines, so that said second shell may shift axially outwardly relative to said first shell while said first and second shells remain coaxial,

whereby said package may be installed to said bearing by sliding said casing axially over the outside of said stationary race as said sensor ring mounting surface simultaneously slides axially over said rotating race cylindrical surface, thereby pushing said jig second cylindrical shell off of said sensor ring and shifting it axially outboard of said first shell, after which said first shell may be removed from said casing, leaving said casing and sensor ring installed to said bearing axially outboard of said annular bearing space, with said sensor ring magnetic portion protected within said casing by said casing seal.

5,010,291

SINGLE QUADRANT CHOPPER TIMING CONTROL CIRCUIT FOR DISCONTINUOUS CURRENT

Charles W. Edwards, Monroeville, Pa., assignor to Westinghouse Electric Corp., Pittsburgh, Pa.

Filed May 29, 1990, Ser. No. 529,844

Int. Cl.[5] H02M *7/44*

U.S. Cl. 323—222 **7 Claims**

7. A single quadrant chopper timing control circuit for providing discontinuous current, comprising:

first summer means for summing a reference voltage and a feedback voltage and outputting a summed voltage;

voltage regulator means for receiving the summed voltage and outputting a current demand signal;

second summer means, for summing the current demand signal, a feedback current, and a mimic current, and outputting a summed current;

hysteresis controller means for receiving the summed current from said second summer means and outputting a hysteresis signal;

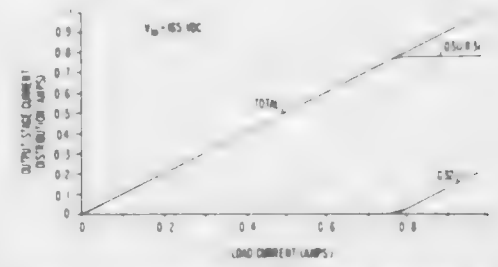
first comparator means for receiving a current, determining whether the current is below a predetermined value, and outputting a signal;

logic means for receiving the hysteresis signal and the signal from said first comparator means and outputting a logic signal;

mimic integrator means for receiving the logic signal and the signal from said first comparator means and for outputting a mimic current when the current from said first comparator means is below the predetermined value, the mimic current being input to said second summer means; and

second comparator means for receiving the mimic current and outputting an enabling signal if the mimic current is greater than or equal to zero.

5,010,292



VOLTAGE REGULATOR WITH REDUCED SEMICONDUCTOR POWER DISSIPATION

Robert L. Lyle, Jr., Knoxville, Tenn., assignor to North American Philips Corporation, New York, N.Y.

Filed Dec. 12, 1989, Ser. No. 449,664

Int. Cl.[5] G05F *1/56*

U.S. Cl. 323—274 **6 Claims**

1. A linear, series pass voltage regulator including an input for receiving an unregulated first DC voltage and including an output for supplying a variable load current at a regulated second DC voltage having a predetermined magnitude, said voltage regulator comprising:

a. a variable impedance output stage electrically connected between the input and the output for carrying the load current; and

b. control circuitry electrically connected to the voltage regulator input and to the output stage for comparing the second DC voltage to a reference voltage and for producing a control signal for controlling the impedance of the output stage to effect maintenance of the second DC voltage at the predetermined magnitude despite variations of the first DC voltage and the load current;

characterized in that the output stage comprises:

(1) a first impedance comprising a series combination of a resistor and a first semiconductor device output impe-

dance electrically connected between the input and the output of the regulator, said first semiconductor device having an input for receiving said control signal to effect variation of the device output impedance;

(2) a second impedance comprising a series combination of a second semiconductor device output impedance and voltage-dropping semiconductor means electrically connected between the input and the output of the regulator, said second semiconductor device having an input for receiving said control signal to effect variation of the device output impedance, said input of said second semiconductor device being electrically connected to the control circuitry for receiving the control signal; and

(3) resistive coupling means electrically connecting a junction between the voltage-dropping semiconductor junction means and the output impedance of the second semiconductor device to the input of the first semiconductor device for coupling the control signal to said input of said first semiconductor device, said control signal effecting, in sequence, a gradual decrease in the first impedance from a high value to a low value as the load current increases to a predetermined magnitude, while the second impedance remains at a value which is much higher than the value of the first impedance, followed by a gradual decrease in the second impedance from said higher value as the load current increases above said predetermined magnitude, while the first impedance remains at said low value

INRUSH CURRENT LIMITING CIRCUIT

William F. Ellersick, Redwood City, Calif., assignor to Raynet Corporation, Menlo Park, Calif.

Filed Nov. 20, 1989, Ser. No. 439,596

Int. Cl.[5] G05F *1/573*

U.S. Cl. 323—278 **13 Claims**

1 An inrush current limiting circuit for limiting initial current flow to a power load characterized by a high capacitive reactance otherwise causing excessive inrush current, the circuit comprising:

plug in connection means to a power source and two conductor paths leading from the plug in connection means,

power FET means having a source element to drain element path in series with one of the conductor paths and having a gate connection,

active current sense means for sensing excessive inrush current including bipolar transistor means connected to shunt the gate element of the power FET means to the potential at its source element when the bipolar transistor means is conducting, and sense resistor means in series with one of the conductor paths for controlling a base element of the bipolar transistor means to cause the bipolar transistor means to conduct when current through the sense resistor exceeds a predetermined amount, and,

bias resistor means connected to the gate element of the power FET means normally to bias the power FET means into full conduction between the source and drain elements when the bipolar transistor means is not conducting.

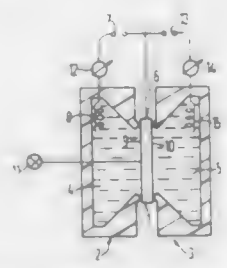
METHOD FOR TOPICALLY-RESOLVED DETERMINATION OF THE DIFFUSION LENGTH OF MINORITY CHARGE CARRIERS IN A SEMICONDUCTOR CRYSTAL BODY WITH THE ASSISTANCE OF AN ELECTROLYTIC CELL



Helmut Foell, and Volker Lehmann, both of Munich, Fed. Rep. of Germany, assignors to Siemens Aktiengesellschaft, Munich, Fed. Rep. of Germany

Filed May 11, 1990, Ser. No. 522,115

Claims priority, application Fed. Rep. of Germany, May 31, 1989, 3917702

Int. Cl.[5] G01R *31/26*

U.S. Cl. 324—158 D **4 Claims**

1. A method for determining the diffusion length L of minority charge carriers in a semiconductor crystal body carrying an ohmic contact, comprising the steps of:

applying a measuring cell having an electrode therein to one side of the semiconductor crystal body so that a first surface thereof is exposed to the interior of the measuring cell;

filling the measuring cell with electrolyte so that the surface and the electrode are in contact with the electrolyte;

applying a voltage between the electrode and the ohmic contact to produce an inhibiting space charge zone at the first surface of the semiconductor crystal body;

irradiating the surface with light having a predetermined wavelength $\lambda > 800$ nm to produce a photocurrent I_l between the first surface and the electrode;

measuring the photocurrent I_l; and

determining the diffusion length L from the equation

$$I_l/I_{l,max} = (\alpha L/(1+\alpha L))\, e^{-\alpha w}$$

where α is the absorption coefficient for radiation having the predetermined wavelength λ, w is the expanse of the inhibiting space charge zone, and $I_{l,max}$ is a calibrated current obtained from a known specimen having an extremely long diffusion length.

5,010,295

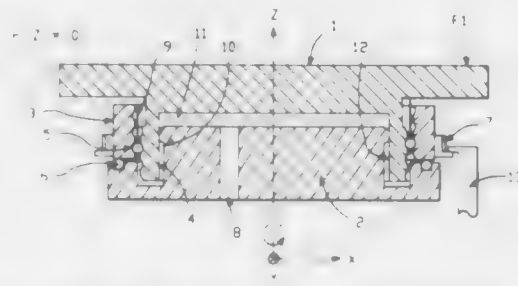
BALL SCREW SUPPORTED Z STAGE

William B. Lindsay, Mountain View, Calif., assignor to General Signal Corporation, Stamford, Conn.

Filed Jun. 14, 1989, Ser. No. 365,878

Int. Cl.[5] G01R *1/02, 1/04*

U.S. Cl. 324—158 R **9 Claims**



1. In a wafer prober, a support stage comprising p1 a chuck top for supporting an external load, said chuck top adapted to be movable up and down with respect to the Z axis,

ball screw means for supporting said chuck top wherein said balls crew means include an outer race and an inner race with corresponding matching helical grooves, one or more spiral rows of balls, a cylindrical ball retainer and an array of balls for supporting said outer race,

a base for supporting said ball screw means,

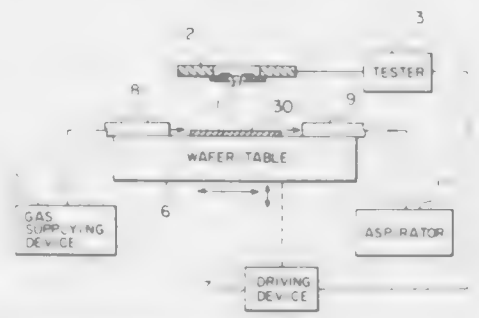
means for applying a vertical preload to said chuck top which is greater than said external load,

said ball screw means including means for radially constraining said chuck top in the XY plane,

said means for applying including a piston connected to said base, a cylinder bore connected to said inner race with a close slip fit to said piston so as to form a chamber, and means for applying a vacuum source to said chamber.

5,010,296

WAFER PROBER



Kazuhisa Okada, Itami, and Ichirou Kusumoto, Kawanishi, both of Japan, assignors to Mitsubishi Denki Kabushiki Kaisha, Japan

Filed Mar. 12, 1990, Ser. No. 492,051

Claims priority, application Japan, Dec. 13, 1989, 1-321470

Int. Cl.[5] G01R *1/06, 31/02*

U.S. Cl. 324—158 P **7 Claims**

1 A wafer prober comprising:

supporting means for supporting a wafer having a plurality of electrode pads disposed on a surface thereof;

a plurality of probes for contacting respective electrode pads on a wafer supported by said supporting means;

a nozzle having a nozzle opening for spraying a gas onto the electrode pads on the wafer contacted by said probes; and

a suction duct having a duct opening for aspirating waste generated by contacting said plurality of probes with the plurality of electrode pads on the wafer and carried by gas sprayed through said nozzle wherein said nozzle opening and said duct opening are disposed directly opposite each other and said plurality of probes are disposed therebetween.

METHOD FOR MEASURING STRESS ON STEEL BY DETERMINING THE REVERSE MAGNETIC PERMEABILITY UNDER A MAGNETIC BIAS FIELD

Hidekazu Nishizawa, Osaka, and Tomoaki Utsunomiya, Ehime, both of Japan, assignors to Nikkoshi Co., Ltd., Tokyo, Japan

Filed Mar. 9, 1990, Ser. No. 491,423
Claims priority, application Japan, Mar. 17, 1989, 1-65364
Int. Cl.[5] G01B *7/24*; **G01R** *33/18*
U.S. Cl. 324—209 **2 Claims**

1 A method for the determination of a stress in a steel material which comprises the steps of

(a) determining the reversible magnetic permeability μ by using a stress detector of steel materials utilizing the phenomenon of magnetostriction under a magnetic bias field H_0 within the range of approach to the saturation magnetization;

(b) calculating the value of M, which is the first-order factor on $1/H_0^3$ for the reversible magnetic permeability μ of the steel material in the equation $\mu = 1 + M/H_0^3$, utilizing the values of μ; and

(c) calculating the values of a principal stress σ_1 in the steel material, the other principal stress σ_2 in the steel material which is in the direction perpendicular to the direction of σ_1 and the angle θ between the direction of σ_1 and the direction at which the reversible magnetic permeability μ is determined, from the equation

$$\sqrt{M} = a + b[(\sigma_1 + \sigma_2) + 3(\sigma_1 - \sigma_2)\cos 2\theta],$$

in which a is the value of the square root of M in a stress-free state and b is the stress sensitivity

CHARGE AMPLIFIER CIRCUIT

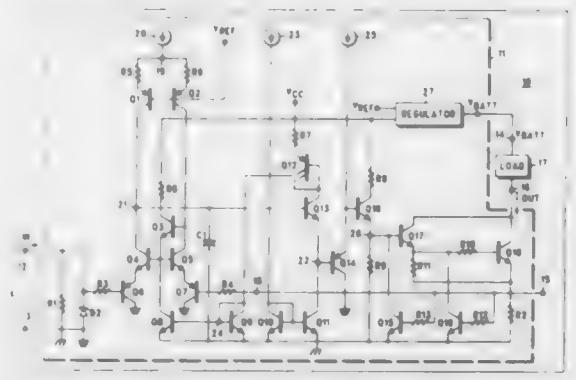
Peter W. Krempl, Kainbach; Guenther Wegscheider, and Gerhard Woess, both of Graz, all of Austria, assignors to AVL Gesellschaft fuer Verbrennungs-kraftmaschinen und Messtechnik m.b.H., Prof. Dr. Dr. h.c. Hans List, Austria

Filed Sep. 1, 1989, Ser. No. 401,822
Claims priority, application Austria, Sep. 2, 1988, 2171/88
Int. Cl.[5] H03F *3/191*
U.S. Cl. 330—107 **7 Claims**

1. A charge amplifier circuit having an input and an output, comprising:

(a) a first stage including an operational amplifier having a signal output that is fed back to a signal input of the operational amplifier via a feedback element including a capacitor and which exhibits a finite resistance, the feedback element defining a break-over frequency f_I defined as $\frac{1}{2}\pi RC$ where R is the resistance of the feedback elements and C is the capacitance of the feedback element, the signal input serving as the input of the charge amplifier circuit;

(b) a second stage including a proportional-integrating (PI) unit having an input coupled to the signal output of the operational amplifier and an output that serves as the output for the charge amplifier circuit, the PI unit having a break-over frequency f_{II}, the frequency f_{II} being substantially equal to the frequency f_I, and



(c) whereby, no signal proportional to the output of the second stage is fed back to the signal input of the first stage.

BALANCED INTEGRATED CIRCUIT DIFFERENTIAL AMPLIFIER

Jeffrey J. Braun, Mesa, Ariz., assignor to Motorola, Inc., Schaumburg, Ill.

Filed Dec. 8, 1989, Ser. No. 447,956
Int. Cl.[5] H03F *3/45*
U.S. Cl. 330—257 **20 Claims**

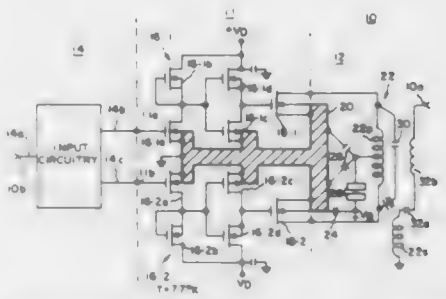
1 An integrated circuit differential amplifier comprising:

differential input stage means including at least a pair of first and second semiconductor devices each having an input electrode, an output electrode and a common electrode, the common electrodes being connected to each other, said input stage means providing at one of said output electrodes a differential signal related to the difference between two input signals each separately coupled to a different one of said input electrodes;

output stage means having an input terminal connected to said one output electrode of said input stage means for amplifying said differential signal and providing said amplified differential signal as an output signal at an output terminal of said output stage means, said output stage means inherently providing a predetermined impedance and current load at said one output electrode of said input stage means by virtue of its connection thereto,

wherein the improvement comprises,

current mirror circuitry for developing a current mirror signal substantially corresponding to output current drawn through said output stage means regardless of any current drawn by any additional circuitry connected to said output terminal; and



load balancing circuit means having current there through determined by said current mirror signal and having an input terminal directly coupled to and loading another one of said input stage output electrodes, wherein said balancing circuit means provides at its input terminal an impedance and current load substantially identical to the impedance and current load provided by said output stage means regardless of any current drawn by any additional circuitry connected to said output terminal, whereby offset variation of said differential signal as a function of conduction of said output stage means is reduced.

CRYOGENICALLY-COOLED RADIO-FREQUENCY POWER AMPLIFIER

Otward M. Mueller, Ballston Lake, and William A. Edelstein, Schenectady, both of N.Y., assignors to General Electric Company, Schenectady, N.Y.

Filed Nov. 3, 1989, Ser. No. 431,361
Int. Cl.[5] H03F *3/26*, *3/16*
U.S. Cl. 330—269 **14 Claims**

1 A radio-frequency (RF) power amplifier, comprising:

at least one active solid-state RF power device, having an input impedance and an output impedance;

input means for matching the input impedance of the at least one active power device to an amplifier input;

output means for matching the output impedance of the at least one active power device to an amplifier output,

the at least one power device further comprising active driving means responsive to an RF signal from the input means;

the power amplifier further comprising substrate means, with high thermal conductivity, for supporting the at least one active power device; and

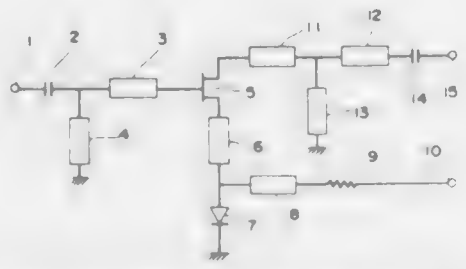
cryogenic means, contacting at least the substrate means, for removing thermal energy from the at least one active power device.

5,010,305

MICROWAVE INTEGRATED CIRCUIT

Nobuo Shiga, Yokohama, Japan, assignor to Sumitomo Electric Industries, Ltd., Japan

Filed Dec. 7, 1989, Ser. No. 447,062
Claims priority, application Japan, Dec. 22, 1988, 63-324357
Int. Cl.[5] H03F *3/16*, *3/60*
U.S. Cl. 330—277 **18 Claims**



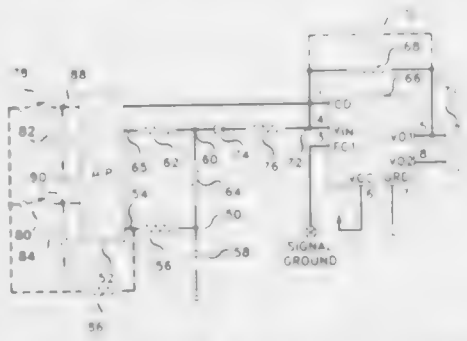
1. A microwave integrated circuit having a plurality of circuit components integrated therein, comprising:

initial stage amplification means having a field effect transistor;

series circuit means having an inductive element connected in series with a variable capacitance element, one end of said series circuit means being connected to a source of

said field effect transistor and the other end being connected to ground, and

control means including a circuit with a microstrip and a resistor which are serially connected for controlling the capacitance of said variable capacitance element by an external signal,



one end of said control means being connected to a junction of said variable capacitance element and said inductive element and said external signal being applied to the other end of said control means.

5,010,306

LOW COST DIGITAL AMPLITUDE REGULATOR

Walter G. Kutzavitch, Freehold, and Eugene J. Rosenthal, Highland Park, both of N.J., assignors to AT&T Bell Laboratories, Murray Hill, N.J.

Filed Feb. 20, 1990, Ser. No. 482,442
Int. Cl.[5] H03G 3/18
U.S. Cl. 330—284 15 Claims

1. Apparatus for digitally regulating the magnitude of an output signal derived from an input signal comprising:

means for generating a stream of pulses with a controllable variable duty cycle;

means for controlling said duty cycle of said pulses;

means for supplying said generated stream of variable duty cycle pulses;

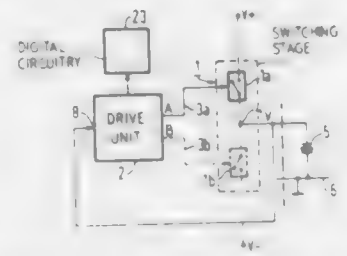
first means for filtering said supplied stream of variable duty cycle pulses to develop a DC voltage, the magnitude of said DC voltage being responsive to and proportional with the duty cycle of said stream of pulses;

an input signal source for supplying said input signal;

means for devloping a composite output signal containing components of said input signal and said DC voltage;

a source of a predetermined threshold level;

second means supplied with said composite output signal and being responsive to said predetermined threshold level for filtering any portion of said composite signal the magnitude of which is below said threshold level and for supplying as an output a filtered version of said composite signal; and



amplifier means for amplifying said output of said second means to generate an output signal having a prescribed output magnitude.

OSCILLATOR HAVING PERIODICALLY PULSED CRYSTAL

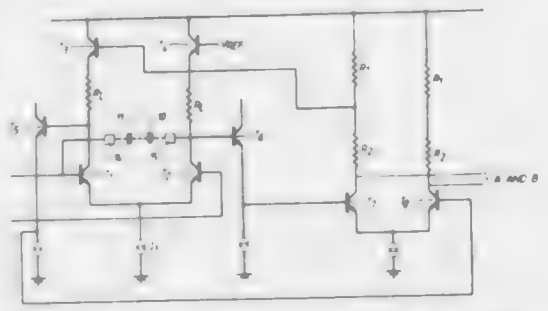
Hans G. Strandberg, Lundbyberg, Sweden, assignor to Siemens Aktiengesellschaft, Munich, Fed. Rep. of Germany

Filed Jan. 19, 1990, Ser. No. 467,180
Claims priority, application European Pat. Off., Jan. 20, 1989, 89100970.6
Int. Cl.[5] H03B 5/36
U.S. Cl. 331—116 FE 10 Claims

1. An oscillator circuit for use with a supply line at a voltage having a polarity and a line at reference potential, said oscillator circuit comprising:

a crystal having a first terminal connected to said line at reference potential, and a second terminal;

switch means having an output directly connected to said second terminal of said crystal, a control input, and being connected to said supply line for, when closed, connecting said supply line to said crystal to energize said crystal so that said crystal generates an output signal which executes a periodic oscillation; and



drive means having an input connected to said output of said switch means and having an output connected to said control input of said switch means for closing said switch means for a fraction of a half-period of said periodic oscillation during those half-periods which have the same polarity as said supply line voltage.

5,010,308

CRYSTAL OSCILLATOR WITH OFFSET AND HYSTERESIS

Nicholas P. Cowley, Wroughton, United Kingdom, assignor to Plessey Overseas Limited, Ilford, England

PCT No. PCT/GB89/00420, § 371 Date Mar. 7, 1990, § 102(e) Date Mar. 7, 1990, PCT Pub. No. WO89/11180, PCT Pub. Date Nov. 16, 1989
PCT Filed Apr. 20, 1989, Ser. No. 438,453
Claims priority, application United Kingdom, May 11, 1988, 8811193
Int. Cl.[5] H03B 5/36
U.S. Cl. 331—116 R 3 Claims

1. A crystal oscillator comprising a pair of differentially arranged transistors to the bases of which an input signal may be differentially applied, a crystal and a capacitor being connectable between the collector of a first of the transistors and the base of a second of the transistors, the oscillator outputs being provided differentially on the collectors of the first and second transistors, and a feedback loop established by an output of one of the transistors serving to drive a further transistor connected as a load in the collector of the other of the transistors

CERAMIC BLOCK FILTER WITH CO-FIRED COUPLING PINS

Keith R. Manssen, Long Grove, and Michael F. Moutrie, Buffalo Grove, both of Ill., assignors to Motorola, Inc., Schaumburg, Ill.

Filed Dec. 22, 1989, Ser. No. 455,725
Int. Cl.[5] H01P 1/202
U.S. Cl. 333—206 12 Claims

1 A filter, comprising:

a dielectric block having top, bottom and side surfaces and having at least first and second holes each extending from the top surface toward the bottom surface, said bottom and said surfaces and said first and second holes being substantially covered with a conductive material for producing producing first and second transmission line resonators;

first resonator electrode means disposed on the top surface of said dielectric block and connected to the conductive material of said first hole;

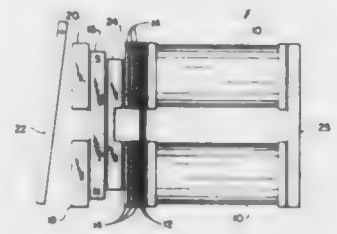
second resonator electrode means disposed on the top surface of said dielectric block and connected to the conductive material of said second hole;

first coupling electrode means disposed on the top surface of said dielectric block for capacitively coupling to said first resonator electrode means of said first hole, said first coupling electrode means including a hole having surfaces covered with a conductive material;

second coupling electrode means disposed on the top surface of said dielectric block for capacitively coupling to said second resonator electrode means of said second hole, said second coupling electrode means including a hole having surfaces covered with a conductive material;

a first coupling pin having a portion disposed in the hole in said first coupling electrode means;

a second coupling pin having a portion disposed in the hole in said second coupling electrode means; and



said conductive material and said first and second coupling pins having been simultaneously co-fired for bonding said conductive material to said dielectric block, for bonding said first coupling pin to the conductive material of said first coupling electrode means and hole in said first coupling electrode means, and for bonding said second coupling pin to the conductive material of said second coupling electrode means and hole in said second coupling electrode means.

5,010,310

ALTERNATING CURRENT IMMUNIZED RELAY AND METHOD OF IMMUNIZING A RELAY TO ALTERNATING CURRENT

Klaus H. Frielinghaus, Rochester, N.Y., assignor to General Signal Corporation, Stamford, Conn.

Filed Jun. 16, 1988, Ser. No. 208,181
Int. Cl.[5] H01F 7/10
U.S. Cl. 335—243 7 Claims

1. A relay apparatus which comprises:

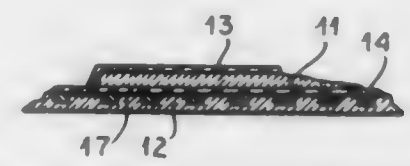
an armature;

means for pivotally mounting said armature;

first and second pole pieces dimensioned, configured and disposed for cooperation with said armature;

a magnetic circuit including at least one coil;

a plurality of iron shunt lamina spanning said magnetic circuit intermediate at least said one coil and said first and second pole pieces; and



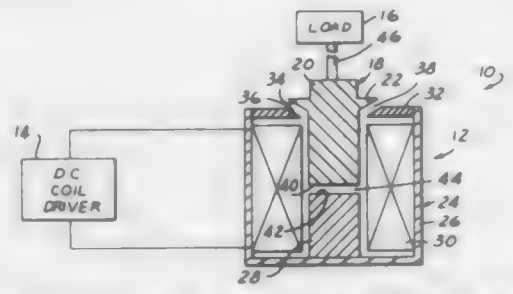
a plurality of copper washer slugs in said magnetic circuit intermediate at least one of said first and second pole pieces and said iron shunt lamina.

5,010,311

ELECTRONIC MODULATION OF MAGNETIC FIELDS

Aharon Z. Hed, Nashua, N.H., assignor to International Superconductor Corp., Riverdale, N.Y.

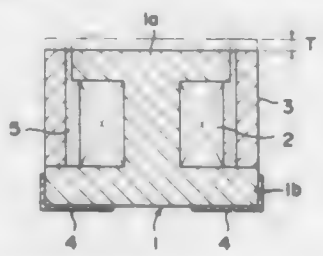
Filed Feb. 22, 1989, Ser. No. 314,426
Int. Cl.[5] H01F 7/22
U.S. Cl. 335—216 18 Claims



1. A method of modulating a magnetic field, comprising the steps of:

(a) establishing a magnetic field to be modulated;

(b) inserting into said magnetic field a generally flat solid body of a superconductive material having a critical temperature T_c below which the body is superconductive, a critical current density J_c at which said body has a transition between superconductive and nonsuperconductive states and a critical magnetic field H_c which is a function of temperature and current and above which superconductivity of said body is quenched to a mixed state transitting to the nonsuperconductive state said body being positioned to have its major dimensions in a plane perpendicular to said field; and



(c) controllably periodically or intermittently and reversibly altering the state of said body from one of said states to another of said states, thereby modulating said magnetic field.

5,010,312
SOLENOID ACTUATORS
Krystyn Motykiewicz, Southington, Conn., assignor to Rostra Engineered Components, Waterbury, Conn.
Filed Apr. 10, 1990, Ser. No. 507,025
Int. Cl.[5] H01F 7/08
U.S. Cl. 335—261 12 Claims

1. A solenoid actuator that comprises: an armature including a ferromagnetic body mounted for movement through a stroke along a defined axis, and a stator including an electrical coil surrounding said axis and a ferromagnetic stator body having a first portion axially opposed to said armature body and a second portion radially surrounding and spaced from said armature body, characterized in that said armature further includes ferromagnetic means moveably mounted on said armature body radially adjacent and opposed to said second portion of said stator body, said means and said second portion of said stator body having opposed axially overlapping tapering surfaces that are symmetrical with respect to said axis.

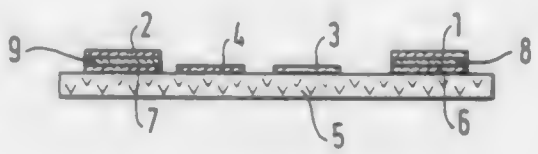
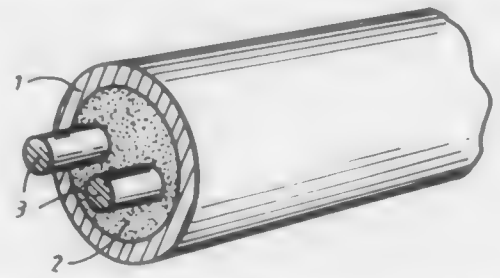
CHIP COIL
Toshimi Kaneko; Tetsuya Morinaga, and Tetsuo Hatakenaka, all of Nagaokakyo, Japan, assignors to Murata Manufacturing Co., Ltd., Nagaokakyo, Japan
Filed May 30, 1990, Ser. No. 530,402
Claims priority, application Japan, Jun. 2, 1989, 1-141896
Int. Cl.[5] H01F 3/00
U.S. Cl. 335—296 3 Claims

1. A chip coil comprising:
a core made of a magnetic material;
a coil wound around the core;
a sleeve core enclosing the coil, the sleeve core made of a magnetic material,
wherein the upper surface of the core and the upper surface of the sleeve core are ground so as to adjust the inductance of the chip coil.



5,010,314
LOW-PROFILE PLANAR TRANSFORMER FOR USE IN OFF-LINE SWITCHING POWER SUPPLIES
Alexander Estrov, Newton, Mass., assignor to Multisource Technology Corp., Waltham, Mass.
Filed Mar. 30, 1990, Ser. No. 502,523
Int. Cl.[5] H01F 27/30
U.S. Cl. 336—198 3 Claims

1. A transformer assembly comprising:
a. first and second bobbin members of insulating material, each said bobbin member having a pair of opposed planar surfaces defining a central aperture therein, at least one of the bobbin members having a raised wall extending from each surface and encircling said aperture;
b. a first planar conductive winding disposed adjacent a first surface of the at least one bobbin member;
c. a second planar conductive winding disposed adjacent a second surface of the at least one bobbin member;



d. first and second core members;
e. insulation means between the first winding and the first core member; and
f. the first and second core members defining a magnetic path through the central aperture and linking the first and second windings.

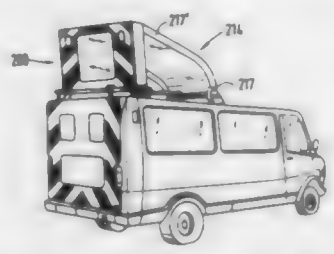
SATELLITE BASED SIMULCAST PAGING SYSTEM
Robert J. Schwendeman, Pompano Beach, and William J. Kuznicki, Coral Springs, both of Fla., assignors to Motorola, Inc., Schaumburg, Ill.
Filed Nov. 30, 1989, Ser. No. 444,457
Int. Cl.[5] H04Q 1/30
U.S. Cl. 340—311.1 30 Claims

12 A simulcast paging communication system, comprising.
a plurality of terrestrial receivers, at least some of which are capable of receiving paging information simulcast from at least one satellite and one or more terrestrial stations;
the terrestrial stations being capable of simulcasting the paging information with at least one satellite, and capable of adapting the paging information so as to be compatible with at least one of the plurality of terrestrial receivers; and
at least one satellite capable of simulcasting the paging information to at least one terrestrial station for reception by at least one of the plurality of terrestrial receivers.

5,010,318
SYSTEM FOR DETECTING MALFUNCTION OF TURBINE SPEED MEASURING DEVICE FOR TORQUE CONVERTER OF AUTOMOTIVE AUTOMATIC TRANSMISSION
Hiroshi Yamaguchi, Yokohama, Japan, assignor to Nissan Motor Co., Ltd., Yokohama, Japan
Filed Mar. 19, 1990, Ser. No. 495,123
Claims priority, application Japan, Apr. 19, 1989, 1-99836
Int. Cl.[5] B60Q 9/00; G08B 21/00
U.S. Cl. 340—439 6 Claims



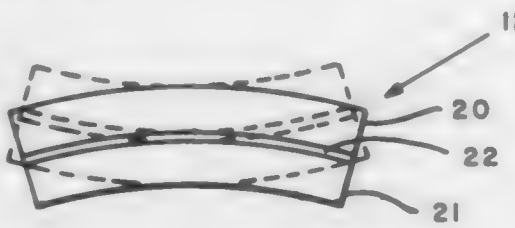
1. In a unit including an engine, a torque converter and a transmission gear train,
a first sensor issuing a first information signal representative of the rotation speed of an output means of said engine;
a second sensor issuing a second information signal representative of the rotation speed of an output means of said torque converter;
a third sensor issuing a third information signal representative of the rotation speed of an output means of said transmission gear train;
first means for respectively determining first, second and third reference minimum speeds of the respective output means of said engine, said torque converter and said transmission gear train; and
second means for issuing an alarm signal when the rotation speed derived from said first information signal is higher than said first reference minimum speed, the rotation speed derived from said third information signal is higher than said third reference minimum speed and the rotation speed derived from said second information signal is lower than said second reference minimum speed.

5,010,319
WARNING LIGHT DEVICE
Erich Killinger, Gaggenau, Fed. Rep. of Germany, assignor to Dambach-Werke GmbH, Fed. Rep. of Germany
Filed Oct. 2, 1989, Ser. No. 416,061
Claims priority, application Fed. Rep. of Germany, Oct. 1, 1988, 3833544
Int. Cl.[5] B60Q 1/26
U.S. Cl. 340—472 6 Claims

1. A warning light device having a warning panel (25), for regulating traffic, attached in a vertical position near a rear of a motor vehicle and various traffic symbols being displayed on said warning panel (25) with controllable electric luminous elements, the warning light device comprising: said warning panel (25) having a controllable optical fiber display matrix

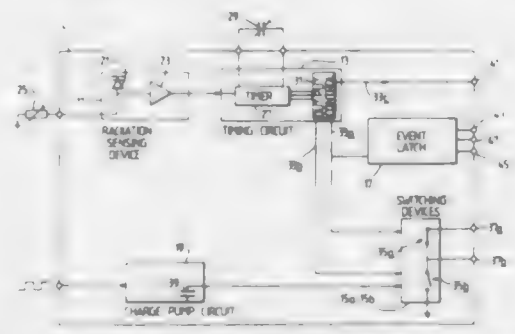
(12), said matrix having a plurality of optical fiber bundles (50, 51) illuminated at one end by individually triggerable light sources (40–43) to define said various traffic symbols, and said optical fiber bundles (50, 51) at their opposite ends having free ends of individual optical fibers (29–32) near said optical fiber display matrix (12), said free ends terminating in positions to display said various traffic symbols (17, 18), said warning panel (25) being attached to a roof of and extending to said rear of said motor vehicle (14);

at least one of an electric power supply system (11) of said motor vehicle (14) and a supplementary electric power pack (23) mounted in said motor vehicle (14) for supplying power to the warning light device (10), an operating panel (13) disposed near a dashboard of said motor vehicle (14)



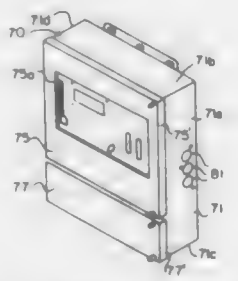
for switching the warning light device (10) on and off and for initiating displays of said various traffic symbols (17, 18) on said optical fiber display matrix (12);

said operating panel (13), at least one of said electric power supply system (11) and said supplementary electric power pack (23), and said optical fiber display matrix (12) being connected through connecting cables (16, 19) installed within said motor vehicle (14); and



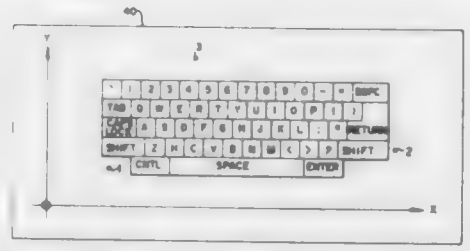
a spoiler (214) pivotally attached to a rooftop stand construction, remote from a swivel shaft of a holder (202), said spoiler (214) covering said optical fiber display matrix (12) which is folded onto said roof both in an operating position and in a folded-down position, with a cross section of said spoiler (214) converging toward a front of said motor vehicle (14).

5,010,320
SELF MODULATING ELECTRONIC ARTICLE SURVEILLANCE MARKER
Robert A. Cordery, Danbury, Conn., assignor to Pitney Bowes Inc., Stamford, Conn.
Filed Dec. 8, 1989, Ser. No. 448,183
Int. Cl.[5] G08B *13/24*
U.S. Cl. 340—551 **10 Claims**



1. In an electronic surveillance marker that includes a magnetostrictive first element adapted to experience a dimensional change in a first direction in the presence of a magnetic field, the improvement comprising a second element firmly affixed to said first element, said second element being of a substantially non-magnetostrictive material, whereby said first element bends in the presence of a magnetic field and said bending varies the susceptibility of said first element.

5,010,321
NUCLEAR EVENT DETECTORS
David J. Larser, Lynsted, and Clive D. Goodchild, Northfleet, both of England, assignors to Gec-Marconi Limited, England
Filed Oct. 2, 1989, Ser. No. 416,052
Claims priority, application United Kingdom, Oct. 5, 1988, 8823398
Int. Cl.[5] G08B *17/12*
U.S. Cl. 340—600 **4 Claims**



1. A nuclear event detector for use in the protection of electronic equipment having a plurality of devices, comprising: radiation sensing means for producing an output in response to the incidence thereon of radiation above a threshold level; timing circuit means responsive to the output of the sensing means for producing first and second control signals; a first terminal for connection to a first power supply line for first devices of the equipment which are not to be protected on the occurrence of a nuclear event; a second terminal for connection to a second supply line for second devices of the equipment which are to be protected on the occurrence of a nuclear event; controllable first electrical switching means for providing a normally closed first switch path between said first and second terminals; and controllable second electrical switching means for providing a normally open second switch path between said second terminal and ground; said first and second switching means being controlled by said first and second control signals respectively so that in response to the incidence of radiation on said sensing means above said threshold level said first switch path opens, thereby to isolate said second power supply line from said first power supply line; and thereafter said second switch path closes, thereby to shunt to ground residual stored electrical energy in said second devices connected with said second power supply line.

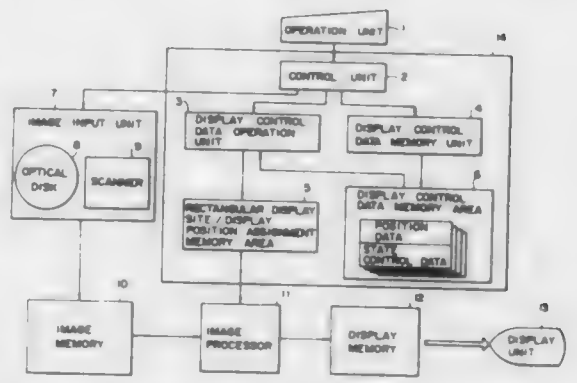
5,010,322
HOUSING FOR A PROCESS CONTROLLER
John J. Fry; George R. Hall, II, both of Wickliffe, and Robert A. Smith, Mentor, all of Ohio, assignors to Gas Research Institute, Chicago, Ill.
Continuation-in-part of Ser. No. 84,689, Aug. 12, 1987. This application Dec. 21, 1988, Ser. No. 287,734
Int. Cl.[5] G09G *1/00*
U.S. Cl. 340—700 **7 Claims**

1. A housing for a process controller means in a system including a sensor assembly having at least one sensing means for providing an output signal indicative of a parameter of the process, the process controller means receiving and processing the output signal and generating control outputs for maintaining a desired operation of the process, said housing comprising: a body portion including a generally box-like member having top and bottom walls, a side wall, first and second end walls, and an open side, cover means pivotally mounted on said member adjacent said open side and movable between an open position and a closed position, said cover means in its closed position overlying said open side to close said body portion, said body portion defining means for mounting said process controller means within said member and means for mounting connection means within said member, said connection means constructed and arranged for connecting said process controller means to said sensor assembly, said member defining flange means extending along the periphery of its open side, and when said cover means is in its closed position, said cover means having a first portion extending in overlying relation with said flange means defining a first gap, and a second portion in overlying relation with portions of said top, bottom and side walls defining a second gap which extends perpendicular to said first gap, the ratio of the length of the overlapping portions of said member and said cover means to the width of one of said gaps therebetween being in the range of about 15:1 to 20:1 and the ratio of the length of the overlapping portions of said member and said cover means to the width of the other of said gaps being in the range of about 5:1 to about 10:1, thereby defining a closed housing which substantially attenuates electromagnetic radio frequency interference thereby isolating said process controller means therefrom whenever said cover means is in its closed position.

5,010,323
INTERACTIVE OVERLAY DRIVEN COMPUTER DISPLAY SYSTEM
Clifford J. Hoffman, 120 Spirea Dr., Dayton, Ohio 45419
Filed May 9, 1988, Ser. No. 191,379
Int. Cl.[5] G09G *5/00*
U.S. Cl. 340—706 **21 Claims**

1. An overlay driven stored file display system comprising:

(a) a tablet and stylus means for providing a coordinate signal representative of the coordinates of any of a plurality of points on the tablet selected by the position of said stylus on said tablet;



(b) storing means for addressably storing a plurality of files each at a unique file address;

(c) an overlay for random placement on said tablet, said overlay having positioned thereon at least three points having a unique angular relationship defining a file address;

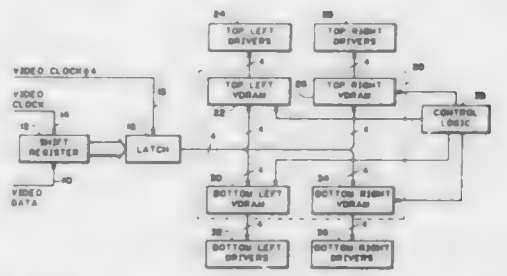
(d) means responsive to the coordinate signals generated when said stylus is sequentially positioned at each of said three points on said overlay for translating and normalizing the coordinates of the file address of the overlay to an overlay management space such that the file address of said overlay, corresponding to a unique file address of said storing means, causes an access of said storing means to retrieve a stored file; and

(e) means for displaying the retrieved file.

5,010,324
SEQUENTIAL PAGE UNIT IMAGE DISPLAY DEVICE HAVING DISPLAY CONTROL MEMORY
Hikari Yamamoto, Kanagawa, Japan, assignor to Hitachi, Ltd., Tokyo, Japan
Filed Sep. 16, 1988, Ser. No. 245,210
Claims priority, application Japan, Sep. 16, 1987, 62-231716
Int. Cl.[5] G09G *5/00*
U.S. Cl. 340—723 **7 Claims**

1. An image display device, comprising:

an operation input means for receiving an operator's instruction;



a display means for displaying image data of a page unit;

a display control data generator means for generating display control data for controlling a display state and a display position by enlarging, reducing, rotating or scrolling the image data of a page unit in accordance with an operator's instruction;

a display control data memory means for storing display control data of a display state position and a display state generated by said display control data generating means; and

a display control means for controlling a display state of image data of a next page by using the display control data stored in said display control data memory means in accordance with an instruction input by an operator.

5,010,325
DRIVING NETWORK FOR TFEL PANEL EMPLOYING A VIDEO FRAME BUFFER
Michael J. Zinchkovski, Portland, Oreg., assignor to Planar Systems, Inc., Beaverton, Oreg.
Filed Dec. 19, 1988, Ser. No. 286,231
Int. Cl.[5] G09G *3/30*
U.S. Cl. 340—781 **5 Claims**

1. A driving network for an AC TFEL panel including orthoganally disposed sets of scanning and data electrodes sandwiching an electroluminescent laminar structure comprising:

(a) n independently driven sets of data electrodes;

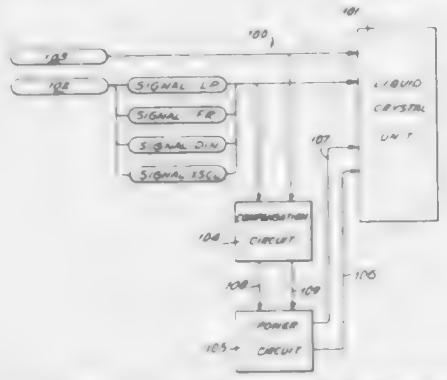
(b) a buffer memory for each of said sets for storing video data;

(c) clock means for storing said video data in said buffer memories at a rate of m bits per clock pulse where the frequency of said clock means is f_1;

(d) data output means for asynchronously extracting said video data from said buffer memories at a second clock frequency, f_2, wherein m×n bits are extracted from the buffer memories per clock pulse wherein f_2 is less than F_1 and wherein m×n f_2 is greater than mf_1.

5,010,326

CIRCUIT FOR DRIVING A LIQUID CRYSTAL DISPLAY DEVICE



Katsunori Yamazaki, and Mitsuo Nagato, both of Suwa, Japan, assignors to Seiko Epson Corporation, Tokyo, Japan

Filed Aug. 15, 1988, Ser. No. 232,750

Claims priority, application Japan, Aug. 13, 1987, 62-202154; Feb. 9, 1988, 63-27922; Feb. 9, 1988, 63-27923; Feb. 9, 1988, 63-27924

Int. Cl.[5] G09G 3/36

U.S. Cl. 340—784 **41 Claims**

1. A matrix liquid crystal display device for displaying characters or a pattern comprising:

a first substrate,

a plurality of common electrodes being formed on said first substrate;

a second substrate;

a plurality of segment electrodes being formed on said second substrate,

a liquid crystal layer sandwiched between said first substrate and said second substrate;

multiplex driving means for providing a common voltage waveform including a selected voltage or a non-selected voltage to said plurality of common electrodes and providing a segment voltage waveform including an ON voltage or an OFF voltage to said plurality of segment electrodes,

compensation means for compensating at least one of said common voltage waveform or said segment voltage waveform based upon said pattern or said characters to be displayed in said liquid crystal display device; and

said common electrodes intersecting said segment electrodes to define a matrix having a dot at each intersection, the dots being in either an ON state or an OFF state depending on the voltage applied to the intersecting common and segment electrodes, said multiplex driving means sequentially switching the selected voltage among the common electrodes, the compensation means receiving a data signal representative of the characters or pattern to be displayed, and producing a sign signal and strength signal, said multiplex driving means providing a common voltage waveform or a segment voltage waveform in which at least one portion of each waveform changes in a direction and size based on the sign signal and the strength signal.

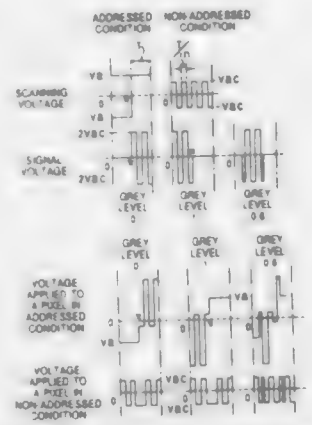
METHOD OF DRIVING A LIQUID CRYSTAL MATRIX PANEL



Naohide Wakita, Kobe; Tsuyoshi Uemura, Higashiosaka; Hiroyuki Ohnishi, Ikeda; Noriko Ohba, Nara; Isao Ota, Osaka, and Shingo Fujita, Katano, all of Japan, assignors to Matsushita Electric Industrial Co., Ltd., Osaka, Japan

Filed Sep. 5, 1986, Ser. No. 903,773

Claims priority, application Japan, Sep. 6, 1985, 60-198010; Sep. 6, 1985, 60-198012; May 9, 1986, 61-107003

Int. Cl.[5] G09G 3/36

U.S. Cl. 340—784 **9 Claims**

1. A method of driving a liquid crystal matrix panel where a ferroelectric liquid crystal having negative dielectric anisotropy is held between scanning electrodes and signal electrodes crossing the scanning electrodes to form a matrix of pixels at crossing positions of the scanning and signal electrodes, comprising the steps of:

applying signal voltage pulses to a signal electrode and addressing voltage pulses to a scanning electrode in an addressed condition so as to make an addressed pixel at the crossing position of the signal electrode and the scanning electrode to be a desired molecular orientation state; and

applying to the scanning electrode, in a non-addressed condition following the addressed condition, voltage pulses whose frequency is higher than that of the addressing voltage pulses and higher than a frequency in which spontaneous polarization of the ferroelectric liquid crystal can follow and whose average voltage is zero so that the effective value of voltage pulses applied to the pixel in the non-addressed condition becomes a substantially constant value greater than an effective threshold voltage at which a molecular orientation stabilizing effect begins to be produced by the dielectric anisotropy, whereby the state of the pixel made in the addressed condition is held in the non-addressed condition until a next addressed condition.

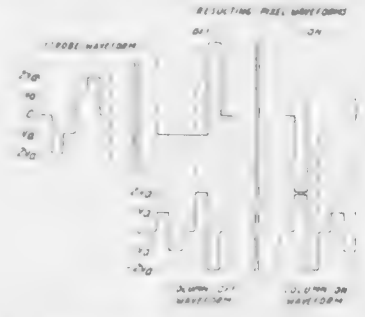
DISPLAY DEVICE

Christopher J. Morris, Feltham; Ian Coulson, Maidenhead, and Paul W. H. Surguy, Uxbridge, all of England, assignors to Thorn EMI plc, London, England



Filed Jul. 18, 1988, Ser. No. 220,316

Claims priority, application United Kingdom, Jul. 21, 1987, 8717172; Aug. 3, 1987, 8718351

Int. Cl.[5] G09G 3/00

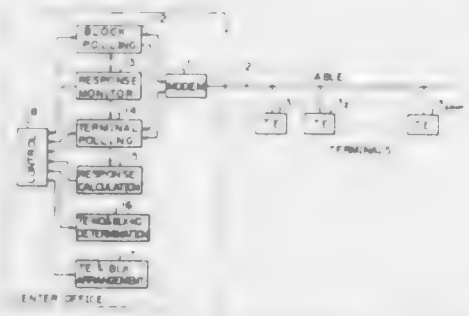
U.S. Cl. 340—784 **18 Claims**

1. A method of addressing a matrix-array type liquid crystal cell with a ferroelectric liquid crystal layer having a plurality of pixels defined by areas of overlap between members of a first set of electrodes on one side of the liquid crystal layer and members of a second set of electrodes on the other side of the liquid crystal layer, each of said pixels having a first and a second optically distinguishable state, and having a response time for switching between said first and said second states which depends on the potential difference across the liquid crystal layer, the method including the step of applying a switching pixel waveform to a selected pixel to switch said selected pixel between said first and second states wherein said switching pixel waveform is charge-balanced and comprises a switching pulse having a pulse width and pulse height magni-

tude which, in combination, switch said selected pixel and another pulse, contributing to charge balancing, having a pulse height magnitude greater than the pulse height magnitude of said switching pulse and a pulse width which is less than that of the switching pulse and which, in combination with the pulse height magnitude thereof, is insufficient to switch said selected pixel, thereby to enable charge balanced addressing of said pixel with a waveform having a duration less than twice that of the switching pulse.

5,010,329

BLOCK POLLING DATA COMMUNICATION SYSTEM HAVING OPTIMUM BLOCK DETERMINATION MEANS



Kaoru Nagakura, Kawasaki, Japan, assignor to Fujitsu Limited, Kawasaki, Japan

Continuation of Ser. No. 180,320, Apr. 11, 1988, abandoned. This application Aug. 2, 1990, Ser. No. 562,412

Claims priority, application Japan, Apr. 10, 1987, 62-88507

Int. Cl.[5] G05B 23/02

U.S. Cl. 340—825.080 **27 Claims**

1. A block polling data communication system, comprising a center office;

a plurality of terminals, divided into a plurality of terminal blocks, each including at least one terminal; and

a cable connecting the center office and the terminals,

said center office including

block polling means for performing operations polling the terminal blocks,

response monitor means, operatively connected to the block polling means to cooperate therewith, for detecting and storing a request signal for a data transfer for a terminal in the terminal block of which the polling is effected,

terminal polling means, operatively connected to the response monitor means, for performing operations sequentially polling all of the terminals in each terminal block in which at least one terminal responded to the polling and issued the request for the data transfer, and terminal and block rearrangement means for obtaining an average frequency of occurrences of requests from all of said terminals by counting a number of requests received in said center office from among all of said terminals and dividing by a number of times each of said terminals was polled, determining an optimum number of terminal blocks based on the average frequency so that a total polling time for the operations by said block polling means and said terminal polling means is minimized, and allocating said terminals into said optimum number of terminal blocks,

the block polling means effecting the polling of the terminal blocks rearranged by the terminal and block rearrangement means, and

the terminal polling means effecting the polling of each terminal in the terminal blocks determined at the terminal and block rearrangement means in which at least one terminal responded to the polling from the block polling means.

PAGING SYSTEM EMPLOYING DESIGNATED FRAME COMMENCING INFORMATION SERVICE DATA MESSAGE TRANSMISSION

Gregory O. Snowden, Boca Raton; Clifford E. Barrett, III, and Fernando Gomez, both of West Palm Beach, all of Fla., assignors to Motorola, Inc., Schaumburg, Ill.

Filed Dec. 26, 1989, Ser. No. 456,423

Int. Cl.[5] H04B 7/00

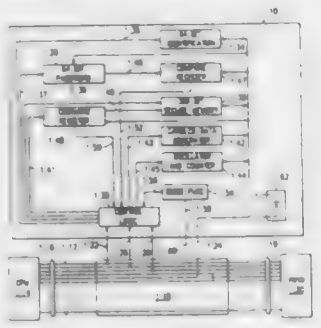
U.S. Cl. 340—825.21 **33 Claims**

1. A system for selective radio communication of call information from a transmitting terminal to a population of selectively addressable receivers, said transmitting terminal being operative to transmit said information periodically in transmission periods comprising a plurality of batches, each batch commencing with a predetermined synchronization code followed by a predetermined plurality of sequential frames which may include an individual selective call address of a receiver followed by an individual or group data message for said addressed receiver, each receiver being assigned one frame of each transmission batch, and operative to search for its individual selective call address in said assigned frame in each transmission batch and, when addressed, to receive the associated data message in subsequent frames, said system comprising:

a subset of information service subscribing receivers of said population of receivers;

said transmitting terminal for also transmitting in at least one batch of a transmission period an information service call address in each of the assigned frames of said subset of receivers, and, when said information service call address has been transmitted in all of the assigned frames of said receivers of said subset, for transmitting, in the same transmission period, an associated information service data message in frames subsequent the synchronization code of a designated batch subsequent said at least one batch; and

each said receiver of said subset being programmed to search each batch of a transmission period, for said information service call address solely in its assigned frame and, when addressed by said information service call address, to receive the associated information service data message in frames subsequent the synchronization code of said designated subsequent batch of the same transmission period



5,010,331
TIME-KEY INTEGRATED CIRCUIT

Donald R. Dias, Carrollton; Robert D. Lee, Denton; Michael L. Bolan, Dallas, and Francis A. Scherpenberg, Carrollton, all of Tex., assignors to Dallas Semiconductor Corporation, Dallas, Tex.

Continuation-in-part of Ser. No. 163,082, Mar. 2, 1988, Pat. No. 4,935,645, and a continuation-in-part of Ser. No. 163,279, Mar. 2, 1988, Pat. No. 4,897,860, and a continuation-in-part of Ser. No. 412,767, Sep. 26, 1989, Pat. No. 4,943,804, which is a continuation of Ser. No. 163,281, Mar. 2, 1988, Pat. No. 4,870,401, and a continuation of Ser. No. 163,280, Mar. 2, 1988, and a continuation of Ser. No. 273,698, Nov. 21, 1988. This application Nov. 14, 1989, Ser. No. 437,012

Int. Cl.[5] **H04Q** *1/00*; **H01H** *47/00*

U.S. Cl. 340—825.310 **1 Claim**

1. An electronic key, comprising:

a timing circuit which can be calibrated;

a fusing and detection circuit, comprising:

a fuse element;

a fuse input terminal, connected so that said fuse element can be blown by applying a large abnormal voltage to said fuse input terminal;

a comparator,

having first and second inputs operatively connected to said fuse element in such relation that

said first input of said comparator receives a voltage which is dependent on the state of said fuse element

and said second input of said comparator receives a voltage which is not substantially dependent on the state of said fuse element,

wherein said comparator compares said first and second inputs and provides a logic output which, in a first state, indicates that said fuse element has not been blown, and, in a second state, indicates that said fuse element has been blown;

wherein said fuse input terminal is operatively connected to said inputs of said comparator in such relation that any large abnormal voltage which is applied to said fuse input terminal will tend to drive the output of said comparator into said second state;

wherein said output of said comparator is connected to said timing circuit so that said second output state of said comparator prevents calibration of said timing circuit;

a counter, connected to count accesses to said electronic key;

control logic including a latch which can be set by receipt of a predetermined external command, said control logic being configured so that

at least some commands are accepted before said fuse element has been blown but are not accepted after said fuse element is blown;

at least some other commands are accepted after said fuse element has been blown and before said latch has been set, but are not accepted after said latch has been set; and

at least some other commands are accepted after said latch has been set and before said counter counts off a predetermined number of accesses, but are not accepted after said counter has counted said predetermined number of accesses;

wherein said latch cannot be reset after said fuse element has been blown,

and wherein said control logic and said counter are configured so that, if power is restored after said fuse element has already been blown, said counter will immediately provide an output indicating that said predetermined number of accesses has already occurred.

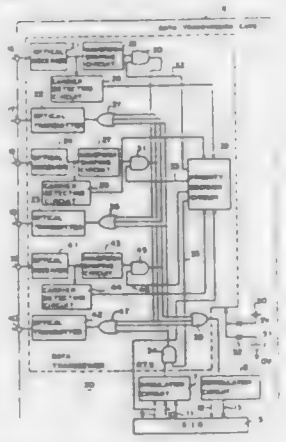
DATA TRANSMISSION APPARATUS



Noritaka Egami, Nagasaki, Japan, assignor to Mitsubishi Denki Kabushiki Kaisha, Tokyo, Japan

Continuation-in-part of Ser. No. 228,509, Aug. 5, 1988, abandoned. This application May 25, 1990, Ser. No. 528,287

Claims priority, application Japan, Aug. 6, 1987, 62-195181

Int. Cl.[5] **H04Q** *1/00*

U.S. Cl. 340—825.5 **5 Claims**

1. A data transmission apparatus for use in each of a plurality of stations of a communication system, comprising:

a plurality of input terminals for receiving data from predetermined other stations of said system;

a plurality of output terminals for transmitting data to said other stations; and

a data transceiver unit, including

means for transmitting data generated by the station in which said apparatus is being used to all of said output terminals simultaneously,

means for receiving data from said input terminals including means for storing said received data internally, and simultaneously transmitting said received data to said output terminals except for an output terminal connected to the station from which said received data was transmitted, and

priority decision means for detecting data received at said input terminals and enabling said means for receiving to store and simultaneously transmit only the earliest received data.

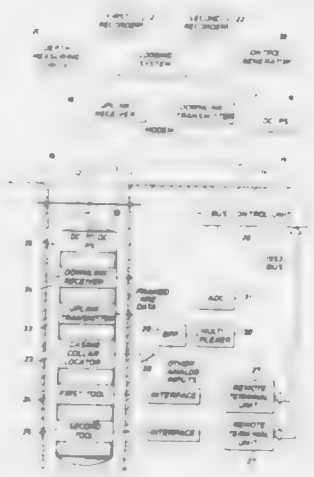
ADVANCED DIGITAL TELEMETRY SYSTEM FOR MONOCABLE TRANSMISSION FEATURING MULTILEVEL CORRELATIVE CODING AND ADAPTIVE TRANSVERSAL FILTER EQUALIZER

Wallace R. Gardner, Houston; Kenneth R. Goodman; Robert D. Puckett, both of LaPorte, and Ricky L. Draehn, Houston, all of Tex., assignors to Halliburton Logging Services, Inc., Houston, Tex.

Filed May 17, 1989, Ser. No. 353,278

Int. Cl.[5] **G01V** *1/00*



U.S. Cl. 340—856 **24 Claims**

1. A telemetry system for use in transfer of a data system from a sonde in a well borehole to the surface via an armored monocable having defined electrical characteristics of impedance, capacitance and inductance and the system includes a sonde supported uplink transmitter, comprising:

(a) a bus control unit in a sonde having an input data bus for receiving data from at least on tool supported inn the sonde wherein the tool data is required at the surface;

(b) means connected to said bus control unit for receiving a flow of data therefrom, said means encoding the data to form a duobinary encoded stream of data symbols wherein each data symbol represents an input data state and also correlates to another data state;

(c) modulator means forming a carrier signal, said means provided with said duobinary symbol to form an output data stream modulated on the carrier signal wherein the carrier signal has a specified carrier frequency, and further wherein the carrier signal is centered at a specified and width for subsequent transmission and further wherein

each data symbol is encoded with a positive carrier peak value and each symbol is also encoded with a negative and adjacent carrier peak;

(d) output driver means provided with the modulated carrier signal and having an analog output connected to the monocable deployed as a logging cable extending from the sonde to the surface andd wherein the monocable has a specified band width within limits in part determined by the electrical characteristics of t he monocable in use; and

(e) wherein said carrier frequency is centered in a band width determined by the characteristics of the monocable driven by the output means and further wherein the modulated duobinary signal placed thereon is frequency limited to fit within the band width.

HIGH RESOLUTION D/A CONVERTER OPERABLE WITH SINGLE SUPPLY VOLTAGE

Shinichi Hisano, Boston, Mass.; Apparajan Ganesan, Salem, N.H., and Thomas S. Guy, Andover, Mass., assignors to Analog Devices, Incorporated, Norwood, Mass.

Filed Mar. 15, 1990, Ser. No. 493,997
Int. Cl.[5] H03M *1/78*
U.S. Cl. 341—154 **8 Claims**

1 A high-resolution D/A converter integrated on an IC chip and operable with a relatively low single-supply voltage, said converter comprising:

a current-steering network having a plurality of matched current-source cells each comprising a bipolar current-source transistor;

means responsive to a multi-bit input signal for turning said current-source cells on or off, with the resultant current being steered to an output line;

resistor means connected to said current-source cells and including an R/2R network for at least a selected group thereof,

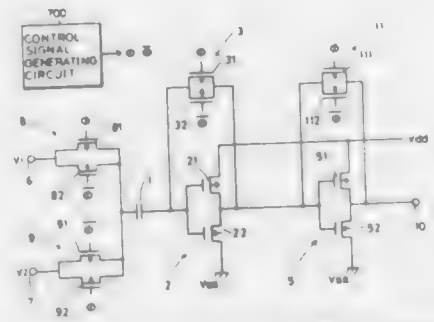
a voltage reference to be powered by said single supply voltage and operable to produce a stable reference voltage on an output line;

a control amplifier receiving a voltage corresponding to said reference voltage and arranged to produce a control signal;

means connecting said control signal to said current-source cells to set the level of the currents therefrom;

an output operational amplifier having first and second input terminals;

means supplying to said first input terminal a voltage proportional to said corresponding voltage; and



means coupling said second input terminal to a signal derived from the output of said current-steering network.

COMPARATOR CIRCUIT AND ANALOG TO DIGITAL CONVERTER

Takahiro Miki, and Shiro Hosotani, both of Hyogo, Japan, assignors to Mitsubishi Denki Kabushiki Kaisha, Tokyo, Japan

Filed Oct. 18, 1988, Ser. No. 260,126
Claims priority, application Japan, Oct. 19, 1987, 62-264159
Int. Cl.[5] H03K *5/24*, **H03M** *1/36*
U.S. Cl. 341—159 **13 Claims**

1. A comparator circuit for comparing first and second input voltages comprising:

first input means for receiving said first input voltage,

second input means for receiving said second input voltage,

capacitor means having first and second electrodes;

first switching means connected between said first input means and said first electrode of said capacitor means;

second switching means connected between said second input means and said first electrode of said capacitor means;

first inverter means having an input connected to said second electrode of said capacitor means;

third switching means connected across said first inverter means;

second inverter means having an input conductively connected to the output of said first inverter means;

fourth switching means connected across said second inverter means;

timing control means connected to said first, second, third and fourth switching means for controlling the switching operations thereof such that said first, third and fourth switching means are turned on whereas said second switching means is turned off at a first timing, and said first, third and fourth switching means are turned off whereas said second switching means is turned on at a second timing later than said first timing

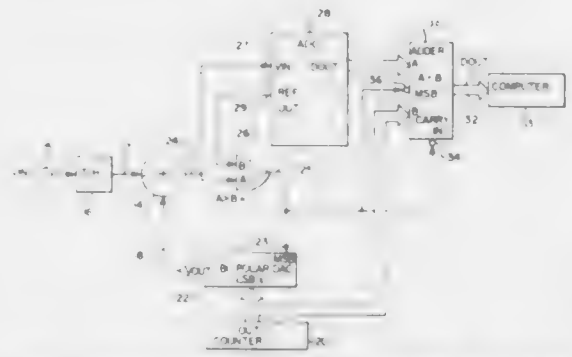
ULTRA LINEAR SPECTROSCOPIC ANALOG-TO-DIGITAL CONVERTER

David A. Giangano, Elmhurst; Martin Kesselman, Commack; Steven Bocskor, Ronkonkoma, and Anthony R. Celona, Northport, all of N.Y., assignors to Grumman Aerospace Corporation, Bethpage, N.Y.

Filed Apr. 2, 1990, Ser. No. 502,746
Int. Cl.[5] H03M *1/34*
U.S. Cl. 341—164 **9 Claims**

1. In an analog-to-digital converter (ADC) network having means for generating a variable analog count for summing with

an analog input signal, the result of which is converted to a digital number by an ADC, the variable count being subtracted thereafter for a final digital output, the improvement comprising:



bi-polar digital-to-analog converter (DAC) means connected between a digital number generator which generates the variable count and a first input of a summing means;

means for sampling the input signal;

means for connecting the sampled input signal to a second input of the summing means;

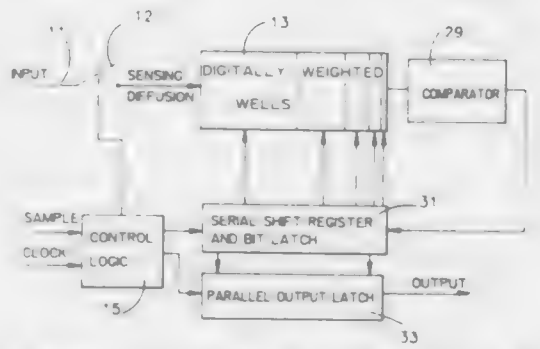
a comparator;

means connecting a full scale reference voltage of the ADC to a first input of the comparator;

means connecting the output of the summing means to a second input of the comparator to obtain a comparison;

the bi-polar DAC having a most significant bit (MSB) input connected to the output of the comparator for setting the MSB of the DAC when the comparison indicates the full scale of the ADC is exceeded;

wherein first and second inputs of the summing means are subtracted thereby producing a comparator input within range for the ADC; and



means connected to the output of the ADC and the number generator for separating the variable count from the output of the DAC thereby reconstructing the digitally converted analog input signal.

5,010,340

CHARGE DOMAIN SUCCESSIVE APPROXIMATION ANALOG TO DIGITAL CONVERTER

Paul E. Green, La Mirada, Calif., assignor to Rockwell International Corporation, El Segundo, Calif.

Filed Mar. 26, 1990, Ser. No. 498,788
Int. Cl.[5] H03M *1/38*
U.S. Cl. 341—172 **18 Claims**

1 A method of converting an analog signal to a digital representation comprising first through Nth bits, with the first bit being the most significant bit, the digital representation including a kth bit, the method comprising:

(a) setting first through Nth charge storage gates, including a kth gate, in a charge accept mode, wherein each of said charge storage gates has a charge accept mode and a charge expel mode.,

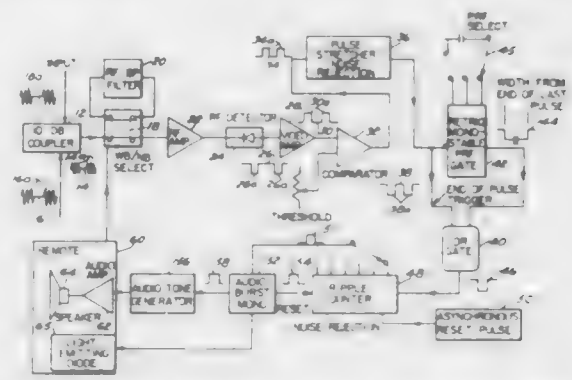
(b) receiving a charge packet representative of a signal amplitude;

(c) storing said charge packet proportionately in said gates;

(d) setting said kth gate in the charge expel mode and expelling the charge from said kth gate onto a sensing diffusion connected to said gates and onto others of said gates;

(e) detecting whether said sensing diffusion is in a first condition or a second condition;

(f) if said sensing diffusion is in said first condition, recording a "0" for the kth bit of said digital representation, and holding said kth gate in said charge expel mode; and



(g) if said sensing diffusion is in said second condition, recording a "1" for the kth bit of said digital representation and resetting said kth gate to said charge accept mode.

5,010,341

HIGH PULSE REPETITION FREQUENCY RADAR EARLY WARNING RECEIVER

William P. Huntley, Old Lyme, and David J. Swanick, Salem, both of Conn., assignors to The United States of America as represented by the Secretary of the Navy, Washington, D.C.

Filed Oct. 4, 1989, Ser. No. 417,616
Int. Cl.[5] G01S *13/04*
U.S. Cl. 342—20 **5 Claims**

1. A high pulse repetition frequency radar early warning receiver comprising:

coupler means for receiving an input signal and transmitting an attenuated version of said input signal;

wideband/narrow band select switch means connected for receiving said attenuated signal, selecting a portion of said attenuated signal and transmitting said selected portion of said attenuated signal;

RF detector means connected to receive said selected portion of said signal, amplitude detecting said selected portion of said signal, and transmitting the amplitude detected signal;

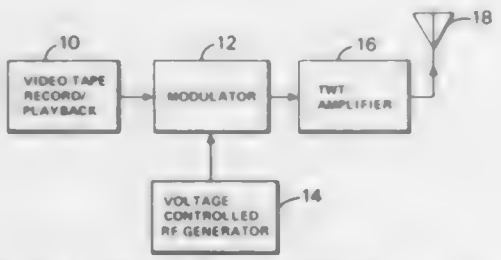
comparator means connected to said RF detector for receiving said amplitude detected signal and for generating digital pulses when said amplitude detected signal exceeds a predetermined magnitude;

pulse stretching means connected to said comparator for receiving said digital pulses, lengthening the time frame of the received pulses, and transmitting the lengthened pulses;

pulse repetition frequency determining circuit means connected to said pulse stretcher for receiving said lengthened pulses and for generating output pulses when the frequency of the lengthened pulses exceeds a predetermined frequency;

counting circuit means connected to said pulse repetition frequency determining circuit means for receiving said generated output pulses and for generating an output signal when the number of received pulses exceeds a

predetermined value within a predetermined period of time; and



signal means connected to said counting circuit for receiving said generated output signal and for generating at least one of an audio and visual signal upon receipt of said generated output signal.

METHOD AND DEVICE IN THE ANTENNA AND RECEIVING SYSTEM OF A RADIO THEODOLITE

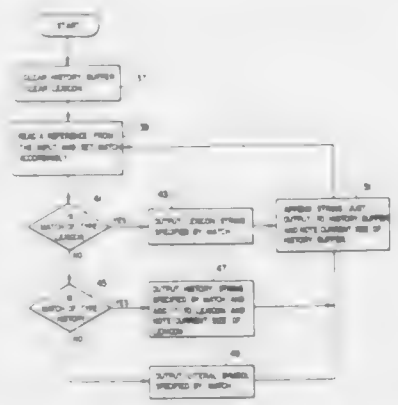
Heary Andersson, Espoo, Finland, assignor to Vaisala Oy, Finland

Filed Apr. 25, 1989, Ser. No. 352,836
Claims priority, application Finland, Apr. 26, 1988, 881956
Int. Cl.[5] G01S 5/04
U.S. Cl. 342—432 4 Claims

1. Radio theodolite apparatus for measuring a radio signal arriving from a transmitter comprising:

an antenna system including at least three antennas (1 . . . n − 1), in an antenna field (AK), which includes an inner reference antenna (n) as well as an antenna selection unit (10a), receiver devices (11), phase-measurement devices (17), amplitude-measurement devices, and control and measurement device(60);

a reference antenna (n + 1) not belonging to the antenna field (AK) and a related receiver device (12) connected to the antenna system, whereby the phases of the signals of all the antennas (1 . . . n) belonging to the antenna field can be measured in relation to the reference signal obtained into said receiver device (12); and



the outer reference antenna (n + 1) is placed at a distance larger than two wavelengths (λ) from the nearest other antenna (1 n).

5,010,344

METHOD OF DECODING COMPRESSED DATA

Michael E. Nagy, Tampa, Fla., assignor to International Business Machines Corporation, Armonk, N.Y.

Filed Dec. 28, 1989, Ser. No. 458,117
Int. Cl.[5] H03M 7/40
U.S. Cl. 341—65 2 Claims

2. A method of decoding a compressed free-form data stream made up of a sequence of literal references, lexicon references and history references, which comprises the steps of:

a) reading the first bit of said sequence;

b) reading the next eight bits of said sequence and emitting the symbol represented by said eight bits if said first bit is a zero;

c) inserting the symbol emitted in step b) in a history buffer,

d) noting the current size of said history buffer;

e) reading the second bit of said sequence if said first bit is a one;

f) if said second bit is a zero, reading the next number of bits of said sequence equal to the base two logarithm, rounded up to the nearest integer, of said current size of said history buffer, said number of bits identifying an offset into said history buffer, then reading the next number of bits of said sequence equal to the base two logarithm, rounded up to the nearest integer, of a preselected maximum history reference length, said number of bits identifying a length of a symbol string in said history buffer, and then emitting the string of symbols from said history buffer identified by said offset and length values;

g) inserting the string emitted in step f) in said history buffer;

h) noting the current size of said history buffer;

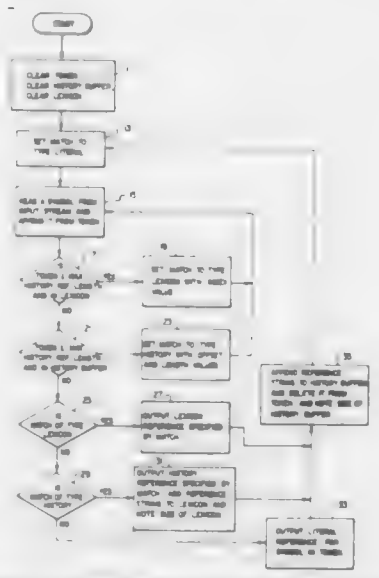
i) inserting the string emitted in step f) in a lexicon;

j) noting the current size of said lexicon;

k) if said second bit is a one, reading the next number of bits from said sequence equal to the base two logarithm, rounded up to the nearest integer, of said current size of said lexicon, said number of bits representing an index into said lexicon, and emitting the string of symbols from said lexicon identified by said index;

l) inserting the string emitted in step k) in said history buffer;

m) noting the current size of said history buffer; and



n) repeating steps a) through m) until said sequence is exhausted.

DATA COMPRESSION METHOD

Michael E. Nagy, Tampa, Fla., assignor to International Business Machines Corporation, Armonk, N.Y.

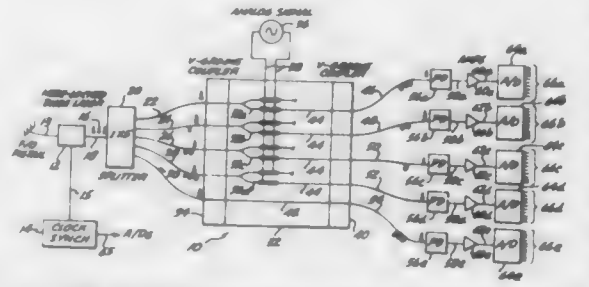
Filed Dec. 28, 1989, Ser. No. 458,119
Int. Cl.[5] H03M 7/40
U.S. Cl. 341—65 15 Claims

1 A method of compressing data made up of a sequence of symbols, which comprises the steps of:

recording in a fixed length history buffer symbols of said sequence;

emitting a history reference whenever a string of symbols from said sequence is duplicated in said history buffer;

recording in a lexicon strings of symbols that have been emitted by means of history references; and,



emitting a lexicon reference whenever a string of symbols from said sequence is duplicated in said lexicon.

ELECTRO-OPTICAL ANALOG-TO-DIGITAL CONVERTER AND METHOD FOR DIGITIZING AN ANALOG SIGNAL

Michael C. Hamilton, and John A. Bell, both of Redmond, Wash., assignors to The Boeing Company, Seattle, Wash.

Filed Oct. 27, 1989, Ser. No. 427,730
Int. Cl.[5] H03M 1/00
U.S. Cl. 341—137 24 Claims

1. A high speed, electro-optical analog-to-digital converter, for digitizing an analog signal, comprising:

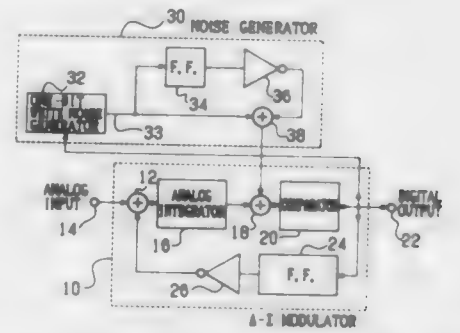
(a) clock means for producing synchronization signals;

(b) light source means, connected to receive the synchronization signals and operative to produce pulses of light in response thereto;

(c) modulator means for modulating an intensity of the pulses of light as a function of an amplitude of the analog signal and thereby producing modulated light pulses, light pulses entering the modulator means at successively different times being modulated in response to the amplitude of the analog signal at those different times;

(d) demultiplexing means, for demultiplexing the light pulses produced by the light source means;

(e) detector means, connected to receive light pulses that have been demultiplexed by the demultiplexing means and modulated by the modulating means, for producing electrical signals having a magnitude proportional to the intensity of said light pulses; and



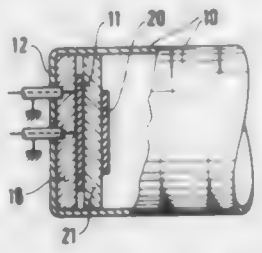
(f) a plurality of electrical analog-to-digital converters, each connected to receive a different one of the electrical signals and to receive the synchronization signals produced by the clock means, for producing digital data that vary as a function of the magnitude of said electrical signals, said digital data produced thereby corresponding to the amplitude of the analog signal at the different times.

5,010,347

ANALOG-TO-DIGITAL CONVERTER HAVING AN EXCELLENT SIGNAL-TO-NOISE RATIO FOR SMALL SIGNALS

Akira Yukawa, Tokyo, Japan, assignor to NEC Corporation, Tokyo, Japan

Filed Sep. 26, 1988, Ser. No. 249,158
Claims priority, application Japan, Sep. 25, 1987, 62-24141; Sep. 25, 1987, 62-24142; Oct. 1, 1987, 62-249228
Int. Cl.[5] H03M 3/00
U.S. Cl. 341—143 8 Claims



1. An oversampled analog-to-digital converter which includes an analog-to-digital converting circuit having at least an analog signal input terminal, an adder means having a first input connected to the analog signal input terminal and a second input, and a comparator having an input coupled to receive an output of the adder means and operating to generate a digital signal at a given sampling frequency, this digital signal being applied to the second input of the adder means, wherein the improvement comprises a noise generator including a one-bit white noise generator connected to receive the digital signal outputted from the comparator for generating a one-bit white noise signal, and means coupled to the one-bit white noise generator for outputting a signal indicative of a difference between values of two white noise signals at two continuous sampling points, this difference signal being added to the input of the comparator, wherein said digital signal is generated without subtracting said one-bit white noise signal therefrom.

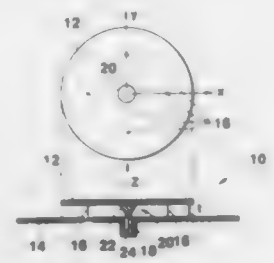
DEVICE FOR EXCITING A WAVEGUIDE WITH CIRCULAR POLARIZATION FROM A PLANE ANTENNA

Didier Rene, Toulouse; Thierry Dusseux, Colombes, and Philippe Ginestet, Toulouse, all of France, assignors to Alcatel Espace, Courbevoie, France

Filed Nov. 7, 1988, Ser. No. 268,302
Claims priority, application France, Nov. 5, 1987, 87 15359
Int. Cl.[5] H01Q 1/38
U.S. Cl. 343—700 MS 7 Claims



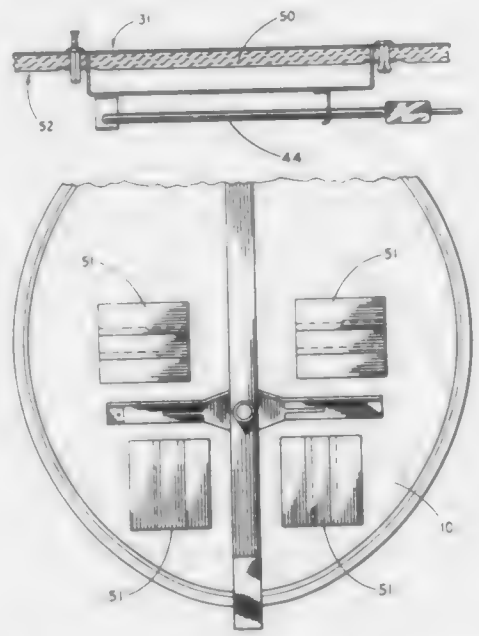
1 A device for exciting a rectinlinear hollow waveguide having an axis of symmetry and being closed at a first end perpendicular to said axis of symmetry; said device comprising: a plane antenna comprising a ground plane constituted by said first end of the waveguide; at least two dielectric layers, separated by a first metallic surface, and disposed on the interior surface of said waveguide first end; the dielectric layer of said layers remote from said waveguide first end having a second metallic surface disposed thereon, said dielectric layers and said metallic surfaces all being disposed symmetrically with respect to the axis of symmetry of the waveguide, and wherein said metallic surfaces each form a radiating element and constitute a plurality of superposed resonators disposed on the interior surface of said waveguide first end, at least one pair of coaxial lines connected to said first metallic surface, circumferentially spaced from each other by 90° relative to the axis of symmetry of the waveguide and a circuit including a hybrid coupler feeding said coaxial line in quadrature for exciting the waveguide with circular polarization.

5,010,349

PLANE PATCH ANTENNA

Tsuyoshi Mizuno, Yokosuka, and Motoki Hirano, Yokohama, both of Japan, assignors to Nissan Motor Company, Ltd., Yokohama, Japan

Filed Mar. 16, 1990, Ser. No. 494,343
Claims priority, application Japan, Apr. 12, 1989, 1-90681
Int. Cl.[5] H01Q 1/36
U.S. Cl. 343—700 MS 6 Claims



1. A plane patch antenna comprising:
a patch conductive plate member;
an earth conductive plate member;
a plurality of short pins extending between the patch and earth plane members to maintain the patch and earth plate members in spaced-parallel relation to each other and to make electric connection between the patch and earth plate members; and
a feeder shaft extending from the patch plate member for electrical connection of the patch plate member to a lead wire, the feeder shaft having a tapered portion extending from the patch plate member toward the earth plate member, the tapered portion having a cross-sectional area decreasing as going away from the patch plate member, the tapered portion having a maximum diameter in its area of attachment to the patch plate member, the maximum diameter being in a range of 0.12λ to 0.18λ.

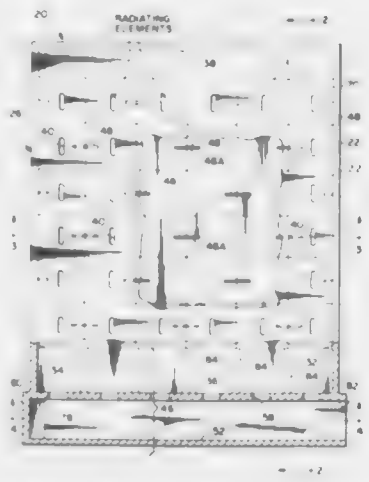
ANTI-ICING AND DE-ICING SYSTEM FOR REFLECTOR-TYPE MICROWAVE ANTENNAS

Charles L. Lipkin, Naperville, and Marianne Jones, Lockport, both of Ill., assignors to Andrew Corporation, Orland Park, Ill.

Continuation-in-part of Ser. No. 130,809, Nov. 25, 1987, abandoned. This application Oct. 13, 1989, Ser. No. 421,173
Int. Cl.[5] H01Q 1/02
U.S. Cl. 343—704 11 Claims



1 An anti-icing and de-icing system for a reflector-type microwave antenna having a paraboloidal reflector for launching and receiving microwave signals, said system comprising
a thermally non-conductive enclosure forming an enclosed cavity adjacent the rear surface of said reflector,
radiant heating means within said enclosure for heating the rear surface of said reflector with radiant energy emanating in a range of directions from said heating means in such a way that the air in said cavity is in turn heated by heat transferred to said air from the rear surface of said reflector, and
means within said enclosure for directing the radiating energy emanating from said heating to said rear surface of said paraboloidal reflector,
said heating means having a front side facing said rear surface of said flector and said directing means further comprising means for diverting at least a portion of the radiant energy emanating from said front side of said heating source and dispersed said diverted energy across the rear surface of said paraboloidal reflector.

5,010,351

SLOT RADIATOR ASSEMBLY WITH VANE TUNING

Kenneth C. Kelly, Sherman Oaks, Calif., assignor to Hughes Aircraft Company, Los Angeles, Calif.

Filed Feb. 8, 1990, Ser. No. 477,089
Int. Cl.[5] H01Q 13/10
U.S. Cl. 343—771 10 Claims

1. An array antenna, comprising:
a hollow waveguide of rectangular cross-section having first and second opposed broadwalls, and first and second opposed sidewalls, joined together along their respective longitudinal edges, said broadwalls and said sidewalls being comprised of conductive material to thereby render said waveguide capable of supporting the propagation of an electromagnetic wave through said waveguide, along the longitudinal dimension thereof;
a matrix of radiating slots provided in said first broadwall, said matrix being defined by a plurality M of rows of said slots, and a plurality N of columns of said slots, with each of said slots being oriented with its longitudinal dimension substantially parallel to the longitudinal dimension of said waveguide;
a plurality of vanes provided on said second broadwall and extending only partially across the internal height dimension of said waveguide, said vanes being configured with relation to each said column of slots in an alternating pattern such that successive ones of said vanes corresponding to successive rows of a column are located on opposite sides of said slots occupying said successive rows of that column;
wherein said vanes each lie in a plane disposed transverse to said sidewalls of said waveguide;
wherein the width of said broadwalls is at least N times greater than the height of said sidewalls; and,
wherein said vanes function to provide a sinuous path of propagation of said electromagnetic wave along each said column of slots so as to enhance coupling of said electromagnetic wave through said slots.

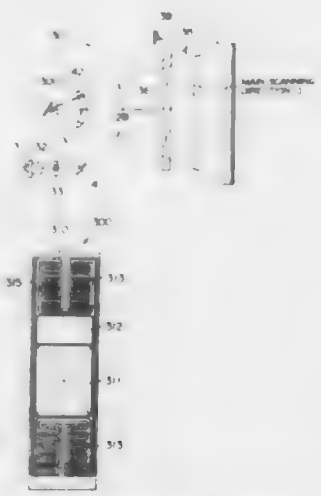
THERMAL TRANSFER INK PRINTING APPARATUS

Katsumori Takei; Hitoshi Fukushima; Kohei Iwamoto, and Hiroto Nakamura, all of Nagano, Japan, assignors to Seiko Epson Corporation, Tokyo, Japan

Division of Ser. No. 104,139, Oct. 5, 1987, Pat. No. 4,914,079. This application Jan. 19, 1990, Ser. No. 467,114
Claims priority, application Japan, Oct. 6, 1986, 61-237482
Int. Cl.[5] G01D 15/10; B41J 2/315
U.S. Cl. 346—76 PH 6 Claims

1 A thermal transfer printing apparatus adapted for forming an image on a recording medium with a thermal transfer ink medium having at least a heat resistant support layer, a thermal ink layer thereon and an ink transfer layer on the ink layer, comprising:
a thermal print head for selectively applying thermal energy to the thermal transfer ink medium in a selected pattern corresponding to a desired image;
first platen means disposed opposite to the print head with the thermal transfer ink medium and not the recording medium therebetween for cooperating with the print head for contacting the thermal transfer ink medium to the print head for transferring the thermal energy from the



printing head to selectively heat the ink layer for transfer of selected portions of the ink layer to the ink transfer layer; and
second platen means for contacting the ink transfer layer leaving a position between the print head and the first platen means to the recording medium and for separating the support layer and unselected ink portions from the ink transfer layer and selected ink portions and for adhering the ink transfer layer and selected ink portions to the recording medium.

a beam correcting lens system interposed between said deflector and a recording medium so that said laser beam, deflected by said deflector, scans said recording medium through said lens system to write in said image signal,

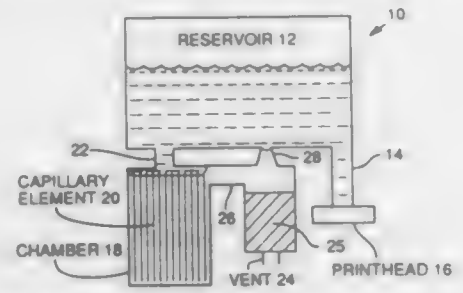
wherein said deflecting element is molded integrally of a frame, a reflecting mirror, a drive coil and a ligament, and said deflector is driven at or near a natural frequency of said deflecting element, and

a length D in the main scanning direction at a laser beam reflecting surface of said reflecting mirror is selected to comply with the following formula,

$$D \geq 1.64 \times (\lambda F/d \cos(\alpha/2) + \alpha/2)$$

wherein λ is a wavelength of laser beam, F is a focal length of a lens for scanning, d is a diameter of laser beam in the main scanning direction on the recording medium, and α is an angle of incident beam to the reflecting mirror with respect to an optical axis of reflecting beam.

5,010,354



INK JET PEN WITH IMPROVED VOLUMETRIC EFFICIENCY

Bruce Cowger; John H. Dion, and William E. Peters, all of Corvallis, Oreg., assignors to Hewlett-Packard Company, Palo Alto, Calif.

Filed Nov. 28, 1989, Ser. No. 442,746

Int. Cl.[5] B41J *2/175*

U.S. Cl. 346—140 R **16 Claims**

1. An ink jet pen, comprising:

an ink reservoir for supplying ink to a printhead;

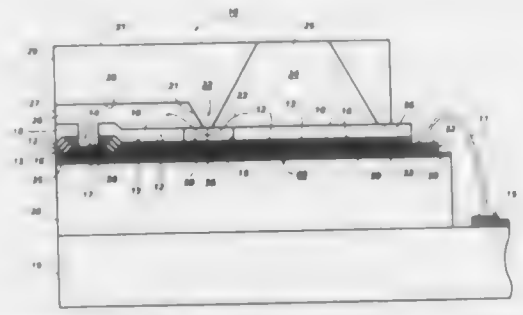
a chamber adjacent to the ink reservoir; and

capillary volume means contained within the chamber comprising a plurality of spaced plates, the capillary means being in fluid communication with the ink reservoir for maintaining pressure at the printhead at less than ambient pressure, the capillary means supplying ink to and accepting ink from the reservoir in response to a change in pressure within the reservoir.

5,010,355

INK JET PRINTHEAD HAVING IONIC PASSIVATION OF ELECTRICAL CIRCUITRY

William G. Hawkins, Webster; Cathie J. Burke, Rochester; Daniel O. Roll, Fishers; Pamela J. Hartman, Hilton, and Diane Atkinson, Marion, all of N.Y., assignors to Xerox Corporation, Stamford, Conn.



Filed Dec. 26, 1989, Ser. No. 456,431

Int. Cl.[5] B41J *2/34;* **H01L** *21/00*

U.S. Cl. 346—140 R **6 Claims**

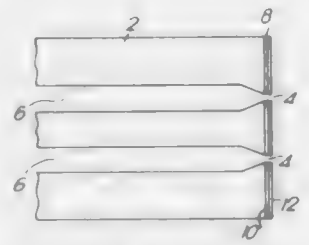
1. An improved ink jet printhead having a plurality of parallel ink flow channels, each of which terminate with an ink droplet emitting nozzle at one end and communicate with an ink supplying reservoir at the other end, a heating element with a cavitational protective layer thereover being located in each channel a predetermined distance upstream from the nozzle, and MOS electronic circuitry monolithically integrated within the printhead for applying electrical pulses to the heating elements to produce bubbles momentarily on the protective layer of the heating element in response thereto, each of said bubbles expelling an ink droplet from the nozzles, wherein the improvement comprises:

ionic passivation of the MOS electronic circuitry through the deposition of a multi-layered, thin film insulative coating thereon consisting of a first layer of doped or undoped silicon dioxide directly over the MOS electronic circuitry and heating elements with protective layer having a thickness of 200 Å to 2 μm followed by a second layer of plasma nitride over the first layer having a thickness of 1000 Å to 3 μm, the silicon nitride being dry etched over the protective layer of the heating elements and electrical

contact pads for external connection to electrical power to expose the first layer of silicon oxide, followed by etching of the silicon oxide to remove it from the protective layer and contact pads, whereby the etch sequence prevents both contact pads and the heating element protective layers from being attacked, and the MOS circuitry is concurrently protected from mobile ions in the ink by said multi-layered, ionic passivation, while maintaining the cost effective fabrication of a printhead having heating elements with a cavitational protective layer to enhance their life time.

5,010,356

METHOD OF FORMING AN ADHERENT FLUOROSILANE LAYER ON A SUBSTRATE AND INK JET RECORDING HEAD CONTAINING SUCH A LAYER



Rosemary B. Albinson, London, England, assignor to XAAR Limited, England

Filed Oct. 2, 1989, Ser. No. 415,726

Claims priority, application United Kingdom, Oct. 19, 1988, 8824436; Mar. 20, 1989, 8906380

Int. Cl.[5] G01D *15/18;* **B05D** *5/08, 7/24*

U.S. Cl. 346—140 R **38 Claims**

1. A method of reducing the wettability of a surface comprising plastic or non-vitreous inorganic material by providing an adherent coating of fluorosilane on said surface, said method comprising the steps of:

(a) forming on said surface an adherent first layer comprising cured siloxane; and

(b) applying to said first layer a second layer comprising at least one fluorosilane having a silicon atom to which is attached at least one hydrolyzable group and at least one fluorine-containing organic group which donates non-wetting properties to said second layer.

26. An ink jet recording head of the type in which ink droplets are jetted from a jet orifice of said head toward a recording material, said head defining a surface surrounding said jet orifice comprising plastic or non-vitreous inorganic material coated with a fluorosilane layer which reduces the wettability of said surface, with a layer comprising cured siloxane which is adherent to said surface interposed between said surface and said fluorosilane layer, said fluorosilane layer being derived from at least one fluorosilane having at least one hydrolyzable group attached to a silicon atom.

1. An apparatus for an automatic exposure camera for effecting photometry of a plurality of small areas in the image field of an object being photographed, comprising:

a taking lens for focussing an image of the object being photographed upon a surface in said camera;

a single photometric element provided in the camera and positioned relative to said surface for determining the brightness of a relatively small area of the image field of the object created at said surface;

a viewfinder on the camera cooperating with said taking lens enabling the operator to view the image field;

a switch for activating said single photometric element upon each operation of the switch which is activated each time a predeterrmined desired area of an image field is aligned with said single photometric element through the aid of said viewfinder to obtain a photometric value at the selected small area;

memory means in said camera for storing a plurality of successive photometric values obtained from said single photometric element each time said switch is operated, said values indicating the brightness of said predetermined desired area with which said single photometric element is aligned;

calculation means responsive to operation of said switch for performing a calculation utilizing the plurality of photometric values stored in said stored means and the number of photometric values stored to derive a calculation value;

exposure control means responsive to values of film speed and either an aperture setting or a shutter speed setting

preset into said camera for controlling an exposure of said camera in accordance with said preset values and said calculation value, upon initiation of a photographing operation.

IMAGE FORMING APPARATUS

Takemi Yamamoto; Osamu Nagata; Ryohei Komiya; Jun Sakai, and Yoshiyuki Ban, all of Nagoya, Japan, assignors to Brother Kogyo Kabushiki Kaisha, Nagoya, Japan

Filed Sep. 27, 1990, Ser. No. 589,095

Int. Cl.[5] G03B *27/72*

U.S. Cl. 355—20 **5 Claims**

1. An image forming apparatus for forming an image on a sheet by using a cathode ray tube as a light source which comprises;

(a) a cathode ray tube for selectively emitting light signals onto a photosensitive pressure-sensitive sheet or heat-developing color silver chloride sheet;

(b) a first sheet accommodating portion for accommodating a plurality of developing sheets cooperating with the photosensitive pressure-sensitive sheet;

(c) a second sheet accommodating portion for accommodating a plurarity of silver chloride sheets;

(d) a transferring mechanism for transferring the photosensitive pressure-sensitive sheet so as to form an exposing portion located opposite to the cathode ray tube, the silver chloride sheet being selectively portioned at the exposing portion;

(e) a pressure developing unit disposed along a transferring path of the photosensitive pressure-sensitive sheet for transferring a latent image formed on the photosensitive pressure-sensitive sheet onto the developing sheet fed from the first sheet accommodating portion;

(f) a heat-fixing unit for fixing an image on the developing sheet or the silver chloride sheet; and

(g) a controlling circuit for controlling the cathode ray tube, which comprises an image signal inverting means for inverting a polarity of an image signal so as to invert light and darkness of an image formed on the cathode ray tube and/or a deflecting circuit for inverting an image formed on the cathode ray tube in a mirror image relationship.

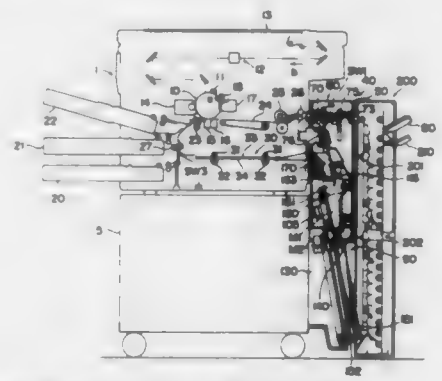
IMAGE FORMING APPARATUS HAVING SHEET JAM REACTION RESET MEANS



Kimihiko Higashio, Osaka, and Takeshi Yoshikai, Minokamo, both of Japan, assignors to Minolta Camera Kabushiki Kaisha, Osaka, Japan

Filed Dec. 29, 1989, Ser. No. 459,122

Claims priority, application Japan, Dec. 30, 1988, 63-333169; Dec. 30, 1988, 63-333171

Int. Cl.[5] G03G *15/00*

U.S. Cl. 355—206 **5 Claims**

1. An image forming apparatus comprising:

an image forming section where an image is formed on a sheet;

a sheet handling section for receiving printed sheets from the image forming section, said sheet handling section being operable in an ejection mode of ejecting printed sheets outside and in a mode of collecting printed sheets inside thereof to process the sheets;

means provided in the sheet handling section for detecting a sheet, which means is disposed in a sheet path taking sheets outside said sheet handling section;

means for detecting the occurrence of a sheet jam at each part in the sheet handling section;

means for reacting to a sheet jam by discontinuing the operation of the apparatus in response to a jam signal generated from the sheet jam detecting means; and

means for resetting the sheet jam reaction, when the apparatus is relieved of the sheet jam, by canceling the discontinuance of the operation of the apparatus in accordance with the operation mode in which the sheet handling section was operated before the discontinuance,

wherein when the operation mode of the sheet handling section before the discontinuance is the ejection mode, the jam reaction resetting operation is executed in response to a signal indicating that the sheet detecting means does not detect a sheet after the jam reacting operation.

SLIDE TRANSPARENCY PROJECTOR APPARATUS FOR USE WITH AN ELECTROPHOTOGRAPHIC REPRODUCTION MACHINE

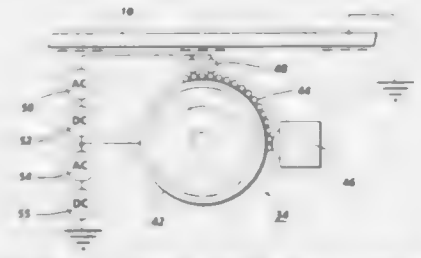
Carlton J. Baxter, Penfield, N.Y., assignor to Eastman Kodak Company, Rochester, N.Y.

Filed Jun. 15, 1989, Ser. No. 366,396
Int. Cl.[5] G03G *15/04*
U.S. Cl. 355—240 **9 Claims**

1 For use with an electrophotographic reproduction machine including a transparent platen for supporting information to be reproduced, means for exposing information located on said transparent platen, a photoconductive member upon which latent image charge patterns of such information are formed, and a main lens assembly for projecting focused image of information on said transparent platen onto said photoconductive member to form such latent image charge patterns, apparatus for enabling said electrophotographic reproduction machine to make reproductions of slide transparencies, said apparatus comprising:

means for projecting a real image of a slide transparency along an optical path onto said transparent platen;

a Fresnel lens; and



means for supporting said Fresnel lens in said optical path of said projecting means as a field lens for said main lens assembly, said supporting means maintaining said Fresnel lens in spaced relation to said transparent platen beyond the depth of focus of said main lens assembly.

DUAL AC DEVELOPMENT SYSTEM FOR CONTROLLING THE SPACING OF A TONER CLOUD

Dan A. Hays, Fairport, N.Y., assignor to Xerox Corporation, Stamford, Conn.

Filed Dec. 11, 1989, Ser. No. 448,407
Int. Cl.[5] G03G *15/08*
U.S. Cl. 355—247 **32 Claims**

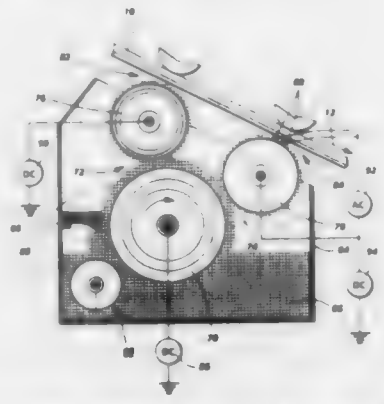
1. Apparatus for forming images on an image receiving surface with developer, said apparatus comprising:

a supply of developer;

means for transporting developer from said supply to an area adjacent said image receiving surface;

means for forming transported developer into a cloud of marking particles;

means for controlling the spacing of said marking particle cloud relative to said image receiver without interacting with said image receiving surface; and



means for establishing a development field between said transporting means and said image receiving surface for causing an image on said image receiving surface to be developed with marking particles.

5,010,368

MAGNETIC TRANSPORT ROLL FOR SUPPLYING TONER OR CARRIER AND TONER TO A DONOR AND MAGNETIC DEVELOPER ROLL RESPECTIVELY

John F. O'Brien, Penfield, N.Y., assignor to Xerox Corporation, Stamford, Conn.

Filed Feb. 20, 1990, Ser. No. 482,110
Int. Cl.[5] G03G *15/06*
U.S. Cl. 355—259 **3 Claims**

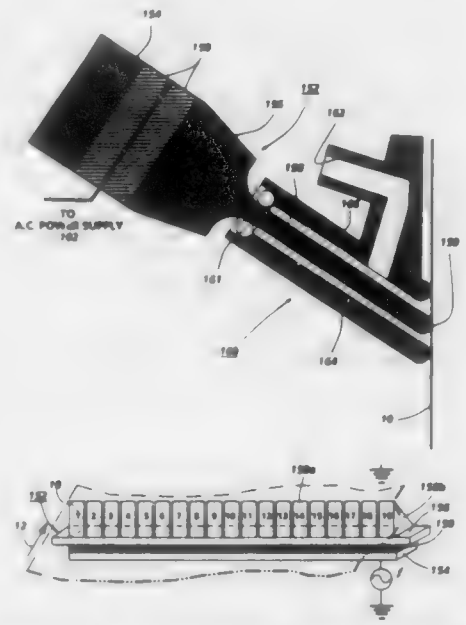
1. An electrophotographic printing machine of the type having an electrostatic latent image recorded on a photoconductive surface developed by toner to form a visible image thereof, wherein the improvement includes:

a housing defining a chamber adapted to store a supply of developer material comprising at least carrier and toner therein;

a donor roll positioned at least partially in the chamber of said housing, said donor roll being adapted to deliver toner to the surface to develop the latent image recorded thereon with toner;

a magnetic developer roll spaced from said donor roll and positioned at least partially in the chamber of said housing, said developer roll being adapted to deliver developer material to the surface to develop the latent image recorded thereon with toner;

a magnetic transport roll adapted to transport developer material to a first loading zone where a portion of the developer material is attracted to said magnetic developer roll with the remainder of the developer material being transported to a second loading zone where toner is attracted from carrier to said donor roll, and



an electrode member positioned in the space between the surface and said donor roll, said electrode member being closely spaced from said donor roll and being electrically biased to detach toner from said donor roll so as to form a toner cloud in the space between said electrode member and the surface with detached toner from the toner cloud developing the latent image.

5,010,369

SEGMENTED RESONATOR STRUCTURE HAVING A UNIFORM RESPONSE FOR ELECTROPHOTOGRAPHIC IMAGING

William J. Nowak, Webster; Anthony A. Attardi, Rochester, and Daniel W. Costanza, Webster, all of N.Y., assignors to Xerox Corporation, Stamford, Conn.

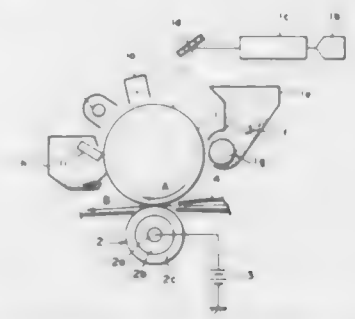
Filed Jul. 2, 1990, Ser. No. 548,517
Int. Cl.[5] G03G *15/14*
U.S. Cl. 355—273 **15 Claims**

1. In an imaging device having a non-rigid member with a charge retentive surface moving along an endless path, means for creating a latent image on the charge retentive surface, means for imagewise developing the latent image with toner, means for electrostatically transferring the developed toner image to a copy sheet, and a resonator for enhancing toner release from the charge retentive surface and producing relatively high frequency vibratory energy, and having a portion thereof adapted for contact across the flexible belt member, generally transverse to the direction of movement thereof, the resonator comprising:

a horn member for applying the high frequency vibratory energy to the belt member, having a platform portion, a horn portion, and a contacting portion;

vibratory energy producing means coupled to said horn platform, for generating the high frequency vibratory energy;

support means for supporting the combination of said vibratory energy producing means and said horn member;



said horn member divided into a plurality of horn segments across said belt member, each horn segment including horn portion and contacting portion in substantially non-contacting relationship with adjacent horn segments.

TRANSFER APPARATUS AND IMAGE BEARING APPARATUS USING SAME HAVING TRANSFER MEANS FOR CONTACTING A BACKSIDE OF A TRANSFER MATERIAL

Junji Araya, Yokohama; Yukihiro Ohzeki, Kashiwa; Toshio Miyamoto, Tokyo; Koichi Hiroshima, Yokohama; Yasushi Sato, and Kimio Nakahata, both of Kawasaki, all of Japan, assignors to Canon Kabushiki Kaisha, Tokyo, Japan

Filed Oct. 24, 1989, Ser. No. 426,002
Claims priority, application Japan, Oct. 29, 1988, 63-271990
Int. Cl.[5] G03G *15/16*
U.S. Cl. 355—274 **14 Claims**

1. An image forming apparatus, comprising:

an image bearing member;

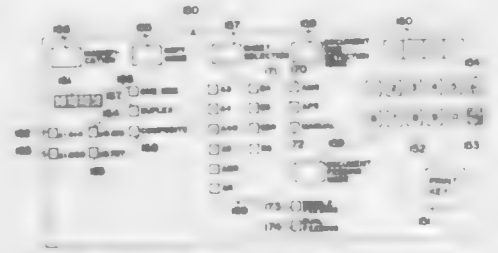
latent image forming means for forming an electrostatic latent image on said image bearing member;

developing means for developing an electrostatic latent image formed on said image bearing member into a toner image with toner;

transfer means for contacting a backside of the transfer material, for urging the transfer material to said image bearing member having the toner image and for applying a transfer bias to transfer the toner image to the transfer material;

wherein amounts of electric charge applied to the transfer material by said transfer means during a transfer operation satisfy the relation:

$$A \geq B/2$$



where A is an amount of the charge at a portion of the transfer material where the toner is present, and B is an amount of the charge at a portion of the transfer material where the toner is absent.

COPYING APPARATUS PROVIDED WITH AUTOMATIC DOCUMENT FEEDER

Hirokazu Matsuo, and Hiroyasu Nagato, both of Osaka, Japan, assignors to Minolta Camera Kabushiki Kaisha, Osaka, Japan

Continuation of Ser. No. 192,371, May 10, 1988, abandoned.
This application Jan. 23, 1990, Ser. No. 469,702
Claims priority, application Japan, May 12, 1987, 62-115336; May 18, 1987, 62-121648; May 20, 1987, 62-124140; May 20, 1987, 62-124141; May 20, 1987, 62-124142; May 20, 1987, 62-124143
Int. Cl.[5] G03G 21/00
U.S. Cl. 355—313 11 Claims

1 A copying apparatus comprising

a rectangular platen,

transporting means for sequentially feeding first and second original documents and placing them on said platen side by side in the document feeding direction,

image forming means for copying the images of the documents placed side by side on said platen to a single surface of a copy sheet,

detecting means for detecting the size of a document fed by said transporting means, and

control means for inhibiting the operation of feeding the second document by said transporting means and allowing said image forming means to form the image of the first document, when the first document is placed on the platen with its longer side thereof in parallel to the longer side of said platen

BLACK-AND-WHITE AND COLOR COPIER OPERABLE AT DIFFERENT PROCESSING SPEEDS

Nobuo Kasahara; Masayoshi Watanuki, both of Yokohama; Satoru Maeno, Mie, and Masato Ohkuni, Ise, all of Japan, assignors to Ricoh Company, Ltd. and Shinko Electric Co., Ltd., both of Tokyo, Japan

Filed Aug. 28, 1989, Ser. No. 398,916
Claims priority, application Japan, Sep. 2, 1988, 63-220091
Int. Cl.[5] G03G 21/00
U.S. Cl. 355—313 6 Claims

1 A copying machine with a variable process speed having a black-and-white copying mode and color copying mode, comprising

a scanning optical system for optically scanning an original document, having color filters used in said color copying mode for decomposing color into red, green and blue;

a first drive unit for driving said scanning optical system,

a photosensitive means for obtaining a latent image of said original document, in association with said scanning optical system;

a second drive unit for driving said photosensitive means;

developer means for developing said latent image, having a black developer for developing said latent image obtained without said color filters in said black-and-white copying mode and a yellow developer, a magenta developer and a cyan developer for developing said latent image in respective complementary colors to red, green and blue in said color copying mode;

transfer means rotated in proximity to said photosensitive means and for transferring said developed latent image onto a transfer paper held on a transfer means to provide a copy of the original document,

a third drive unit for driving said transfer means,

a drive condition setting device for judging a designated copy mode and for giving speeds of said respective drive units varying in accordance with respective copy modes, having a pulse generating circuit for generating a series of pulses for controlling operations of said respective drive units, a frequency divider for dividing said series of pulses, and a frequency dividing ratio selecting means for selecting a frequency dividing ratio of said series of pulses to provide a series of divided pulses having a present frequency such that the speeds of the respective drive units are suitable for the designated copy mode, and

accelerating means for accelerating said speeds of said respective driving units in order to correct operating positions of said respective drive units, and having counter means for counting a given number of pulses generated by said pulse generating circuit, and an adder means for adding a counted value of said counter means to an output of said frequency divider

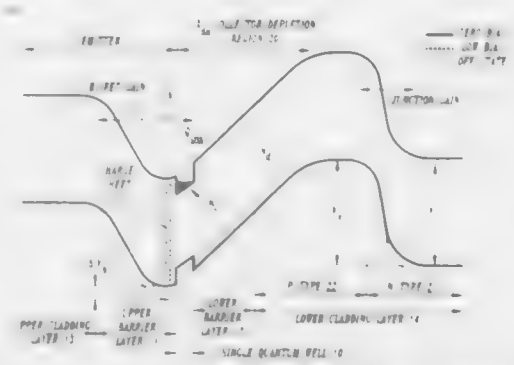
---

5,010,373

APPARATUS FOR SUPPLYING AND DISCHARGING ORIGINALS IN A COPYING MACHINE

Johannes L. J. M. Linssen, Baarlo, and Jozef J. A. Pleyers, Panningen, both of Netherlands, assignors to Oce Nederland B.V., Netherlands

Filed Jul. 10, 1990, Ser. No. 550,390
Claims priority, application Netherlands, Jul. 14, 1989, 8901828
Int. Cl.[5] G03G 21/00
U.S. Cl. 355—319 10 Claims



1 In an apparatus for supplying and discharging originals in a copying machine comprising a first cassette and a second cassette for originals, a first feed path for feeding originals from the first cassette to an imaging means of the copying machine and so formed that the originals are fed to the imaging means in a reversed orientation; a second feed path for feeding originals from the second cassette to the imaging means; a turnover path for turning over originals coming from the imaging means and returning them to the imaging means; a first discharge path for discharging originals from the imaging means to the first cassette and so formed that the originals are deposited in the first cassette in a reversed orientation, and a control means for controlling the transport of the originals; the improvement comprising the second feed path being so formed that the originals are fed to the imaging means in the same orientation as they had in the second cassette; a second discharge path is provided to discharge originals from the imaging means to the second cassette and is so formed that originals are deposited in the second cassette in the same orientation as they had when leaving the imaging means; and wherein the control means is so constructed that: (a) duplex originals, at least in the production of the first up to and including the penultimate set of copies, are fed from the cassette in which they are situated to the imaging means and, after both sides have been copied, are discharged to the other cassette, and (b) simplex originals, at least in the production of the second up to and including the last set of copies, are fed from the same cassette to the imaging means.

5,010,374

QUANTUM WELL LASER UTILIZING AN INVERSION LAYER

Paul W. Cooke, Fair Haven, and Geoffrey W. Taylor, Holmdel, both of N.J., assignors to AT&T Bell Laboratories, Murray Hill, N.J.

Filed Jun. 5, 1990, Ser. No. 533,549
Int. Cl.[5] H01L 29/161, 33/00; H01S 3/19
U.S. Cl. 357—16 9 Claims

1 In a laser comprising a quantum well region forming first and second heterojunction interfaces with upper and lower carrier confinement regions, respectively, the improvement comprising

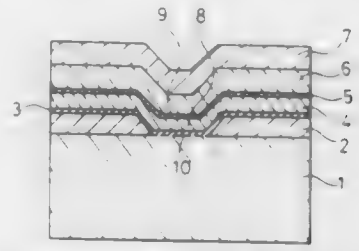
a charge sheet formed substantially near said first heterojunction interface and within said upper carrier confinement region such that an inversion layer is produced in said quantum well region, said quantum well region being substantially undoped, said upper and lower carrier confinement regions having a first conductivity type, said charge sheet having a second conductivity type opposite to said first conductivity type, and said charge sheet having a doping concentration sufficiently greater than said upper carrier confinement region for producing said inversion layer.

5,010,375

SEMICONDUCTOR LASER DEVICE

Yoshito Seiwa, Itami, Japan, assignor to Mitsubishi Denki Kabushiki Kaisha, Japan

Filed May 17, 1989, Ser. No. 353,029
Claims priority, application Japan, May 23, 1988, 63-126111
Int. Cl.[5] H01L 29/161
U.S. Cl. 357—16 5 Claims



1. A semiconductor laser device comprising:

a first conductivity type Si substrate;

a current confinement layer comprising a second conductivity type Si disposed on said substrate and having an aperture extending through said current confinement layer to said substrate;

a plurality of compound semiconductor layers including successively disposed lower cladding, active, and upper cladding layers comprising AlGaAs and GaAs disposed opposite said current confinement layer, opposite said Si substrate, and in said aperture in said current confinement layer forming a semiconductor laser; and

an AlGaAs buffer layer disposed between and in contact with said Si substrate and said plurality of compound semiconductor layers for relieving stress caused by the difference in lattice constants between said substrate and said plurality of compound semiconductor layers.

LIGHT EMITTING HETEROJUNCTION SEMICONDUCTOR DEVICE

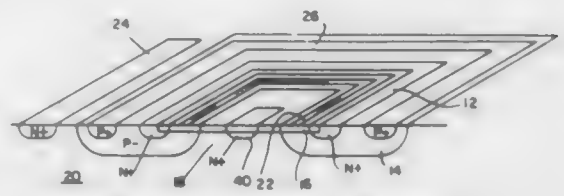
Kohsuke Nishimura, and Kazuo Sakai, both of Tokyo, Japan, assignors to Kokusai Denshin Denwa Co., Ltd., Tokyo, Japan

Filed Jul. 31, 1990, Ser. No. 560,692
Claims priority, application Japan, Sep. 1, 1989, 1-224712
Int. Cl.[5] H01L 27/14
U.S. Cl. 357—17 13 Claims

1. A light emitting semiconductor device comprising;

a substrate made of one selected from III-V group compound semiconductor, and group IV semiconductor,

an active layer (3) sandwiched by clad layers (2,4) deposited on said substrate (1),



said active layer and clad layers being made of group II-VI compound semiconductor which lattice matches with the substrate, and has essentially the same linear thermal expansion coefficient as that of the substrate.

5,010,377

ISOLATED GATE MESFET AND METHOD OF TRIMMING

James D. Beasom, Melbourne Village, Fla., assignor to Harris Corporation, Melbourne, Fla.

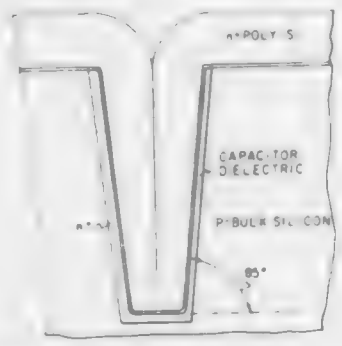
Division of Ser. No. 164,342, Mar. 4, 1988, Pat. No. 4,418,746.
This application Jun. 14, 1990, Ser. No. 537,936
Int. Cl.[5] H01L 29/80
U.S. Cl. 357—22 28 Claims

1. A junction field effect transistor comprising

a drain region of a first conductivity type,
an annular bottom gate region of a second conductivity type in said drain region;
a source region of said first conductivity type in said annular bottom gate region;
a channel region of said first conductivity type extending through said bottom gate region and connecting said source and drain regions; and
an annular top gate in contact with said channel region, and isolated from said bottom gate region by said channel region, and of a material forming a Schottky barrier diode with said channel region.

5,010,378

TAPERED TRENCH STRUCTURE AND PROCESS



Monte A. Douglas, Coppell, Tex., assignor to Texas Instruments Incorporated, Dallas, Tex.

Continuation of Ser. No. 296,397, Jan. 6, 1989, Pat. No. 4,916,511, which is a continuation of Ser. No. 10,374, Feb. 3, 1987, abandoned, which is a division of Ser. No. 841,391, Mar. 19, 1986, Pat. No. 4,690,729, which is a continuation-in-part of Ser. No. 730,701, May 3, 1985, Pat. No. 4,702,795. This application Feb. 20, 1990, Ser. No. 481,430

The portion of the term of this patent subsequent to Apr. 10, 2007, has been disclaimed.

Int. Cl.[1] **H01L** *29/68, 29/06, 27/02*

U.S. Cl. 357—23.6 **10 Claims**

1. An integrated circuit, comprising:
(a) a semiconductor layer with a surface;
(b) at least one memory cell at said surface, said memory cell including a capacitor and an access device connected to said capacitor;
(c) wherein said capacitor has a plate along a sidewall of a trench that extends from said surface into said layer, said trench with an aspect ratio of at least 2.5 to 1 and positively sloping sidewalls without bowing or undercut

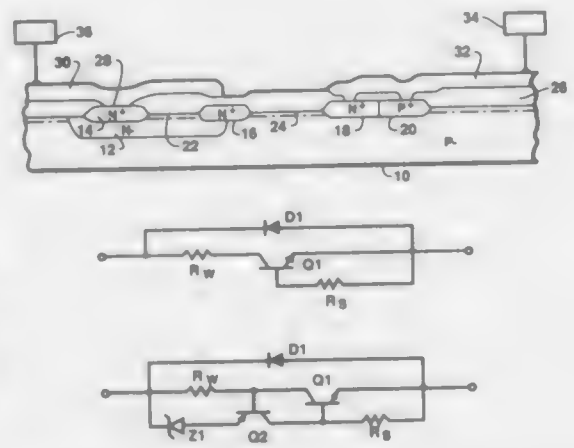
VOLTAGE STRESS ALTERABLE ESD PROTECTION STRUCTURE



Leslie R. Avery, Flemington, N.J., assignor to David Sarnoff Research Center, Inc.

Filed May 4, 1990, Ser. No. 516,497

Claims priority, application United Kingdom, May 17, 1989, 8911360

Int. Cl.[1] **H01L** *29/06*

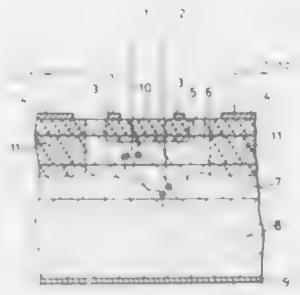
U.S. Cl. 357—23.13 **15 Claims**

1 A protection circuit comprising:
a semiconductor substrate of a first conductivity type having a surface;
a well region of second conductivity type in the substrate at the surface thereof, the well region of second conductivity type having disposed therein spaced first and second regions of second conductivity type having relatively higher conductivity than the well region;
a third region of first conductivity type in the substrate at the surface thereof and spaced from the well region;
a fourth region of second conductivity type in the substrate at the surface thereof spaced from the well region and adjacent the third region;
a terminal overlying and contacting the surface over the first region; and
a field layer of first conductivity type in the substrate and adjacent the surface thereof extending completely between the first and second regions and completely between the third and fourth regions;

said circuit forming a first transistor of a first conductivity type in which the fourth region of second conductivity type forms the emitter, the substrate forms the base region, and the second region forms the collector; a diode formed between the well region and the substrate; a resistor formed by the portion of the well region between the first and second regions; and a resistor formed by the portion of the substrate between the second and the third regions.

5,010,381

SEMICONDUCTOR LIGHT RECEIVING ELEMENT



Tetsuo Shiba, Itami, Japan, assignor to Mitsubishi Denki Kabushiki Kaisha, Japan

Filed Feb. 28, 1990, Ser. No. 486,354

Claims priority, application Japan, Aug. 24, 1989, 1-219903

Int. Cl.[1] **H01L** *27/14*

U.S. Cl. 357—30 **15 Claims**

1 A semiconductor light detector comprising:
a semiconductor substrate;
at least two first conductivity type semiconductor layers successively disposed on said semiconductor substrate, each layer having an energy band gap, the energy band gaps of the respective layers increasing from the substrate to the layer most distant from the substrate, the layer most distant from the substrate including a light incident surface;
a first second conductivity type semiconductor region disposed at the surface extending into the layer most distant from the substrate; and
a successive second conductivity type semiconductor region corresponding to each first conductivity type layer between the most distant first conductivity type layer and the substrate extending from the surface to the corresponding layer, each successive second conductivity type region being successively disposed more remotely from the first second conductivity type region.

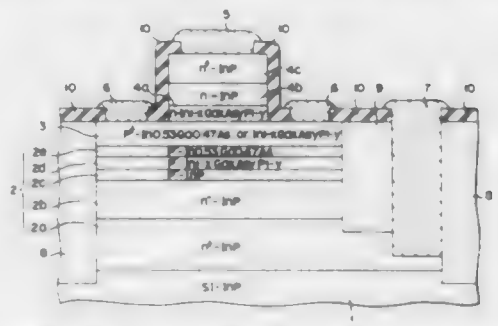
HETEROJUNCTION BIPOLAR TRANSISTOR HAVING DOUBLE HETERO STRUCTURE

Riichi Katoh, Yokohama, Japan, assignor to Kabushiki Kaisha Toshiba, Kawasaki, Japan



Filed Dec. 4, 1989, Ser. No. 445,984

Claims priority, application Japan, Dec. 9, 1988, 63-311753; Feb. 14, 1989, 1-34405

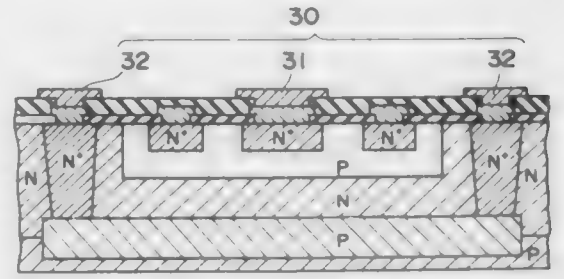
Int. Cl.[5] **H01L** *29/72, 27/12, 29/161*

U.S. Cl. 357—34 **10 Claims**

1. A double heterojunction bipolar transistor, comprising:
a first conductivity type emitter layer;
a second conductivity type base layer which is in contact with the emitter layer and forms a first heterojunction in conjunction with the emitter layer; and
a collector layer which is in contact with the base layer, said collector layer being made up of a first conductivity type semiconductor layer and a second conductivity type semiconductor layer and including a second conductivity type low-impurity concentration layer which is in contact with the base layer such that the low-impurity concentration layer has an impurity concentration lower than that of the base layer, said collector layer forming a second heterojunction in conjunction with the base layer, the second heterojunction including a transition layer which is formed such that the band gap thereof varies stepwise or smoothly, said transition layer being isolated from the base layer, and said emitter layer and said collector layer being formed of a semiconductor material having a band gap wider than that of the base layer.

5,010,383

POWER TRANSISTOR DEVICE AND METHOD FOR MAKING THE SAME



Masaharu Wataguchi, Ota, Japan, assignor to Sanyo Electric Co. Ltd., Osaka, Japan

Continuation of Ser. No. 310,781, Feb. 14, 1989, abandoned. This application Oct. 11, 1990, Ser. No. 596,737

Claims priority, application Japan, Feb. 18, 1988, 63-35662

Int. Cl.[5] **H01L** *29/72*

U.S. Cl. 357—36 **9 Claims**

1. A power transistor device comprising:
a collector region made of a first conductivity type and having an upper surface;
a base region made of a second conductivity type and provided within said collector region and having an upper surface flush with said upper surface of said collector region;
an elongated resistor region provided within said base region and having said first conductivity type and having an upper surface flush with said upper surface of said base region, said elongated resistor region forming first and second emitter stabilizing resistances which are aligned substantially linearly;
a first elongated emitter region provided within said base region located on one side of said elongated resistor region and extending in a direction of elongation parallel to said elongated resistor region and having an upper surface flush with said upper surface of said base region;
a second elongated emitter region provided within said base region located on an opposite side of said elongated resistor region and extending in a direction of elongation parallel to said elongated resistor region and having an upper surface flush with said upper surface of said base region,

connecting means for electrically connecting said first and second elongated emitter regions respectively with opposite ends of said elongated resistor region; and

emitter electrode means connected to said elongated resistor region at an area between said first and second emitter stabilizing resistances.

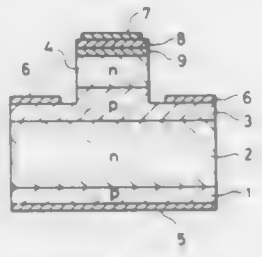
GATE TURN-OFF THYRISTOR WITH RESISTANCE LAYERS



Hiromu Haruki; Fumiaki Kirihata, and Osamu Hashimoto, all of Kawasaki, Japan, assignors to Fuji Electric Co., Ltd., Kawasaki, Japan

Continuation of Ser. No. 147,738, Jan. 25, 1988, abandoned. This application Jul. 20, 1989, Ser. No. 383,263

Claims priority, application Japan, Jan. 29, 1987, 62-018963; Aug. 6, 1987, 62-196911

Int. Cl.[5] H01L *29/74, 27/02, 29/06, 29/52*

U.S. Cl. 357—38 **2 Claims**

2. A gate turn-off thristor, comprising:

a first main electrode;

an emitter layer of a first conductivity type disposed on said first main electrode;

a first base layer of a second conductivity type disposed on said emitter layer;

a second base layer of the first conductivity type disposed on said first base layer, said second base layer having a plurality of protrusions;

a plurality of emitter layers of the second conductivity type disposed on respective ones of said plurality of protrusions of said second base layer, each of said plurality of emitter layers being in the form of a protruded island;

a gate electrode disposed on a portion of said second base layer other than said protrusions on which said plurality of emitter layers are disposed;

a plurality of metal layers disposed on said plurality of emitter layers, respectively;

a plurality of resistance layers disposed on said plurality of metal layers, respectively; and

a plurality of second main electrodes disposed on said plurality of resistance layers;

wherein each respective one of said plurality of resistance layers, in the respective direction of the thickness of each of said plurality of resistance layers, has a resistance within a range from 15 to 500 $m\Omega \cdot mm^2$.

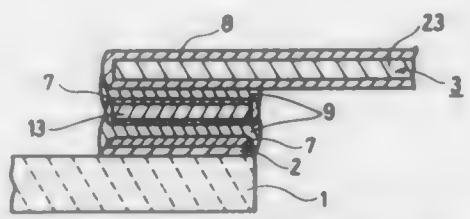
CONNECTION STRUCTURE BETWEEN COMPONENTS FOR SEMICONDUCTOR APPARATUS



Akira Sasame; Hitoyuki Sakanoue; Hisao Takeuchi; Masaya Miyake; Akira Yamakawa; Yasuhisa Yushio, and Hitoshi Akazawa, all of Hyogo, Japan, assignors to Sumitomo Electric Industries, Ltd., Osaka, Japan

Filed Jun. 28, 1988, Ser. No. 212,944

Claims priority, application Japan, Jul. 3, 1987, 62-165190; Jul. 14, 1987, 62-175070; Oct. 30, 1987, 62-275277; Dec. 15, 1987, 62-315330

Int. Cl.[5] H01L *23/48, 23/02, 39/02, 29/44*

U.S. Cl. 357—70 **9 Claims**

1. A connection structure between components of a semiconductor apparatus, comprising: a base member made of aluminum nitride having a major surface on which a semiconductor device is to be mounted, said aluminum nitride having a first thermal expansion coefficient, a connection member to be joined to said base member, said connection member being made of an alloy selected from the group consisting of iron-nickel alloys and iron-nickel-cobalt alloys having a second thermal expansion coefficient, a plastically deformable stress relieving member interposed between said aluminum nitride base member and said connection member, and a soldering material for joining said base member, said stress relieving member, and said connection member, said plastically deformable stress relieving member being made of a material selected from the group consisting of copper, copper alloys, nickel alloys, iron, and aluminum having a plastic deformability sufficiently high for relieving a thermal stress caused by a difference between said first and second thermal expansion coefficients of said base member and of said connection member during a cooling process at the time of soldering.

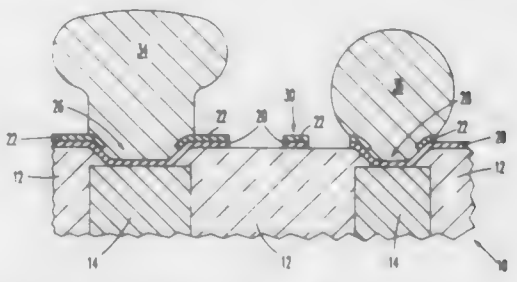
INTEGRATED CIRCUIT SUBSTRATE WITH CONTACTS THEREON FOR A PACKAGING STRUCTURE



Peter Gassauge, Boeblingen; Volker Kreuter, Schoenaich, and Helmut Schettler, Dettenhausen, all of Fed. Rep. of Germany, assignors to International Business Machines Corporation, Armonk, N.Y.

Filed May 29, 1990, Ser. No. 529,827

Claims priority, application European Pat. Off., Jul. 26, 1989, 89113765.5

Int. Cl.[5] H01L *23/48*

U.S. Cl. 357—67 **18 Claims**

1. An integrated circuit substrate with contacts thereon for a packaging structure comprising:

a substrate with at least one terminal means,

a conductive layer on said substrate covering at least a portion of said terminal means;

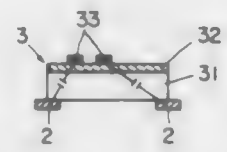
a conductive bump on at least a portion of said conductive layer;

an insulator layer on said conductive layer around at least a portion of said conductive bump, and wherein at least a portion of said insulator layer is underneath said conductive bump.

5,010,390

PLASTIC-MOLDED SEMICONDUCTOR DEVICE

Shigeru Tanaka, Fujisawa, Japan, assignor to Kabushiki Kaisha Toshiba, Kawasaki, Japan



Continuation of Ser. No. 640,875, Aug. 15, 1984, Pat. No. 4,768,078. This application Sep. 3, 1987, Ser. No. 92,521

Claims priority, application Japan, Aug. 31, 1983, 58-160124

The portion of the term of this patent subsequent to Aug. 30, 2005, has been disclaimed.

Int. Cl.[5] H01L *23/28, 23/48*

U.S. Cl. 357—72 **1 Claim**

1. A device comprising:

a semiconductor pellet having an insulating substrate with a periphery along an outer edge of said insulating substrate,

an integrated circuit formed on said insulating substrate, and

a pellet mounting member on which said semiconductor pellet is mounted, said pellet mounting member having a lead frame with a conductive support means for supporting said insulating substrate in a manner to produce a reduced parasitic capacitance by contacting said insulating substrate only at the periphery of said insulating sub-

strate, wherein said device is a plastic-molded semiconductor device,

wherein said lead frame has an inner lead, wherein said conductive support means is in form of a substantially rectangular ring of substantially the same size as said semiconductor pellet, and said substantially rectangular ring is connected to an end of said inner lead of said lead frame.

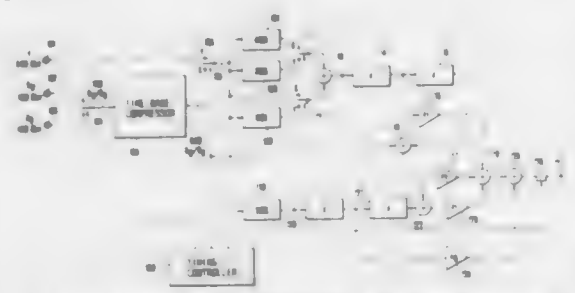
DIGITAL VIDEO SIGNAL PROCESSING DEVICE



Makoto Shimokoriyama, Kanagawa, and Toshihiro Yagisawa, Tokyo, both of Japan, assignors to Canon Kabushiki Kaisha, Tokyo, Japan

Filed Oct. 24, 1988, Ser. No. 261,915

Claims priority, application Japan, Oct. 27, 1987, 62-272281; Oct. 27, 1987, 62-272284

Int. Cl.[5] H04N *11/10*

U.S. Cl. 358—14 **5 Claims**

1 A digital video signal processing device, comprising:

(a) time-division multiplexing means for providing a time-division multiplexed signal by time-division multiplexing a digital luminance signal with a line-sequential digital color difference signal for each horizontal scanning line;

(b) a digital filter for limiting a bandwidth of said time-division multiplexed signal in a two-dimensional frequency region, said digital filter including a delay circuit for delaying said time-division multiplexed signal;

(c) sampling means for subsampling said time-base multiplexed signal output from said digital filter; and

(d) control means for controlling a bandwidth to be limited by said digital filter, said control means including a switching circuit for switching a delay time of said delay circuit so that said digital luminance signal is delayed for a first delay time and said line-sequential digital color differential signal is delayed for a second delay time which is different from the first delay time where said bandwidth is determined corresponding to a two-dimensional frequency by said sampling means for said digital luminance signal and said line-sequential digital color difference signal

METHOD OF AND APPARATUS FOR RECEIVING HIGH DEFINITION TELEVISION SIGNALS

Michael G. Croll, Horsham, United Kingdom, assignor to British Broadcasting Corporation, London, England

Filed Jul. 28, 1989, Ser. No. 386,785

Claims priority, application United Kingdom, Jul. 28, 1988, 8817978; Jul. 28, 1988, 8817979

Int. Cl.[5] H04N *11/22, 9/64*

U.S. Cl. 358—21 R **23 Claims**

1 A method of receiving high definition television signals transmitted in a first signal format, comprising

receiving the signals and decoding with a first decoder compatible with the first signal format to provide first decoded luminance and chrominance components;

time compressing the decoded luminance and chrominance components under the control of a control signal which determines the degree of time compression,

decoding the time compressed signals with a second decoder compatible with the time compressed signal to provide decoded time compressed signals,

time expanding the decoded time compressed signals under the control of the control signal, the control signal determining a degree of time expansion substantially equal to the degree of time compression; and

displaying or recording the information conveyed by the time expanded signals.

5,010,393

METHOD AND APPARATUS FOR ADJUSTING CHROMA

Kenji Saito, Tokyo, Japan, assignor to Fuji Photo Film Co., Ltd., Kanagawa, Japan

Filed Jul. 27, 1989, Ser. No. 385,449

Claims priority, application Japan, Aug. 30, 1988, 63-216105

Int. Cl.[5] H04N *9/64*

U.S. Cl. 358—29 **20 Claims**

1 An apparatus for adjusting chroma comprising

image pickup means, coupled to image signals of a desired scene, for converting said image signals to red, green, and blue color signals,

color signal amplifier means, coupled to said image pickup means, for amplifying said red, green, and blue color signals,

matrix means, coupled to said color signal amplifier means, for converting said amplified red, green and blue color signals to a brightness signal and first and second color difference signals;

video signal producing means, coupled to said matrix means, for combining said first and second color difference signals to produce a chroma signal and for amplifying said chroma signal in a chroma amplifier to provide as output an amplified chroma signals;

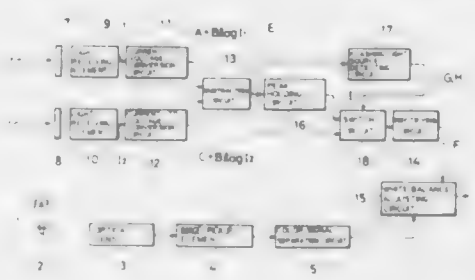
strong color difference signal detection means, coupled to said matrix means, for detecting when both of said first and second color difference signals exceed a predetermined range of acceptable levels and for outputting strong color difference signals indicative thereof; and

chroma information detecting means, coupled to said strong color difference signal detection means, for combining said strong color difference signals and for outputting a chroma indicative signal of a level corresponding to the level of high chroma colors present in said desired scene,

said chroma amplifier controlled in response to said chroma indicative signal to have a normal chroma gain level when said level of high chroma colors is high and to have a high chroma gain level when said level of high chroma colors is low.

5,010,394

AUTOMATIC WHITE BALANCE CIRCUIT CAPABLE OF EFFECTIVELY ADJUSTING WHITE BALANCE UNDER A FLASHING LIGHT SOURCE



Fumihide Murao, Itami, Japan, assignor to Mitsubishi Denki Kabushiki Kaisha, Tokyo, Japan

Filed Aug. 1, 1989, Ser. No. 387,999

Claims priority, application Japan, Jan. 18, 1989, 1-9016

Int. Cl.[5] H04N *9/73 C*

U.S. Cl. 358—29 **10 Claims**

1 An automatic white balance circuit contained in an image pickup apparatus for automatically adjusting white balance when there is a change in ratios between respective color components included in light applied from a light source to an object picked up by said image pickup apparatus, said automatic white balance circuit comprising:

ratio signal generating means for receiving said light from said light source to generate and output a ratio signal indicating a ratio between prescribed two of said color components included in said light;

a holding circuit connected to said ratio signal generating means for holding and outputting said ratio signal corresponding to a maximum value of illuminance of said light applied from said light source to said object;

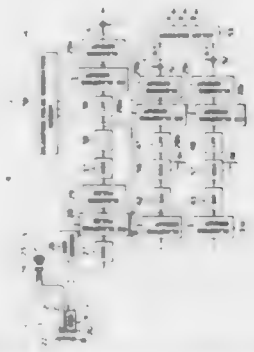
a flashing light source detecting circuit for detecting a number of flashing times of said light source to output a first signal when said number of flashing times exceeds a prescribed number while outputting a second signal when the former is less than the latter;

a switch circuit connected to said ratio signal generating means, said holding circuit and said flashing light source detecting circuit for outputting an output of said holding circuit in response to said first signal from said flashing light source detecting circuit while outputting an output from said ratio signal generating means in response to said second signal; and

a white balance adjusting circuit for adjusting white balance in accordance with an output from said switch circuit.

5,010,395

SOLID STATE IMAGING APPARATUS



Kiyoshi Tsuji, Tanashi, and Kenji Kimura, Tachikawa, both of Japan, assignors to Olympus Optical Co., Ltd., Tokyo, Japan

Filed Mar. 13, 1989, Ser. No. 322,038

Claims priority, application Japan, Apr. 20, 1988, 63-98840; May 25, 1988, 63-129238

Int. Cl.[5] A61B *1/04*, **H04N** *5/18*

U.S. Cl. 358—44 **5 Claims**

1. A solid state imaging apparatus comprising:

an imaging means having a solid state imaging device for photoelectrically converting an object image and outputting a picture image signal;

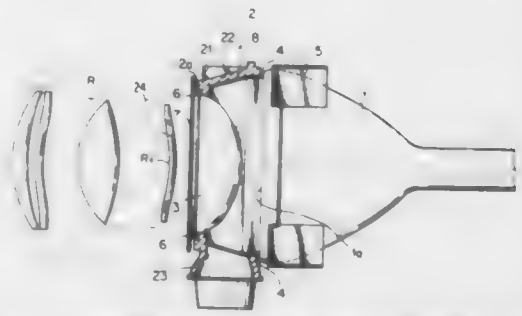
a signal processing means connected with said imaging means, for processing said picture image signal obtained by said solid state imaging device and outputting a video signal;

a gain adjusting means provided in said signal processing means for receiving the photoelectrically converted output of said solid state imaging device and variably controlling the gain; and

a direct current-clamping means connected to receive an output from said gain adjusting means for direct current-clamping an optical black part included in the output signal of said solid state imaging device and stabilizing the black level of said video signal.

5,010,396

TELEVISION PROJECTOR FOR PROJECTION DISPLAY



Masaaki Hanyu, and Yukio Ozaki, both of Tokyo, Japan, assignors to Pioneer Electronic Corporation, Tokyo, Japan

Filed Apr. 26, 1990, Ser. No. 514,803

Claims priority, application Japan, Jul. 31, 1989, 1-196927

Int. Cl.[5] H04N *9/31*

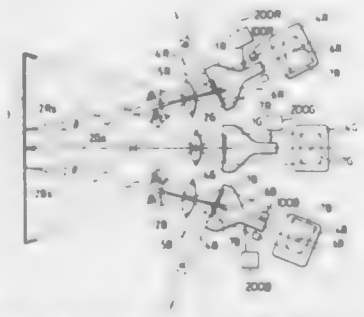
U.S. Cl. 358—60 **6 Claims**

1. A TV projector for a three-tube projection display which projects a red picture, a green picture and a blue picture by three projection TV CRTs through three projection lenses disposed in front of the three projection TV CRTs, respectively, wherein a component lens of at least one of the projection lenses of the TV projector contains a light-absorbing

substance capable of absorbing light components of the corresponding color picture in a sideband of the spectrum of the color picture.

5,010,397

TRIPLE TUBE TYPE PROJECTION TELEVISION



Shinichi Hasegawa, Tokyo, Japan, assignor to Pioneer Electronic Corporation, Tokyo, Japan

Filed Jul. 3, 1989, Ser. No. 374,699

Claims priority, application Japan, Oct. 26, 1988, 63-268308

Int. Cl.[5] H04N *9/31*

U.S. Cl. 358—60 **4 Claims**

1 A triple tube type projection television for projecting images from blue, green and red projecting tubes onto a screen by lenses disposed in front of the respective projecting tubes and synthesizing the images from said three projecting tubes on the screen to provide a color image, wherein

intersection points between the screen and respective ones of the optical axes of lenses on both sides of a central lens are offset outwardly from the intersection point between the screen and the optical axis of the central lens;

tube centers of the projecting tubes on said both sides are dislocated outwardly from the optical axes of the lenses therefor;

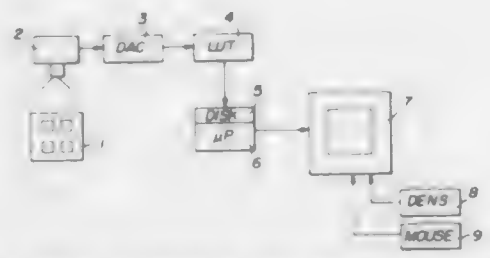
said triple tube type projection television comprising:

cooling means coupled to said projecting tubes in order to proved adequate cooling thereof; and

means for applying an external magnetic field to said projecting tubes in order to supplementally adjust the images on the screen.

5,010,398

METHOD FOR COLOUR CORRECTION BY DRY DOT ETCHING USING PHOTOGRAPHICALLY PRODUCED MASK



Pierre H. Nys, Berchem; Paul W. Vinck, Hove, both of Belgium, and Andreas von Erdmannsdorff, Monheim, Fed. Rep. of Germany, assignors to AGFA-Gevaert, N.V., Mortsel, Belgium

Filed Jun. 29, 1989, Ser. No. 372,844

Claims priority, application European Pat. Off., Aug. 23, 1988, 88201787.4

Int. Cl.[5] G03F *3/08, 3/10*

U.S. Cl. 358—80 **5 Claims**

1 A method of producing dot-size corrected or modified halftone colour separations of an image for use in making a printing plate for printing reproductions of said image, which method comprises the steps of scanning each of said halftone separations separately to produce an electrical signal representing the same and digitizing said signals,

storing said digitized values into a digital storage device,

visualising from said digitized values on an image display device an image representative of at least one of said halftone separations,

defining on said displayed image and by means of said stored values at least one area to be corrected,

calculating by means of a microprocessor to which said stored values are applied at least one combination of halftone colour separation positives and/or negatives of said image that when exposed in overlaying relation on a photographic film yields a mask for isolating each such area to be corrected,

visualising and evaluating the resultant mask alone or in superposition with at least one of said halftone separations on said image display device,

redefining said area to be corrected in accordance with the result of said evaluation and recalculating a mask therefor by means of the stored data or by means of data pertaining to the previously calculated mask and visualising said recalculated mask for further evaluation as an acceptable final mask,

photographically producing said recalculated mask for isolating said area to be corrected,

determining the percentage dot size correction (increase or decrease) that is required, and

exposing and processing light-sensitive print material to produce a print exhibiting the required percentage dot-size correction by subjecting said print material to a normal exposure for reproducing the corresponding original halftone separation plus an additional overexposure through the combination of said final mask and the corresponding halftone separation for a dose to give the determined change in dot size

VIDEO TRANSMISSION AND CONTROL SYSTEM UTILIZING INTERNAL TELEPHONE LINES

David D. Goodman, Arlington, Va., and Robert Domnitz, Lexington, Mass., assignors to Inline Connection Corporation, Arlington, Va.

Filed Jul. 14, 1989, Ser. No. 379,751

Int. Cl.[5] H04N *7/12*

U.S. Cl. 358—85 **30 Claims**

2 A communications system that includes a network of wiring, a plurality of ports ordinarily used for connection of telephone equipment to said network, and an interface to a telephone system, said ports being located in different areas, said network comprising a plurality of 2-wire conductive paths connecting said ports to said interface, the communications system including a first one of said ports and a first electronic device (1) located in a first area, and a second one of said ports and a second electronic device (15) located in a second area, the system further including an apparatus (2) located in said

first area, said apparatus responding to infrared light signals received from an infrared light transmitter for determining operational modes of said apparatus, said apparatus being out of range of said light transmitter when said light transmitter is located in the second area, wherein:

(a) said second electronic device (15) further includes:

first converting means for converting infrared light radiation to a first series of electrical impulses,

first representing means for representing said first series of electrical impulses as a second series of electrical impulses, information content of said second series being substantially the same as the information content of said first series, substantially all of the energy of said second series being concentrated at frequencies above the highest frequency used for communication by ordinary telephone devices, wherein said first representing means includes:

means for creating a weighted average signal, said weighted average signal being a weighted average of the energy level of said first series of electrical impulses over a preceding time period of predetermined length,

means for creating a first bi-level signal, said first bi-level signal assuming a high state when the energy level of said first series of electrical impulses exceeds said weighted average signal, said first bi-level signal otherwise assuming a low state,

means for suppressing noise by creating a second bi-level signal, said second bi-level signal assuming a high state whenever the energy level of said first series of electrical impulses exceeds said weighted average by a fixed factor at any time over a preceding time period of fixed length, said second bi-level signal otherwise assuming a low state, and

means for providing an RF carrier only when both said first bi-level signal and said second bi-level signal are at the higher of their two said levels;

said second electronic device (15) further including first transmitting means, connected to said second one of said ports, for transmitting said second series of electrical impulses onto the network, said first transmitting means comprising first filtering means for presenting a high impedance to signals whose energy is concentrated at frequencies below the highest frequency used for communication by ordinary telephone devices, while allowing said second series of electrical impulses to transmit substantially unchanged, and wherein

(b) said first electronic device (1) further includes:

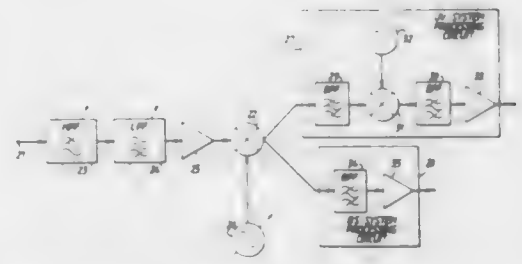
first recovering means, connected to said first one of said ports, for recovering said second series of electrical impulses from the network wiring, said first recovering means comprising second filtering means for presenting a high impedance to signals whose energy is concentrated at frequencies below the highest frequency used for communication by ordinary telephone devices, while allowing said second series of electrical impulses to transmit substantially unchanged,

second representing means for representing said second series of electrical impulses as a third series of electrical impulses, information content of said third series being substantially the same as the information content of said second series, and

second converting means for converting said third series of electrical impulses to infrared light radiation, said second converting means creating a light pattern with substantially the same characteristics as the light pattern created by the infrared light radiation in the second area.

5,010,400

TELEVISION TUNER FOR RECEIVING MULTIPLE BAND TELEVISION SIGNALS



Hideki Oto, Saitama, Japan, assignor to Kabushiki Kaisha Toshiba, Kanagawa, Japan

Filed Aug. 2, 1989, Ser. No. 388,493

Claims priority, application Japan, Aug. 3, 1988, 63-193998

Int. Cl.[5] H04N *1/00, 7/10*

U.S. Cl. 358—86 **7 Claims**

1. A television tuner for use in a television receiver to receive a VHF signal band, a UHF signal band, and a satellite signal band converted from a received satellite signal, all of which are provided as a combined signal by a

an input means to receive the combined signal from the signal combiner;

first oscillator having variable frequency;

first mixer means to receive the combined signal and the output of the first oscillator means to convert the combined signal into a first intermediate frequency signal if the VHF and UHF signals are to be utilized by the television receiver or a second intermediate frequency signal if the satellite signal is to be utilized by the television receiver;

first and second band-pass filter means connected to the first mixer means to receive first and second intermediate frequency signals, wherein the first band-pass filter means is designed to pass the first intermediate frequency signal and the second band-pass filter means is designed to pass the second intermediate frequency signal; and

means for processing the signals passed by the first and second band-pass filter means to provide a standard VHF and UHF television signals and a frequency modulated satellite signal.

5,010,401

PICTURE CODING AND DECODING APPARATUS USING VECTOR QUANTIZATION

Tokumichi Murakami; Kohtaro Asai; Koh Kamizawa; Masami Nishida, all of Kamakura; Eizo Yamazaki, Tokyo; Atsushi Itoh, Yokohama, and Naoto Kinjoh, Kamakura, all of Japan, assignors to Mitsubishi Denki Kabushiki Kaisha, Tokyo, Japan

PCT No. PCT/JP88/00796, § 371 Date Apr. 7, 1989, § 102(e) Date Apr. 7, 1989

PCT Filed Aug. 11, 1988, Ser. No. 340,009

Int. Cl.[5] H04N *7/12, 7/18*

U.S. Cl. 358—136 **8 Claims**

1. An interframe encoding and decoding apparatus comprising:

an encoding section composed of

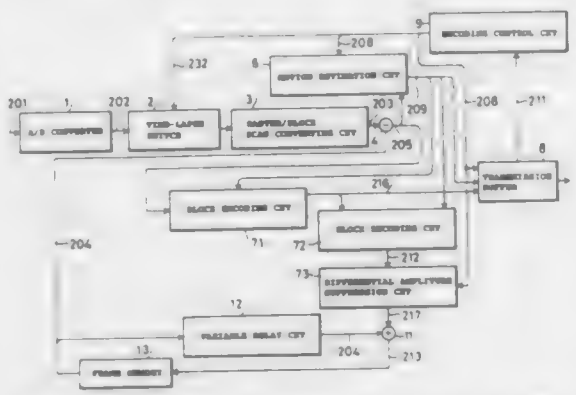
a frame memory for storing one frame of a video signal series;

a raster/block scan converting circuit for dividing an input signal series into blocks of k samples each (k: a positive integer) to form input block data;

a subtractor for obtaining interframe differential block data by subtracting block data stored in said frame memory from said input block data, corresponding to the same position as that of the input block data in the period of at least one frame before;

a motion detecting circuit for comparing an absolute value

sum of amplitudes of samples within the block of said interframe differential block data with a motion detection threshold value, and detecting motion in units of block and determining motion information of movement existing when said sum is greater than said threshold value and no movement when said sum is less than said threshold value;



a block encoding circuit for encoding the interframe differential block data of movement existing as valid blocks into encoded block data;

a transmission data buffer for converting the motion information and the encoded block data into a suitable code word and storing it for a predetermined and fixed time, and then transmitting it together with the motion detection threshold value to the transmission line at a predetermined and fixed speed and calculating the storage amount of the encoded data in the predetermined and fixed time;

an encoding control circuit for determining said motion detection threshold value and an input time lapse according to changes of said storage amount of encoded data;

a block decoding circuit for decoding said encoded block data to reproduce the interframe differential block data of movement existing, and discriminating blocks of no movement as invalid blocks and making sample values of an interframe differential decoded block data corresponding to an invalid block all zero;

a differential amplitude suppressing circuit for suppressing the amplitude value of the decoded interframe differential block data obtained in said block decoding circuit non-linearly based on said motion detection threshold value; and

an adder for adding the suppressed decoded interframe differential block data to said block data in the frame memory and obtaining reproduction block data, and replacing block data in said frame memory with reproduction block data of the same position in a frame as that of the block data in the frame memory; and

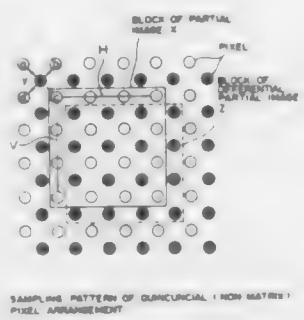
a decoding section composed of

a reception data buffer memory for receiving the encoded data supplied through the transmission line and storing it for a predetermined and fixed time, and then decoding the motion information and the encoded block data from the code word and separating and outputting the motion detection threshold value;

a block decoding circuit for decoding and reproducing the interframe differential block data of movement existing from said encoded block data from said reception buffer memory, and discriminating the block of no movement as an invalid block and making sample values of the reproduced interframe differential block data corresponding to an invalid block all zero;

a differential amplitude suppressing circuit for suppressing the amplitude value of the decoded interframe differential block data obtained in said block decoding circuit non-linearly based on the motion detection threshold value;

a frame memory for storing one frame of a video signal series in blocks;



an adder for adding the suppressed interframe differential decode block data to the block data from said frame memory and obtaining reproduction block data, and writing the reproduction block data at the same position as that of the block data within said frame memory; and a block-/raster scan converting circuit for converting the reproduction block data from said adder into a signal series in raster form.

5,010,402

VIDEO SIGNAL COMPRESSION APPARATUS

Masakazu Nishino, Kashiwara, Japan, assignor to Matsushita Electric Industrial Co., Ltd., Osaka, Japan

Filed May 17, 1990, Ser. No. 524,741
Int. Cl.[5] H04N *7/133*
U.S. Cl. 358—138 **6 Claims**

1. A video signal compression apparatus comprising:

a separation circuit for receiving a video signal having a non-matrix pixel arrangement and separating the received signal into a plurality of partial images each having a matrix pixel arrangement;

an interpolation circuit for producing from a predetermined partial image of the plurality of partial images an interpolated partial image for pixel positions of a remaining partial image of them;

a subtractor circuit for producing a differential partial image from the difference between the remaining partial image and the interpolated partial image;

an orthogonal transformation and coding circuit for converting the predetermined partial image into a plurality of blocks and coding them by an orthogonal transformation;

a coding circuit for converting the differential partial image into plural blocks to code them;

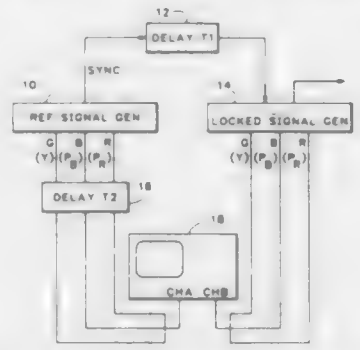
a code length estimate circuit for determining a code length of a coded output of the coding circuit; and

a code length assignment circuit for assigning a code length of a coded output of the orthogonal transformation and coding circuit adaptively by a code length output determined by the code length estimate circuit.

5,010,403

MEASUREMENT OF TIMEBASE JITTER FOR COMPONENT VIDEO

Edward D. Wardzala, Portland, Oreg., assignor to Tektronix, Inc., Beaverton, Oreg.



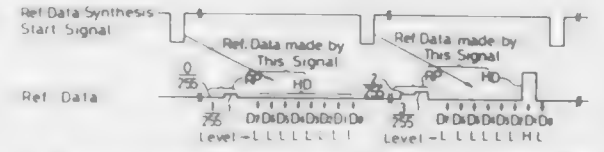
Filed Apr. 12, 1990, Ser. No. 507,817
Int. Cl.[5] H04N *17/00*
U.S. Cl. 358—139 **12 Claims**

1. A method of measuring timebase jitter comprising the steps of:

generating a test signal from a reference signal generator and

from a local signal generator the two test signals being identical;

adjusting the timing between the two test signals; and



processing the test signals together to provide a display of the timebase jitter.

5,010,404

CHARACTERISTICS CORRECTOR

Yoshiyuki Sasaki; Kenji Tsunashima; Ikuo Ookuma, and Toshifumi Fujii, all of Nagaokakyo, Japan, assignors to Mitsubishi Denki Kabushiki Kaisha, Tokyo, Japan

Filed Dec. 13, 1988, Ser. No. 283,981
Claims priority, application Japan, Dec. 14, 1987, 62-315597; Jun. 30, 1988, 63-164540; Jul. 22, 1988, 63-184247
Int. Cl.[5] H04N *17/00*
U.S. Cl. 358—139 **10 Claims**

1. A characteristics corrector in a video signal processing system for correcting characteristics of the video signal processing system at the time of recording and/or reproducing a video signal, the corrector comprising:

reference pulse generating means for generating reference pulses of varying amplitudes corresponding to plural gradations from a black level to a white level of a video signal to be recorded, the reference pulses, each being of a single non-varying amplitude and being recorded during a blanking period of the video signal;

pulse amplitude data generating means for generating quantified data used for amplitude discrimination of the reference pulses;

reference data interleaving means for interleaving, as reference data, the reference pulses and corresponding pulse amplitude data indicative of the amplitudes thereof during the blanking period; and

level correcting means for correcting the level of a reproduced video signal by utilization of a plurality of reference pulses and corresponding pulse amplitude data obtained from the reproduced video signal.

5,010,405

RECEIVER-COMPATIBLE ENHANCED DEFINITION TELEVISION SYSTEM

William F. Schreiber, Cambridge; Andrew B. Lippman, Salem; Edward H. Adelson, Cambridge, all of Mass., and Aran N. Netravali, Westfield, N.J., assignors to Massachusetts Institute of Technology, Cambridge, Mass.

Filed Feb. 2, 1989, Ser. No. 305,796
Int. Cl.[5] H04N *7/04*
U.S. Cl. 358—141 **29 Claims**

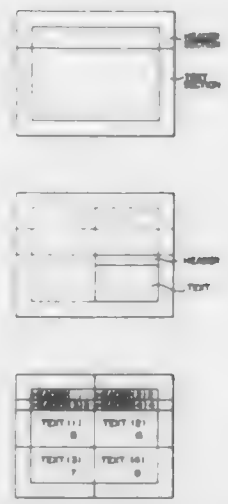
1. A television encoder for generating a receiver-compatible signal from a production video signal containing enhancement information which cannot be displayed on a standard receiver, the receiver-compatible signal being compatible with the standard receiver, the encoder comprising:

a. a filter bank for dividing the video signal into at least two groups of spatial frequency components including a first group and a second group, the first group containing members which when combined together form a standard video signal which is displayed by the standard receiver

and the second group containing the enhancement information;

b. a quantizer for quantizing at least one member of the first group;

c. a combiner for adding at least one member of the second group to a quantized member of the first group to produce a modified first group; and



d. a synthesizer for combining the members of the modified first group to generate the receiver-compatible signal.

5,010,406

APPARATUS FOR RECEIVING CHARACTER MULTIPLEX BROADCASTING

Toshikatsu Kawakami, Mishima; Shin Fukuda, Hirakata; Hiroyasu Shinbo, Toyonaka; Toyoaki Umemura, Itami; Ken Sakamoto, Takatsuki, and Tomoji Kondo, Takatsuki, all of Japan, assignors to Matsushita Electric Industrial Co., Ltd., Osaka, Japan

Filed May 19, 1989, Ser. No. 354,241
Claims priority, application Japan, May 25, 1988, 63-127733
Int. Cl.[5] H04N *7/087*
U.S. Cl. 358—147 **3 Claims**

1. A character multiplex broadcasting receiving apparatus comprising:

means for receiving, storing, and displaying character signals representing character images which were multiplexed for a vertical blanking period of a television signal including information representing a television image;

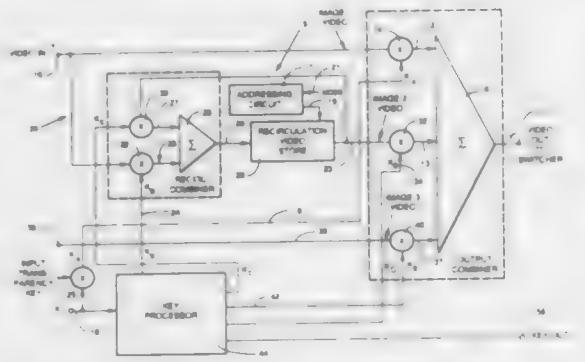
division signal generating means, receiving a horizontal pulse, a vertical pulse and a clock signal, for generating division signals, said division signals being employed in the reduction of a picture plane to be received and displayed and in the simultaneous display of images in a plurality of divided picture planes in a display screen

based on said horizontal pulse, said vertical pulse, and said clock signal; and

selection signal generating means for selecting either said television image or one of said character images for each of said divided picture planes.

5,010,407

VIDEO EFFECTS SYSTEM WITH RECIRCULATION VIDEO COMBINE AND OUTPUT COMBINE



David E. Trytko, Foster City, Calif., assignor to Ampex Corporation, Redwood City, Calif.

PCT No. PCT/US88/01031, § 371 Date Nov. 11, 1988, § 102(e) Date Nov. 11, 1988, PCT Pub. No. WO88/07801, PCT Pub. Date Oct. 6, 1988

Continuation of Ser. No. 32,155, Mar. 27, 1987, abandoned. This PCT application Mar. 25, 1988, Ser. No. 333,201

Int. Cl.[5] H04N *5/262, 9/74, 5/14, 5/53*

U.S. Cl. 358—183 26 Claims

1. A video effects system for generating composite output video from one or more video sources comprising:

a video input;

recirculation means having an output and having an input coupled to said video input for storing video from said video input and presenting said stored video at said output at a later time;

output combine means coupled to said video input and to the output of said recirculation means for combining video from said video input and from the output of said recirculation means in proportion to first and second key signals to generate composite output video;

a first key processor means for generating said first and second key signals such that one of said first and second key signals is a function of the other of said first and second key signals such that said output video does not have a gain in excess of the maximum available gain resource;

wherein said recirculation means includes means to couple a recirculated video from said output back into the input of said recirculation means to alter a gain of said recirculated video in accordance with a third key signal and to combine said recirculated video with video from said video input; and

further comprising second key processor means for generating said third key signal as a function of a fourth key signal such that the combined video stored in said recirculation means does not have a gain greater than a maximum available gain resource.

DOUBLY CORRELATED SAMPLE AND HOLD CIRCUIT

William J. Toobey, Pittsford, N.Y., assignor to Eastman Kodak Company, Rochester, N.Y.

Filed Sep. 25, 1989, Ser. No. 412,064

Int. Cl.[5] H04N *3/14, 5/335*

U.S. Cl. 358—213.11 26 Claims

1 Circuitry comprising:

first, second and third sample and hold circuits each having a control terminal, an input terminal and an output terminal;

the input terminals of the first and second sample and hold circuits being coupled together to a circuitry input terminal;

the output terminal of the first sample and hold circuit being coupled to the input of the third sample and hold circuit;

the second and third sample and hold circuits being essentially identical;

first and second essentially identical source followers each having a control terminal and an output terminal;

the output of the second sample and hold circuit being coupled to the control terminal of the first source follower;

the output terminal of the third sample and hold circuit being coupled to the control terminal of the second source follower;

subtraction means, which has a first input coupled to the output of the first source follower, has a second input coupled to the output of the second source follower and has an output coupled to a circuitry output terminal, for during operation of the circuitry subtracting signals appearing on the outputs of the source followers from each other to generate an output signal which is the difference between signals appearing on the output terminals of the source followers; and

the sample and hold circuits an the source followers being formed on a common semiconductor body which does not include the subtraction means.

IMAGE SENSING SYSTEM

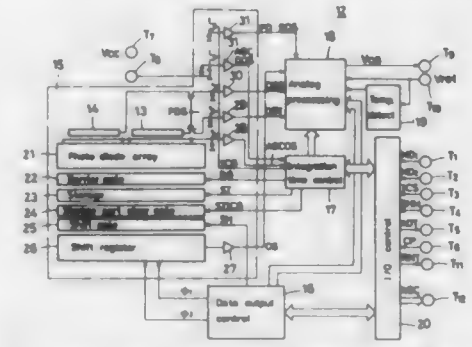
Tokuji Ishida; Toshio Norita, and Jun Hasegawa, all of Osaka, Japan, assignors to Minolta Camera Kabushiki Kaisha, Osaka, Japan

Continuation of Ser. No. 141,080, Jan. 5, 1988. This application Nov. 16, 1989, Ser. No. 437,526

Claims priority, application Japan, Jan. 6, 1987, 62-950; Mar. 18, 1987, 62-63459

Int. Cl.[5] H04N *3/14*

U.S. Cl. 358—213.19 4 Claims



1. An image sensing device comprising:

reference voltage generating means for generating a reference voltage;

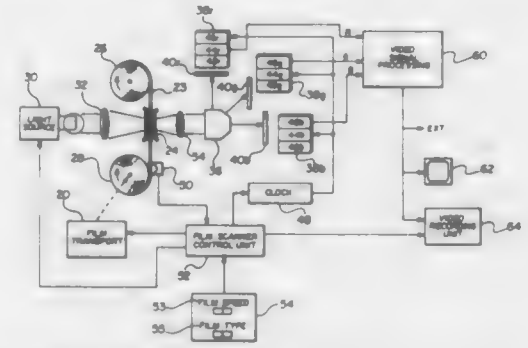
an image sensor for receiving light from an object and for outputting an electric signal;

A/D converting means for converting an analog signal into a digital signal, a dynamic range of said A/D converting means being limited to the reference voltage; and

voltage adjusting means for adjusting the electric signal from said image sensor based on the dynamic range of said

A/D converting means and transferring the adjusted signal to said A/D converting means.

5,010,410



METHOD AND APPARATUS FOR SIGNAL COMPANDING

Lawrence J. Bernstein, Honeoye Falls, N.Y., assignor to Eastman Kodak Company, Rochester, N.Y.

Filed Oct. 16, 1989, Ser. No. 422,348

Int. Cl.[5] H04N *3/36, 5/253*

U.S. Cl. 358—214 6 Claims

3. An apparatus comprising:

a. transport means for transporting film through a film gate;

b. illumination means for passing light through said film gate and focusing said light onto at least one light sensitive device that generates an output light signal;

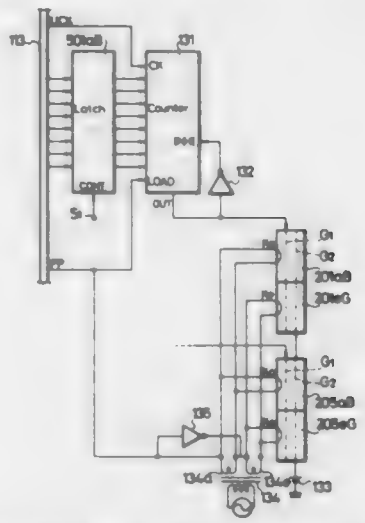
c. selection means for selecting the type of film to be transported through said film gate by said transport means and generating a film type signal indicative thereof;

d. companding means for receiving said output light signal and said film type signal, and generating an output signal having a transfer curve that corresponds to said film type signal wherein said companding means includes a summing circuit, a logarithmic amplifier coupled to said summing circuit, and a feedback circuit coupled to said summing circuit and an output of said logarithmic amplifier, and wherein said feedback circuit includes a compression ratio adjustment circuit that generates a reference signal corresponding to a selected transfer curve in response to said film type signal; and

e. processing means for receiving said output signal generated by said companding means and producing a video output signal.

5,010,411

VIDEO DISPLAY SYSTEM



Satoshi Shimada, Kanagawa, and Yuji Watanabe, Tokyo, both of Japan, assignors to Sony Corporation, Tokyo, Japan

Filed Jan. 30, 1986, Ser. No. 824,236

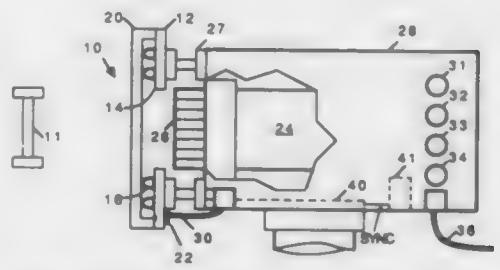
Claims priority, application Japan, Jan. 31, 1985, 60-017129

Int. Cl.[5] H04N *5/66*

U.S. Cl. 358—230 4 Claims

1. A video display system comprising: a video signal source for supplying a video signal; a plurality of display cells arranged in rows and columns in an X-Y matrix form; and a plurality of driving circuits for driving said plurality of display cells in response to said video signal, characterized in that each of said driving circuits is provided to commonly drive a plurality of said display cells adjacent to each other in the column direction, and switching means provided for switchably activating different ones of said plurality of said display cells cyclically at a field rate of said video signal, wherein said plurality of the display cells adjacent to each other are two neighboring display cells in the column direction, and wherein each of said driving circuits includes a scanning converter for doubling the vertical frequency of said video signal; and a pulse width modulation circuit responsive to said converted video signal for deriving a PWM signal corresponding to the brightness level of said converted video signal.

5,010,412



HIGH FREQUENCY, LOW POWER LIGHT SOURCE FOR VIDEO CAMERA

Gregory M. Garrias, Federal Way, Wash., assignor to The Boeing Company, Seattle, Wash.

Filed Dec. 27, 1988, Ser. No. 290,581

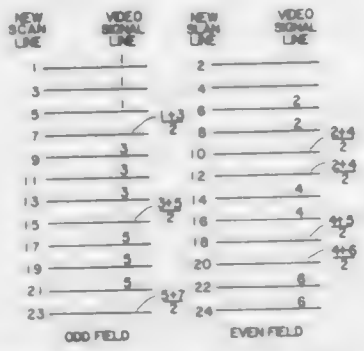
Int. Cl.[5] H04N *3/12, 7/18*

U.S. Cl. 358—240 13 Claims

1. A light source for providing illumination of an object, said light source comprising:

a diode for emitting light when energized;

means for periodically energizing said diode with an adjustable frequency and duty cycle such that said diode emits a sequence of light flashes illuminating said object; and



enabling means for selectively enabling and disabling said means for periodically energizing said diode, said enabling means being operatively responsive to a synchronization signal.

5,010,413

METHOD AND APPARATUS FOR DISPLAYING AN ENLARGED IMAGE ON MULTIPLE MONITORS TO FORM A COMPOSITE IMAGE

Edward Bahr, Maywood, N.J., assignor to Imtech International, Inc., New York, N.Y.

Filed Oct. 10, 1989, Ser. No. 419,094
Int. Cl.[5] H04N 5/68
U.S. Cl. 358—242 11 Claims

1. A method for displaying an image from video signals, comprising the steps of:

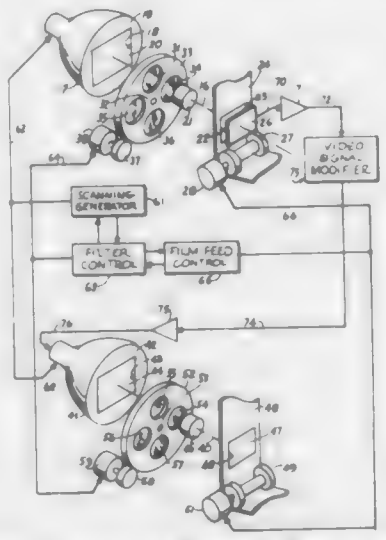
generating video signals indicative of an interlaced image, said video signals containing video field data in two interlaced fields, each of said fields comprising successively occurring video line data;

enlarging the image by replicating the video line data;

determining where replications of the video line data of each of the interlaced fields would result in distortion between the two interlaced fields;

providing a selected combination of video line data in place of the replications which would result in said distortion; and

displaying the enlarged image on a plurality of monitors each having successively occurring scan lines so that each of the monitors displays at most a respective portion of the enlarged image which is less than an entirety of the enlarged image and so that a composite of each portion displayed on the monitors together constitute the enlarged image, the step of displaying including interlacing the successively occurring scan lines for each respective one of said monitors, forming display signals for the video line data including that which was replicated and that which was provided, and correlating said display signals with said scan lines for the monitors so that each monitor will display only the respective portion of the enlarged image.



5,010,414

PROCESS ELIMINATING THE USE OF A MASTER POSITIVE FILM FOR MAKING A DUPLICATE NEGATIVE OF A COLOR MOTION PICTURE

Roy A. Clapp, 2505 S. Kiwanis Ave., Sioux Falls, S. Dak. 57105

Filed Nov. 27, 1985, Ser. No. 802,511
Int. Cl.[5] H04N 5/87, 5/253
U.S. Cl. 358—244 7 Claims

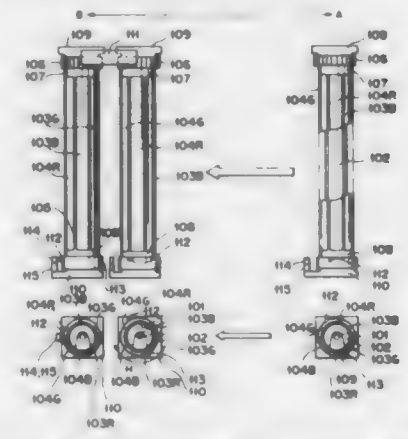
1. The process of making a duplicate color motion picture negative from an original motion picture negative, comprising, an exposure cycle including the steps of generating an analog electrical signal corresponding to a single dye layer of a frame of the original color motion picture negative by projecting one or more scanning cycles of a continuous raster pattern formed upon a first monochromatic cathode ray tube, through a first optical filter restricting the light energy to a predetermined wave length band, focusing said raster pattern on a single frame of the original negative and thence to a photo sensor, supplying said analog signal to a second monochromatic cathode ray tube to simultaneously display a positive image thereon, precise synchronism of the raster patterns insured by providing both cathode ray tubes a common deflection source, and finally projecting the positive image through a second filter adapted to substantially restrict exposure to a single emulsion layer corresponding to the dye layer of the original negative being scanned, and onto a photosensitive surface of an unexposed color motion picture film; changing first and second optical filters and repeating the exposure cycle until the latent images of all duplicate negative emulsion layers are completed

for said frame; advancing both negative and photosensitive films one frame and repeating the above process steps until the complete negative is copied; and finally chemically processing the photosensitive film to form a duplicate negative suitable for release printing, wherein the scanning cycles consist of a raster pattern formed by a continuously energized electron beam traversing a path, starting at one corner of the field of the cathode ray tube, proceeds along a path parallel to one edge of the field until it completes its passage to the opposite end of said path, then moves a distance approximately equal to the electron beam diameter at right angles, then proceeds along a path parallel to its previous movement, repeating this pattern until the complete field has been covered, whereupon the beam retraces the foregoing pattern in a reverse direction to return to its starting point.

5,010,415

IMAGE FORMING APPARATUS HAVING SWITCHABLE COLOR SEPARATION FILTER UNITS

Makoto Suzuki, Nagoya, Japan, assignor to Brother Kogyo Kabushiki Kaisha, Japan



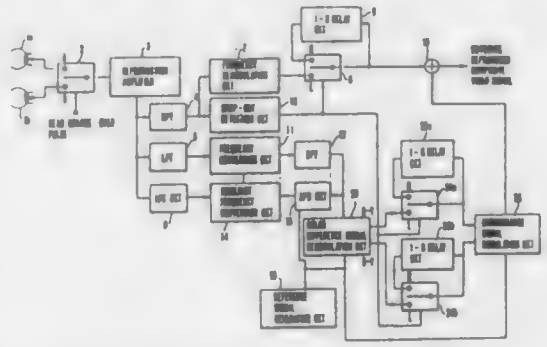
Filed Aug. 21, 1990, Ser. No. 570,545
Claims priority, application Japan, Aug. 24, 1989, 1-217822
Int. Cl.[5] G03F 3/06; H04N 1/29; G01D 15/14
U.S. Cl. 358—302 6 Claims

1. An image forming apparatus for forming a mask member on the basis of a color image information and exposing a photosensitive recording medium to light through the mask member to thereby forming a color image, including:

a light source for emitting light;

at least two color separation filter units for passing the light therethrough and providing transmitted lights having different half-widths in wavelength to thereby. irradiate the light having a desired half-width in wavelength to the photosensitive recording medium;

a position detecting unit for detecting each position of said color separation filter units; and



a switching unit for performing a switching operation between said color separation filter units to position desired one of said color separation filter units in an optical path of the light.

5,010,416

COLOR VIDEO SIGNAL REPRODUCING APPARATUS

Hiroto Yasumura; Masahide Hirasawa; Minoru Noji, all of Kanagawa, Japan; Susumu Kozuki, Tokyo; Koji Takahashi, and Katsuji Yoshimura, both of Kanagawa, all of Japan, assignors to Canon Kabushiki Kaisha, Tokyo, Japan

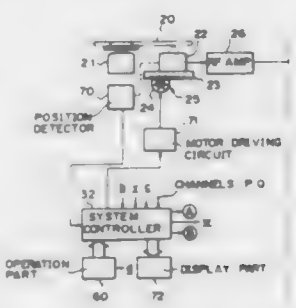
Division of Ser. No. 39,085, Apr. 16, 1987, Pat. No. 4,896,219.
This application Oct. 11, 1989, Ser. No. 420,764
Claims priority, application Japan, Apr. 23, 1986, 61-093978; Apr. 23, 1986, 61-093979; May 12, 1986, 61-107983; May 12, 1986, 61-107984; May 12, 1986, 61-107986
Int. Cl.[5] H04N 9/88
U.S. Cl. 358—314 4 Claims

1. A video signal reproducing apparatus for reproducing a composite video signal from a record bearing medium on which the composite video signal is recorded, said composite video signal being formed, from a color video signal including at least a luminance signal and a chrominance signal, by frequency-modulating said luminance signal, frequency-converting said chrominance signal into a signal having a lower frequency band than its original frequency band and then frequency-multiplexing the both signals, comprising:

(a) reproducing means for reproducing said composite video signal from said record bearing medium;

(b) separating means for separating the frequency-modulated luminance signal and the frequency-converted chrominance signal from said composite video signal reproduced by said reproducing means outputting the separated signals, respectively;

(c) demodulating means for demodulating the frequency-converted chrominance signal outputted from said separating means into a plurality of different base-band signals and for outputting these signals, respectively; and



(d) drop-out compensating means for applying drop-out compensation to said plurality of different base-band signals outputted from said demodulating means.

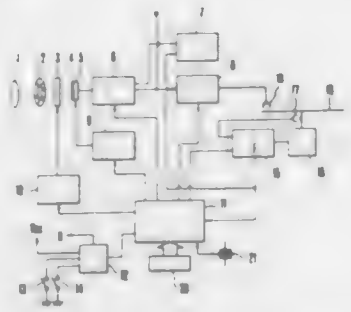
5,010,417

PLAYBACK METHOD FOR USE IN A RECORDING MEDIUM PLAYING APPARATUS USING INFORMATION CONTROL SIGNALS

Junichi Yoshio; Sumio Hosaka; Hisao Matsuoka; Yoshichiro Tsuda; Shoichi Katagiri, all of Tokorozawa, and Satoru Nomura, Yamanashi, all of Japan, assignors to Pioneer Electronic Corporation, Tokyo, Japan

Filed Dec. 21, 1988, Ser. No. 287,148
Claims priority, application Japan, Apr. 25, 1988, 63-102177
Int. Cl.[5] H04N 5/76
U.S. Cl. 358—335 5 Claims

1. A playback method for use in an apparatus for playing a recording medium having an index code area, a first area in which only an audio information signal is recorded, and a second area in which a video signal and an audio information signal are recorded by using a multiplexing operation, said playback method comprising the steps of:



reading information recorded in said index code area in response to a command;

detecting, from information recovered from said index code area, information indicating the presence of picture data which indicates that a code including picture information is inserted as a subcode of said audio information signal;

moving a pickup to a position for reading information of said first area of said recording medium when said information indicating the presence of picture data is detected; and

reproducing information of said first area in priority to reproducing information of other areas of said recording medium.

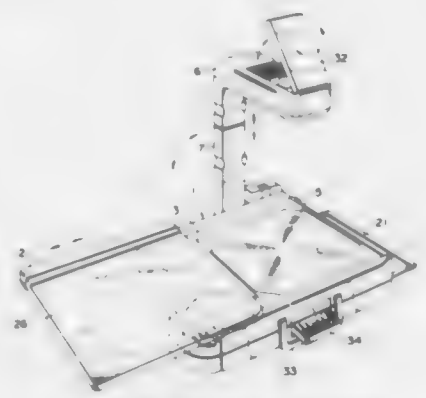
IMAGE PICK-UP DEVICE
Takao Kinoshita, Tokyo; Akihiko Tojo, Kanagawa; Tsutomu Takayama, Kanagawa; Toshio Kaji, Kanagawa, and Nobuyoshi Tanaka, Kanagawa, all of Japan, assignors to Canon Kabushiki Kaisha, Tokyo, Japan
Continuation of Ser. No. 274,703, Nov. 15, 1988, Pat. No. 4,910,606, which is a continuation of Ser. No. 195,492, May 18, 1988, abandoned, which is a continuation of Ser. No. 860,513, May 7, 1986, Pat. No. 4,783,204, which is a continuation of Ser. No. 452,500, Dec. 23, 1982, Pat. No. 4,599,657. This application Jan. 2, 1990, Ser. No. 459,564
Claims priority, application Japan, Dec. 29, 1981, 56-215333; Dec. 29, 1981, 56-215337; Dec. 29, 1981, 56-215342; Dec. 29, 1981, 56-215343; Dec. 29, 1981, 56-215344; Dec. 29, 1981, 56-215345
Int. Cl.[5] H04N *5/76*
U.S. Cl. 358—335 8 Claims

1. An image pick up device comprising:
(a) charge-transferable solid-state image pick-up means, having a light sensing part and a shaded storage part, said light sensing part having a photoelectric transducing ability and capable of holding temporarily an electrical image information formed in the light sensing part by transferring it to the storage part;
(b) control means for controlling the transfer of the electrical image information in the solid-state image pick-up means; and
(c) light shading means for shading the light sensing part at least during the time for transferring the electrical information in the light sensing part of the solid-state image pick-up means to the storage part.



5,010,419
APPARATUS FOR STORING VIDEO SIGNALS ON AUDIO CASSETTE
Thomas Heidt, Long Valley, N.J., and James C. Wickstead, Pitney Rd. and W. Main, Mendham, N.J. 07945, assignors to James C. Wickstead, Mendham, N.J.
Continuation of Ser. No. 938,087, Dec. 4, 1986, Pat. No. 4,875,107. This application Jul. 23, 1989, Ser. No. 378,749
Int. Cl.[5] H04N *5/782*
U.S. Cl. 358—335 19 Claims

1. A video apparatus for storing video images on a recording medium comprising:
camera means for converting light images into electrical video signals;
processing means coupled to the camera means including means for converting the electronic video signal into a low bandwidth frequency modulated analog storage signal with a bandwidth substantially lower than a standard television video signal; and
recording means coupled to the processing means for storing the low bandwidth frequency modulated analog storage signal on an audio cassette having a standard speed allowing storage of an audio bandwidth signal, the recording means including drive means for driving the audio cassette at higher than normal speed to increase the bandwidth storage capacity of the audio cassette and recording head

means for storing the low bandwidth frequency modulated analog storage signal on the audio cassette.

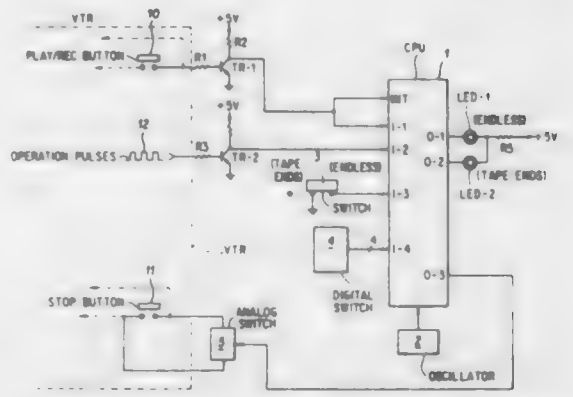
Claims priority, application Japan, Oct. 31, 1988, 63-275789; Oct. 31, 1988, 63-275790; Oct. 31, 1988, 63-142163[U]; Oct. 31, 1988, 63-142164[U]; Oct. 31, 1988, 63-142165[U]; Oct. 31, 1988, 63-142166[U]; Oct. 31, 1988, 63-142167[U]; Oct. 31, 1988, 63-142168[U]
Int. Cl.[5] H04M *1/40*
U.S. Cl. 358—471 7 Claims

1. An image processing apparatus comprising:
(a) an input unit for inputting an image of an initial original in terms of image signals;
(b) a support table on which the initial original is to be set, said support table being movably mounted along said input unit;
(c) an image processing unit for processing the image signals from said input unit;
(d) an image forming unit for forming on a continuous sheet a subject image according to the image signals processed by said image processing unit to provide an OHP original;
(e) a reflection-type focusing plate on which the OHP original is to be set, said reflection-type focusing plate being movably disposed alongside said input unit;
(f) a projecting unit disposed above said reflection-type focusing plate for projecting the subject image of the OHP original set on said reflection-type focusing plate; and
(g) means for detecting the movement of said support table



or said reflection-type focusing plate to deenergize said projecting unit.

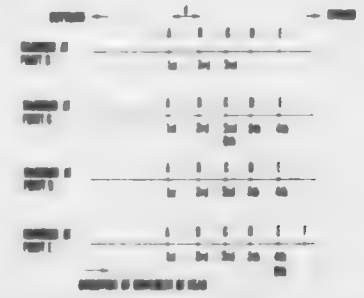
VARIABLE SPEED SOUND REPRODUCING APPARATUS FOR SOUND REPRODUCTION AND REVIEW SYSTEM
Takeshi Arai, Saitama, Japan, assignor to Sanyo Electric Co., Ltd., Osaka, Japan
Filed Dec. 15, 1988, Ser. No. 284,878
Claims priority, application Japan, Dec. 16, 1987, 57-319321
Int. Cl.[5] G11B *5/09*
U.S. Cl. 360—32 3 Claims



1. A sound reproducing apparatus comprising:
means (1, 2, 3, 4, 5, 6, 7, 8) for scanning a recording media having at least a sound signal recorded thereon at a predetermined recording speed, in the direction opposite to that at the time of recording at a reproducing speed N (N: positive integer) times said predetermined recording speed to reproduce said sound signal,
memory means (12) to which and from which a digital signal can be written and read out,
read address generating means (15, 17, 20) for generating a read address signal changed in one direction in a predetermined cycle for specifying an address at which the digital signal is to be read from said memory means,
means (15, 16, 18, 19) for generating address information changed in the direction opposite to that of said read address signal at a speed N times that of said read address signal,
address generating means (21, 22) for supplying said address information as a write address signal for specifying an address at which the digital signal is to be written to said memory means in a cycle corresponding to N/(N+1) times said predetermined cycle of said read address signal and only during a first period corresponding to 1/(N+1) times said predetermined cycle of said read address signal,
address supplying means (17, 18, 23, 26) for supplying said read address signal to said memory means when said read address signal is generated and supplying said write address signal to said memory means when said write address signal is generated during the first period,
means (9, 10, 11, 15) for converting the sound signal reproduced by said reproducing means into a digital signal at a first speed proportional to said reproducing speed and writing the same to the address specified by said write address signal in said memory means, and
means (13, 14, 15) for reading out said digital sound signal from the address specified by said read address signal in said memory means at a second speed proportional to said recording speed and converting the same into an analog signal.

5,010,422
DRIVING SYSTEM FOR ENDLESS VIDEO TAPE BY ONE-TOUCH TIMER
Kazuo Hashimoto, Tokyo, Japan, assignor to Hashimoto Corporation, Tokyo, Japan
Filed Feb. 21, 1990, Ser. No. 483,034
Claims priority, application Japan, Feb. 24, 1989, 1-44255
Int. Cl.[5] G11B *15/18, 19/02*
U.S. Cl. 360—69 10 Claims

1. A driving system for an endless video tape comprising:
a video tape recorder (VTR);
a one-touch timer which is preset by a predetermined one-touch operation; and
control means for driving the VTR in response to the one-touch timer, including means for automatically stopping the VTR if a set time of a predetermined period of said one-touch timer elapses during a driving operation of the VTR, and means responsive to a change in a VTR operation mode to any other mode during said driving, for automatically extending the set time of said one-touch timer for the predetermined period of time and stopping the VTR after said predetermined period of time elapses.

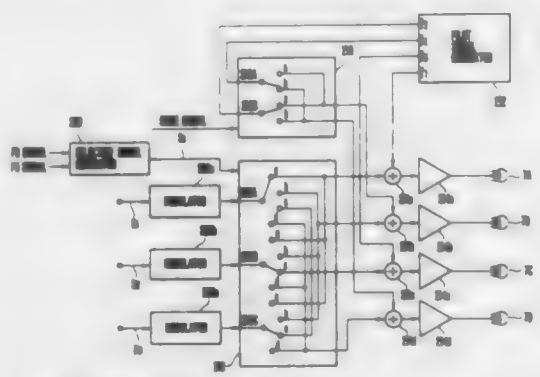
TRACKING DEVICE AND METHOD
Yuji Sakaegi, Tokyo, and Nobuo Fukushima, Kanagawa, both of Japan, assignors to Canon Kabushiki Kaisha, Tokyo, Japan
Continuation of Ser. No. 51,479, May 18, 1987, abandoned. This application Nov. 27, 1989, Ser. No. 442,383
Claims priority, application Japan, May 21, 1986, 61-116954
Int. Cl.[5] G11B *5/596*
U.S. Cl. 360—77.06 12 Claims

1. An automatic tracking device for detecting a level of a signal reproduced from a track on a recording medium by a reproducing head and tracking said head to a position at which the signal takes the maximum level, comprising:
(a) indicating means for indicating a target track;
(b) detecting means operating in such a manner that, prior to the detecting of a signal for the logical central position of said target track, signals for positions front and rear adjacent to said logical central position of said target track,

respectively, are detected, and, after that, the signal for the logical central position of said target track is detected; and



(c) discriminating means for determining the best position of said head based on the signals detected at all the aforesaid positions of said head, said discriminating means being arranged to determine a direction for a location of said best position of said head based on said detected signals in the case where said best position of said head is not determined based on said outputs and to displace said head for a predetermined distance in said direction, and to set the position of the head displaced for said predetermined distance in said direction as a new central position and determine the best position of said head on the basis of signals detected at positions front and rear adjacent said new central position and at said new central position.

5,010,424

RECORDING APPARATUS FOR AN INFORMATION SIGNAL WITH A PLURAL KINDS OF PILOT SIGNALS USING A PLURALITY OF HEADS

Masahide Hasegawa; Mitsuhiro Otokawa, both of Kanagawa; Hidetoshi Matsuoka, Tokyo, and Noritsugu Hirata, Kanagawa, all of Japan, assignors to Canon Kabushiki Kaisha, Tokyo, Japan

Division of Ser. No. 34,793, Apr. 3, 1987, Pat. No. 4,897,739.

Claims priority, application Japan, Apr. 7, 1986, 61-078393; Apr. 9, 1986, 61-080146; Apr. 9, 1986, 61-080147; Jun. 23, 1986, 61-144713; Jun. 23, 1986, 61-144714
Int. Cl.[5] G11B 5/588
U.S. Cl. 360—77.140 7 Claims

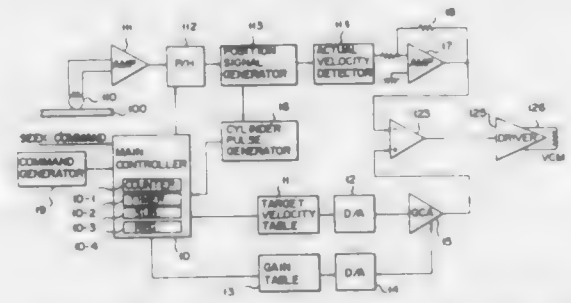
1. A recording apparatus, comprising:

(a) a cylinder member having n rotary heads (where n is an integer of not less than 3) on its outer peripheral surface to rotate with a phase difference of (360/n)° from each other;

(b) a tape guide member training a tape-shaped recording medium around said cylinder member over an angular range of not less than (360(n − 1)/n)°;

(c) producing means for producing n kinds of pilot signals having different frequencies from one another;

(d) input means for inputting an information signal;



(e) recording means for recording said n kinds of pilot signals and said information signal on the medium, said recording means including first supply means for supplying said information signal to said n rotary heads in turn, and second supply means for supplying said n kinds of pilot signals to said n rotary heads, each of said n kinds of pilot signals unchangeably supplying only a predetermined one of said n rotary heads.

ACCESS CONTROLLER FOR CONTROLLING THE SEEK OPERATION OF A HEAD RELATIVE TO A RECORDING MEDIUM

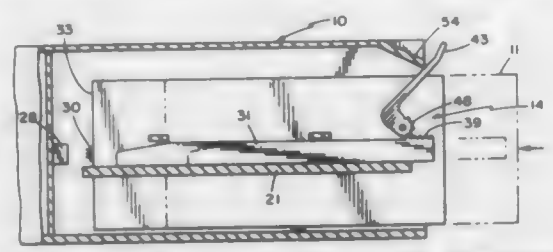
Kenji Asai, Oome, Japan, assignor to Kabushiki Kaisha Toshiba, Kawasaki, Japan

Filed Apr. 5, 1989, Ser. No. 333,279
Claims priority, application Japan, Apr. 6, 1988, 63-84770
Int. Cl.[5] G11B 5/55
U.S. Cl. 360—78.04 15 Claims

1. An access controller for a recording medium, comprising:

an access mechanism having at least one head, for moving said head relative to said recording medium in accordance with an input velocity difference signal;

driving means responsive to an input seek command, for generating a primary velocity signal in accordance with a distance from a current position of said head to a destination cylinder designated by the seek command, amplifying the primary velocity signal in accordance with input gain data to obtain a target velocity signal, generating an actual velocity signal from position data readout from said recording medium by said head while said head is moved, and generating the velocity difference signal from the target velocity signal and the actual velocity signal to output the velocity difference signal to said access mechanism; and



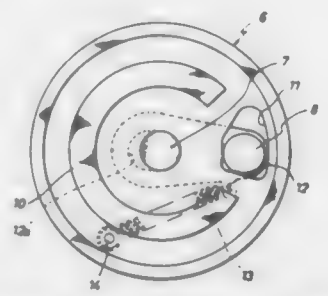
determination means responsive to an input adjustment command, for determining the gain data and outputting the gain data to said driving means.

5,010,426

INSTALLATION MECHANISM FOR REMOVABLE COMPUTER DRIVE MODULE

Horst M. Kreaz, Bridgman, Mich., assignor to Zenith Data Systems Corporation, Mt. Prospect, Ill.

Filed Feb. 3, 1989, Ser. No. 306,613
Int. Cl.[5] G11B 17/04
U.S. Cl. 360—97.01 12 Claims



1. A computer component with removable drive module, comprising: a computer component housing including an opening with stationary module guide means, a terminal connector in the housing opening, a drive module removably received in the opening and guided therein by the guide means, having a connector fixed thereto releasably engageable with the housing connector, and an installation assembly for engaging the two connectors and holding the module in position in the housing including an automatically engaging handle operated interengaging drive means having a portion thereof on the housing interengaging a portion thereof on the module including means to automatically engage and operate the drive by module movement without handle pressure as the module is pushed along the housing guide means toward a position where the connectors engage so the handle may thereafter be operated to move the connectors to their final engaged positions.

5,010,427

APPARATUS FOR POSITIONING A MAGNETIC DISK ON A DISK DRIVE

Katsuhiko Taguchi, and Kazuya Mitsumori, both of Chofu, Japan, assignors to Juki Corporation, Chofu, Japan

Continuation of Ser. No. 767,090, Aug. 19, 1985, Pat. No. 4,873,595. This application Jun. 30, 1989, Ser. No. 374,964
Claims priority, application Japan, Aug. 23, 1984, 59-175784
Int. Cl.[5] G11B 5/012
U.S. Cl. 360—99.05 11 Claims

1. Apparatus for positioning a magnetic disk upon a magnetic disk drive which includes a motor drive spindle and a turntable fixedly mounted upon said spindle, comprising:

a driving pin;

biasing means for biasingly mounting said driving pin upon said motor drive spindle so as to be movable in both radial and circumferential directions relative to said spindle and said turntable;

means for urging said driving pin toward said spindle;

means for defining a first hole within said magnetic disk within which said motor drive spindle is to be disposed;

means for defining a second hole within said magnetic disk within which said driving pin is to be disposed; and

means for defining a positioning third hole within said turntable for cooperating with said means defining said second hole so as to confine said driving pin between said means for defining said second hole and said means for defining said third hole whereby said magnetic disk will be properly positioned upon said magnetic disk drive.

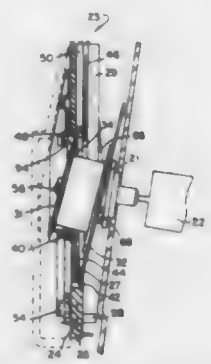
TILTING OPTICAL DISC LOADING MECHANISM WITH AUTOMATIC CENTERING AND EJECTION OF DISCS OF DIFFERENT DIAMETERS

Stephane M. d'Alayerde Costemore d'Arc, Brussels, Belgium, assignor to Staar S.A., Belgium

Filed Sep. 26, 1989, Ser. No. 412,478
Claims priority, application Belgium, Nov. 17, 1988, 8801303
Int. Cl.[5] G11B 17/04
U.S. Cl. 360—99.06 24 Claims

1. A disc player/recorder apparatus comprising:

a frame,



a horizontal spindle on said frame adapted to receive a disc on one end of said spindle in a vertical operating plane, and

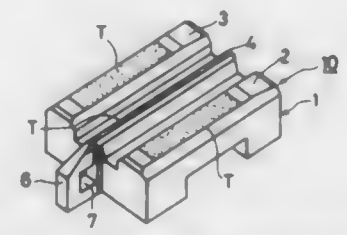
a loading and centering device for discs of different diameters including:

a loading member pivotally mounted to said frame for movement between an introduction position and an operating position, said member having a disc loading surface,

guides on said loading surface which engage lateral edges of a disc of a first diameter or of a second smaller diameter and guide either diameter disc along different parallel loading planes to a location substantially centered laterally with respect to the end of the spindle,

positioning elements on said loading surface which engage a lower edge of a disc of the first diameter or of the second diameter and position either diameter disc in a location substantially centered vertically with respect to the end of

the spindle upon movement of said loading member between the introduction position and the operating position whereby the disc is translated between an introduction plane tilted upwardly and away from the vertical operating plane, and is returned to the introduction plane upon return movement of said loading member, and



clamping means carried by said loading member for clamping a disc on the end of said spindle in the vertical operating plane when said member is in the operating position.

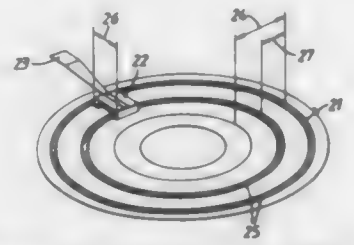
FLOATING MAGNETIC HEAD HAVING IMPROVED STATIC FRICTION COEFFICIENT

Akira Taguchi; Shigetoshi Morita; Shunichi Taka; Hirohide Yamada; Yoshiaki Takada; Shinji Furuichi, and Masahiro Ao, all of Mooka, Japan, assignors to Hitachi Metals, Ltd., Tokyo, Japan

Filed Jun. 1, 1989, Ser. No. 360,124
Claims priority, application Japan, Nov. 22, 1988, 63-295652
Int. Cl.[5] G11B 5/60
U.S. Cl. 360—103 8 Claims



1. A magnetic head comprising: a slider made of a polycrystalline ceramic material; and a magnetic core, said slider having a surface to be opposed to a magnetic disk, said opposed surface being formed of lands and grooves having a height difference of 50 to 200 A on an average and a repetition pitch of 5 to 20 microns on an average.

5,010,430

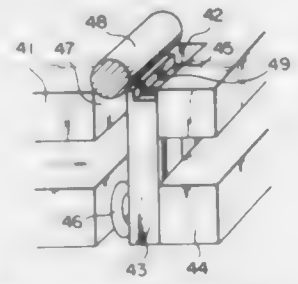
HEAD SLIDER ARRANGEMENT FOR MAGNETIC DISK STORAGE DEVICE

Takehito Yamada, Kanagawa; Kazushi Tanimoto, Tokyo; Yuji Sakai; Takao Muraoka, both of Kanagawa; Tetsuo Inoue, Chiba, and Yoshinao Takada, Kanagawa, all of Japan, assignors to Kabushiki Kaisha Toshiba, Kawasaki, Japan

Filed Jul. 29, 1988, Ser. No. 226,062
Claims priority, application Japan, Jul. 30, 1987, 62-191410; Aug. 13, 1987, 62-202236; Dec. 11, 1987, 62-311884
Int. Cl.[5] G11B 5/60, 5/596
U.S. Cl. 360—103 21 Claims

1. A magnetic disk storage device, comprising:
a magnetic disk having a disk surface including an inner side and an outer side with a storing/reproduction region formed thereon;
a head slider facing the disk surface and having a plurality of parallel projections to generate an air bearing, including an inner floating value and an outer floating value;
a plurality of magnetic heads, each having a head gap in one of said projections; and
means for compensating differences of said floating values of said magnetic heads based on circumferentially different speeds on the inner side and the outer side of the disk surface.

21. A magnetic disk storage device, comprising:
a magnetic disk having a disk surface with a storing/reproduction region including a servo region formed thereof, said storing/reproducing region having a width, said servo region storing coarse servo signal and a fine servo signal;
a head slider facing the disk surface and having a plurality of parallel projections to generate an air bearing;
two magnetic heads each having a head gap in one of said projections and having an interval between head gaps of at least one half of the width of the storing/reproduction region of the disk;
a coarse servo positioning signal detector circuit detecting the coarse servo signal obtained by an inner head;
a fine servo positioning signal detector circuit detecting the fine servo signal obtained by an outer head;
a positioning control circuit controlling the position of the head using outputs of said detector circuits.



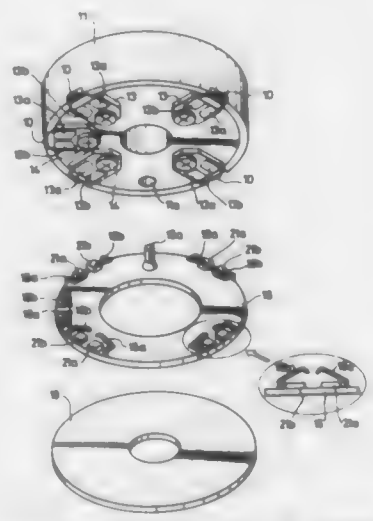
5,010,431

FLYING-TYPE COMPOSITE MAGNETIC HEAD

Tadashi Shinohara, Chiyoda; Toshikazu Nishiyama, Fukaya; Kazumi Nogachi, Kamikawa; Hitoshi Iwata, and Shigekazu Suwabe, both of Kumagaya, all of Japan, assignors to Hitachi Metals, Ltd., Tokyo, Japan

Filed Jan. 27, 1989, Ser. No. 302,419
Claims priority, application Japan, Jan. 28, 1988, 63-18382
Int. Cl.[5] G11B 5/60
U.S. Cl. 360—103 23 Claims

1. A flying-type composite magnetic head comprising:
(a) a slider made of a non-magnetic ceramic material and having side rails extending longitudinally on both lateral sides of said head, one of said rails having a slit extending longitudinally therein; and
(b) a magnetic core fixable in said slit and including—
(i) a pair of core pieces having flat opposing surfaces parallel to each other for defining a magnetic gap,
(ii) an Fe-Al-Si thin layer formed on one of said flat opposing parallel surfaces of said core pieces,
(iii) a first glass layer for bonding said pair of core pieces together,
(iv) a second glass layer for fixing said magnetic core in said slit, said second glass layer filling the slit on sides of said magnetic core, and



(v) a track surface on said magnetic core having a track width defined by a notch longitudinally formed in said magnetic core, said magnetic gap and said notch having depths wherein the depth of the notch is equal to or greater than the depth of said magnetic gap, and said magnetic core having a thickness and said first glass layer having a remaining thickness after bonding of the core pieces and forming of the notch wherein the remaining thickness of said first glass layer is equal to or greater than the thickness of said magnetic core.

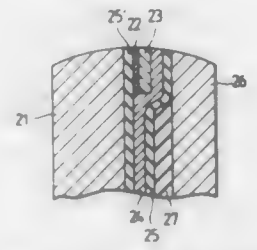
ROTARY HEAD DRUM APPARATUS COMPRISING RESILIENT ELECTRICAL CONNECTORS

Hideo Fukushima, Tokyo, and Masakazu Kurashima, Kanagawa, both of Japan, assignors to Sony Corporation, Tokyo, Japan

Filed Jun. 26, 1989, Ser. No. 371,293
Claims priority, application Japan, Jun. 28, 1988, 63-159942; Jun. 28, 1988, 63-159943; Jun. 28, 1988, 63-159944
Int. Cl.[5] G11B 5/52, 15/60
U.S. Cl. 360—108 10 Claims



1. In a rotary head drum apparatus in which at least one magnetic head is attached to a rotary drum member for rotation relative to a stationary structure, and a rotary transformer is provided for transmitting electrical signals between said magnetic head and said stationary structure and includes a rotor and a stator fixed relative to said rotary drum member and said stationary structure, respectively, and having respective coils; means for connecting said at least one magnetic head to the coil of said rotor of the rotary transformer comprising:
resilient electrical contactor means;
means for mounting said resilient electrical contactor means on one of said rotary drum member and said rotor; and
electrical contact portion means;
means for mounting said electrical contact portion means on the other of said rotary drum member and said rotor for contact with said electrical contactor means, and wherein said electrical contactor means is urged resiliently against said electrical contact portion means in response to assembling together of said rotary drum member and said rotary transformer; and
means electrically connecting said at least one magnetic head with one of said electrical contactor means and said electrical contact portion means which is mounted on said rotary drum member, whereby an electrical path is established between said at least one magnetic head and said rotor.

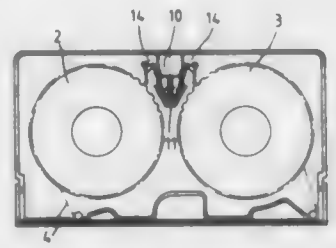
5,010,433

MAGNETORESISTIVE MAGNETIC HEAD HAVING A SHUNT FILM OF NB

Masahiro Kitada, Hamura; Noboru Shimizu, Tokorozawa; Hideo Tanabe, Higashi-murayama, and Hitoshi Nakamura, Hachiouji, all of Japan, assignors to Hitachi, Ltd., Tokyo, Japan

Filed Feb. 16, 1989, Ser. No. 310,922
Claims priority, application Japan, Feb. 26, 1988, 63-41987
Int. Cl.[5] G11B 5/127
U.S. Cl. 360—113 9 Claims

1. A magnetoresistive magnetic head comprising:
a two-layer film consisting of a magnetoresistive film and a shunt film, the magnetoresistive film being formed of an Ni-Fe alloy film which contains 7 to 27 wt % of Fe and a virtually remaining percentage of Ni, and the shunt film being formed of an Nb film having an electrical resistivity of not more than 30 μΩcm and being deposited by the electron-beam evaporation method.



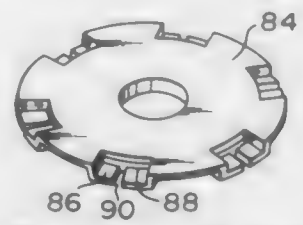
5,010,434

TAPE CASSETTE HAVING A TWO-REEL BRAKE SYSTEM HAVING IDENTICAL BRAKE LEVERS THEREFOR

Klaus Schoettle, Heidelberg; Artur Buhk, Erpolzheim, and Lothar Gliniorz, Frankenthal, all of Fed. Rep. of Germany, assignors to BASF Aktiengesellschaft, Ludwigshafen, Fed. Rep. of Germany

Filed Apr. 14, 1989, Ser. No. 338,093
Claims priority, application Fed. Rep. of Germany, Apr. 23, 1988, 68805416[U]
Int. Cl.[5] G11B 23/02, 15/32
U.S. Cl. 360—132 9 Claims

1. A tape cassette having a two-reel brake system, substantially consisting of an actuating element and two rotatable brake levers which are associated with two reels, mounted with bias on a cassette housing and arranged for actuation by



an actuating element, wherein the brake levers are of identical shape rather than being a mirror image of each other.

5,010,435

HUB FOR A DISK TYPE RECORDING MEDIUM

Haruo Shiba; Masaru Ikebe, and Toshihiko Ishida, all of Komoro, Japan, assignors to TDK Corporation, Tokyo, Japan

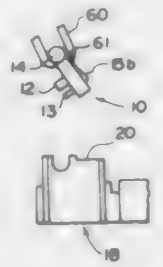
Filed Dec. 2, 1988, Ser. No. 279,090
Claims priority, application Japan, Dec. 3, 1987, 62-184643
Int. Cl.[5] G11B 23/03, 5/84
U.S. Cl. 360—133 1 Claim

1. A hub to be attached to the central portion of a recording medium which comprises:
a flat plate-like body made of a metallic material and including upper and lower surfaces and at least one indentation having a depth sufficiently large to form an aperture between the lower surface of the flat plate-like body and an upper surface of the indentation, the aperture having an outer boundary positioned substantially transversely to at least one of the upper and lower surfaces of the flat plate-like body, and
an annular resinous body firmly attached to said flat plate-like body by insertion-molding such that at least a portion of the annular resinous body extends through the aperture for connection said annular resinous body to said flat plate-like body,
wherein said at least one indentation is divided into two sections, and
wherein in addition to said aperture a slit is formed in at least one indentation in the radial direction.

5,010,436

APPARATUS FOR INCORPORATING LOCK PLATES IN VIDEO CASSETTES

Naoto Takayama, Kanagawa, Japan, assignor to Fuji Photo Film Co., Ltd., Kanagawa, Japan



Filed Sep. 28, 1989, Ser. No. 413,670
Claims priority, application Japan, Sep. 29, 1988, 63-245796; Oct. 4, 1988, 63-130211[U]
Int. Cl.[5] G11B 23/113
U.S. Cl. 360—137 4 Claims

1. An apparatus for incorporating a lock plate in a video cassette, wherein a lock plate composed of:
(a) a sheet-like plate body,
(b) protrusions protruding from the plate body in a direction approximately normal thereto,
(c) a shaft combined integrally with the plate body and

extending adjacent and approximately parallel to the plate body, and

(d) a torsion spring having a coiled portion engaged with the shaft,

is incorporated in a cassette case body of a video cassette in order to allow a guard panel of the video cassette to be locked in a closed position, which video cassette is composed of the cassette case body in which a magnetic tape is accommodated, and the guard panel mounted on a surface of the cassette case body, along which surface the magnetic tape slides,

the apparatus for incorporating a lock plate in a video cassette comprising:

(i) a plate holding means which holds said lock plate in an obliquely inclined orientation so that the surface of said plate body, on which surface said protrusions are formed, faces down obliquely and so that said shaft extends horizontally above said plate body, and

(ii) a fitting means which grasps the lock plate held by said plate holding means, moves it linearly while keeping it in the inclined orientation, and thereby fits said lock plate into said cassette case body.

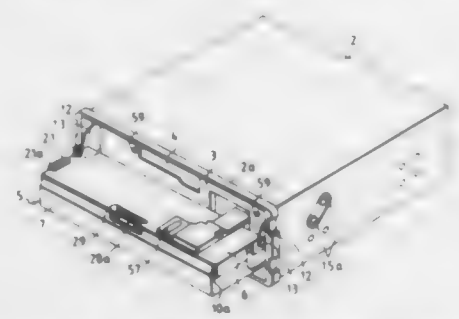
RECORDING MEDIUM PLAYER APPARATUS



Nobuo Utsugi; Hisashi Kihara; Shuichi Mori; Junichi Fuse; Takashi Miyake, and Yoshikatsu Ikata, all of Saitama, Japan, assignors to Pioneer Electronic Corp., Tokyo, Japan

Filed Mar. 6, 1990, Ser. No. 488,826

Claims priority, application Japan, Jun. 7, 1989, 1-144413

Int. Cl.[5] G11B *33/02*

U.S. Cl. 360—137 **7 Claims**

1. A recording medium player apparatus comprising

a housing enclosing a play means and having an insertion slot formed at a front surface portion thereof for insertion of a recording medium carrying an information signal,

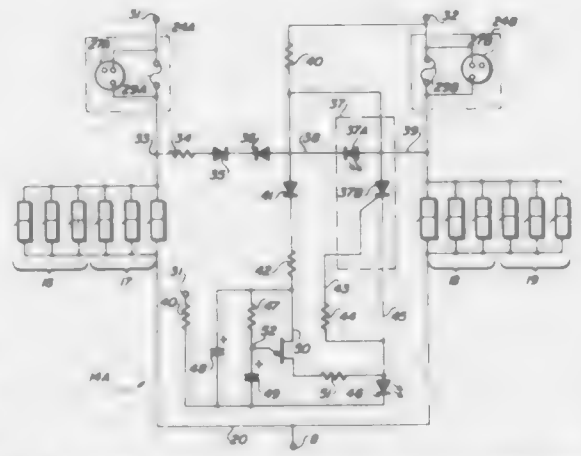
an open/close body disposed so as to openably cover said insertion slot and provided with an operation portion for controlling the operation of said play means, and

further comprising a support member pivotally disposed on said housing for pivotally supporting at a free end portion thereof said open/close body;

a first driving means for pivotally moving said support member; and

a second driving means for pivotally moving said open/-close body relative to said support member.

5,010,438



PLUG-IN TRANSIENT VOLTAGE SUPPRESSOR MODULE

Peter J. Brady, Glendale, Ariz., assignor to Square D Company, Palatine, Ill.

Filed Jun. 16, 1989, Ser. No. 367,028

Int. Cl.[5] H02H *9/06*

U.S. Cl. 361—56 **20 Claims**

1. A surge suppressor module capable of repeatedly suppressing ten kiloampere surges, comprising in combination:

(a) a printed circuit board having a plurality of metal strip conductors thereon, and a plurality of via holes extending through the printed circuit board and through the various metal strip conductors;

(b) an elongated ground bus generally perpendicular to the printed circuit board having an edge soldered to a metal conductor on the printed circuit board;

(c) a first fuse having a first terminal connected to a first power line conductor, and a second terminal, and a second fuse having a first terminal connected to a second power line conductor and also having a second terminal;

(d) a first group of metal oxide varistors each having a first terminal and a second terminal, the first terminal of each of the metal oxide varistors of the first group being connected to the second terminal of the first fuse, the second terminals of the metal oxide varistors of the first group being connected, respectively, by some of the metal strip conductors to the edge of the ground bus by means of the metal conductor, and a second group of metal oxide varistors each having a first terminal and a second terminal, the first terminals of the metal oxide varistors of the second group being connected to the second terminal of the second fuse, the second terminals of the metal oxide varistors of the second group being connected by some of the metal strip conductors to the edge of the ground bus by means of the metal conductor, the metal oxide varistors of the first and second groups being positioned on opposite sides of the ground bus;

(e) a plastic housing adapted to be plugged into a single slot of a power distribution panel enclosing the printed circuit board, the ground bus extending through a first edge wall of the housing;

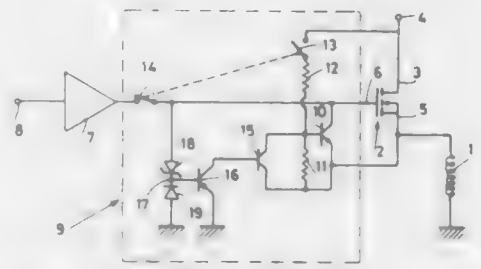
(f) means for connecting an external ground conductor to the ground bus;

(g) first and second conductive prongs extending through a second edge wall of the housing;

(h) first and second means attached to the printed circuit board and electrically connected to the first and second power line conductors for electrically contacting the first and second conductive prongs, respectively.

5,010,439

CONTROL CIRCUIT FOR THE CLAMPING VOLTAGE OF AN INDUCTIVE LOAD DRIVEN BY A POWER DEVICE IN A HIGH SIDE DRIVER CONFIGURATION



Michele Zina, Comiso, and Sergio Palara, Acicastello, both of Italy, assignors to SGS-Thomson Microelectronics s.r.l., Milano, Italy

Filed Jun. 12, 1989, Ser. No. 364,174

Claims priority, application Italy, Jul. 29, 1988, 21561 A/88

Int. Cl.[5] H02H *7/20;* **H03K** *17/60*

U.S. Cl. 361—91 **3 Claims**

1. Control circuit for the clamping voltage of an inductive load driven by a power device having a power supply terminal, a load terminal connected to earth through the inductive load and a control terminal connected to an alternating control signal input, there being provided a discharge circuit for the inductive load which is activated when said clamping voltage is attained, characterized in that it includes a switching element connected between said control terminal and said load terminal and having a control element connected to a voltage supply by first switching means operating in push-pull with second switching means connected between said control terminal and said control signal input and at the latter's same frequency so as to accomplish a direct connection between said control terminal and said load terminal whenever the power device is shut down, said discharge circuit including threshold means having a predetermined firing threshold which are activated when the voltage at the load terminal of the power device falls below earth until it reaches said firing threshold where said threshold means are constituted by a Zener diode connected between said control terminal of the power device and earth by a diode, there being provided means sensitive to the firing of said Zener diode to control the deactivation of said switching element for the subsequent turning on of said power device.

5,010,440

PIPE LINER HAVING ELECTRICALLY CONDUCTIVE WIRES FOR HARDENING AND ELECTROSTATIC BUILD-UP PREVENTION

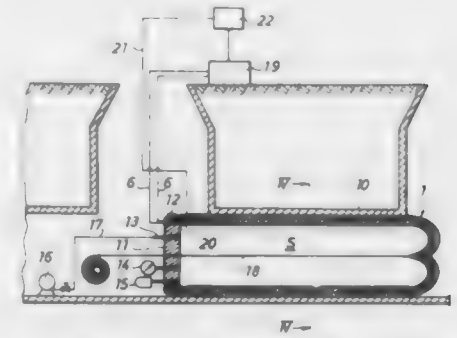
Mamiko Endo, Kita-Kasukabe Haitsu, 368, Umeda, Kasukabe-shi, Saitama-ken, Japan

Filed Dec. 6, 1989, Ser. No. 446,889

Claims priority, application Japan, Dec. 9, 1988, 63-310160

Int. Cl.[5] H05F *1/00;* **F16L** *11/12, 55/18, 55/16*

U.S. Cl. 361—215 **8 Claims**



1. A pipe liner (1) with which a pipe is internally lined, comprising:

a resin-absorbable flexible tube made of electrically conductive material,

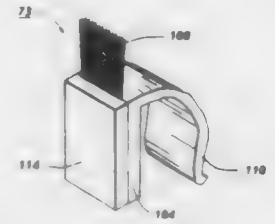
an electrically insulating means which is provided along at least one generatrix of said resin-absorbable flexible tube and penetrating through the whole thickness thereof, so as to electrically disconnect the circumferential circuit formed by said resin-absorbable flexible tube at said at least one generatrix,

a thermosetting resin absorbed in said resin-absorbable flexible tube,

at least one pair of wires having an electrical conductivity greater than that of said resin-absorbable flexible tube, said at least one pair of wires being laid on, and passed along the whole length of, said resin-absorbable flexible tube, and being arranged such that the wires of the same pair are close to each other but are electrically isolated from each other by said electrically insulating means, and

an electrically insulating hermetic film which forms the innermost layer of said pipe liner, when the pipe liner is inserted in the pipe.

5,010,441



GROUNDING BRUSH

Elizabeth D. Fox, Rochester, and Alan G. Schlageter, Ontario, both of N.Y., assignors to Xerox Corporation, Stamford, Conn.

Filed Jan. 24, 1990, Ser. No. 469,873

Int. Cl.[5] H05F *3/02;* **G03G** *21/00*

U.S. Cl. 361—221 **10 Claims**

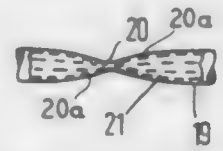
1. A device for electrically conductive rotating shaft, including:

an electrically grounded member;

electrically conductive means, mounted removably on the shaft and rotating therewith to periodically contact said grounded member, for periodically electrically grounding the rotating shaft.

5,010,442

BREAK-AWAY ELEMENT FOR ELECTRICAL CAPACITOR



Werner Erhardt, Baiendorf, Fed. Rep. of Germany, assignor to Siemens Aktiengesellschaft, Berlin and Munich, Fed. Rep. of Germany

Filed May 26, 1989, Ser. No. 357,251

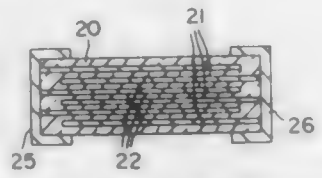
Claims priority, application Fed. Rep. of Germany, May 26, 1988, 3817903

Int. Cl.[5] H01G *1/13*

U.S. Cl. 361—275 **11 Claims**

1. In an electrical capacitor having a housing, an improved

over-pressure break-away element composed of a malleably deformed wire having a rated break location with a smooth surface and a gradual continuous transition from a cross section of said wire to a cross section of said break location



---

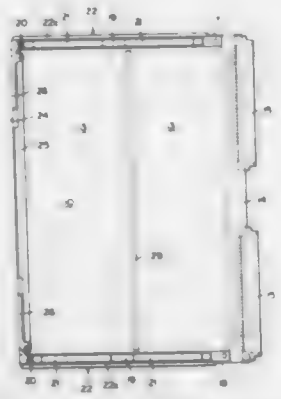
5,010,443

CAPACITOR WITH FINE GRAINED $BATIO_3$ BODY AND METHOD FOR MAKING

Galeb H. Maher, North Adams, Mass., assignor to MRA Laboratories, Inc., North Adams, Mass.

Filed Jan. 11, 1990, Ser. No. 463,705
Int. Cl.[5] H01G 4/12, 7/00; C04B 35/46
U.S. Cl. 361—321 **15 Claims**

1. A monolithic ceramic capacitor comprised of a barium titanate body, two groups of interdigitated electrodes buried in said body and extending respectively to opposite ends of said body, and two conductive terminations contacting said two groups respectively at said opposing body ends:



said body being comprised of sintered barium titanate grains having an average size of from 0.5 to 0.9 micron, and in the grain boundaries from 1.5 to 2.5 weight percent of a silicate flux and a lesser amount of a reactivity-inhibitor compound.

MULTI-EDGE EXTENDER BOARD

Michael B. Scannell, Chicago, Ill., assignor to Commonwealth Edison Company, Chicago, Ill.

Filed Oct. 30, 1989, Ser. No. 428,917
Int. Cl.[5] G01R 31/22
U.S. Cl. 361—398 **34 Claims**

1. For use with a circuit board having first and second adjacent edges with first and second terminal means respectively disposed thereon for coupling said circuit board to circuitry in a support structure in which said circuit board is mounted, apparatus for directly coupling said circuit board to said circuitry with said circuit board removed from said support structure, said apparatus comprising:

a generally planar, rigid substrate having a plurality of edges;

third and fourth terminal means disposed on respective opposed first and second edges of said substrate for coupling the circuitry in the support structure to the circuit board, wherein the apparatus further includes conductive means for electrically coupling said third and fourth terminal means and wherein said third terminal means for coupling to the circuitry in the support structure and said fourth terminal means is for coupling to the first terminal means of the circuit board;

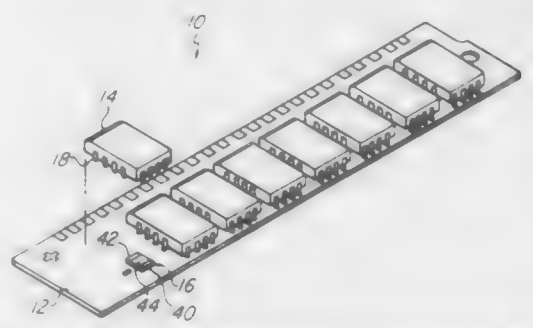
fifth and sixth terminal means respectively disposed on a third edge and on an inner portion of said substrate for coupling the circuitry in the support structure to the circuit board, wherein said third edge is adjacent to the first edge of said substrate and said fifth and sixth terminal means are electrically coupled; and

first coupling means for coupling said sixth terminal means to the second terminal means on the circuit board.

5,010,447

DIVIDED CAPACITOR MOUNTING PADS

James S. Wallace, Sugarland, Tex., assignor to Texas Instruments Incorporated, Dallas, Tex.



Filed Dec. 28, 1988, Ser. No. 290,778
Int. Cl.[5] H05K 7/10
U.S. Cl. 361—400 **10 Claims**

1. An arrangement for surface mounting an electrical component in a desired circuit that is carried on an insulating substrate, the arrangement being testable electrically to indicate the proper mechanical mounting of said component, said arrangement comprising:

A. a first pad carried on said substrate and at which said component is to be mounted, said first pad having two parts electrically insulated from one another and spaced from one another by a certain distance;

B. said component having a first terminal with a dimension of at least said certain distance, said component being mounted to said two parts of said first pad to bridge mechanically and electrically the space between said two parts with said terminal; and

C. one lead in said desired circuit extending to one part of said first pad and another lead in said desired circuit extending to the other part of said first pad to place said component terminal bridging said space between said pad parts in series with said leads so that proper mechanical mounting of said terminal to said two pad parts becomes testable by a series circuit through said leads.

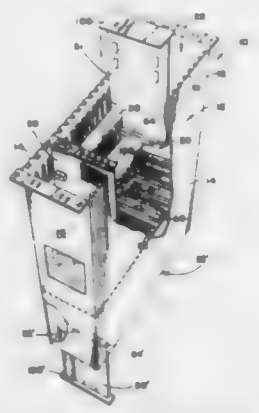
Int. Cl.[5] H05K 1/11
U.S. Cl. 361—414 11 Claims

1. A method for assuring that a multi-layer circuit board has been assembled in a selected order comprising the steps of

forming a label on each layer of the multi-layer circuit board, with each label having a unique indicia thereon indicative of that layers position in a correctly assembled multi-layer circuit board;

forming a semi-transparent area in each layer above the last layer to be viewed, with the size of each semi-transparent area limited to that necessary to view only the indicia of the correctly assembled layers positioned below that particular layer, such that an incorrectly positioned layer prevents the viewing of at least one indicia; and



viewing the assembled multi-layer circuit board to assure the order of said unique indicia.

FRONT-REAR MODULAR UNIT

David A. Werdin, Eagan, and Reinhold Henke, St. Paul, both of Minn., assignors to ADC Telecommunications, Inc., Minneapolis, Minn.

Continuation of Ser. No. 204,751, Jan. 10, 1988. This application Sep. 21, 1988, Ser. No. 247,151
Int. Cl.[4] H05K 7/14
U.S. Cl. 361—415 29 Claims

1. A front and rear modular conversion unit comprising:

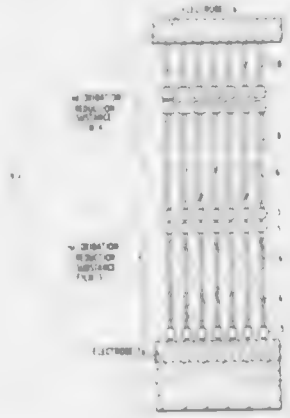
a chassis including four side-walls and open front and rear ends;

a motherboard printed circuit board mounted inside said chassis to form a front module insertion area and a rear module insertion area, said motherboard including a plurality of connectors for receiving a cooperating mating connector, said connectors mounted on both sides of said motherboard;

means for connecting connectors on opposite sides of said motherboard in pairs;

one or more conversion card module means for converting a conditioned electrical signal to a fiber optic signal mounted in the front end of said chassis and mating with said connectors;

one or more rear card module means each for conditioning electrical signals to provide said conditioned electrical signals, said rear card module means mounted in the rear of said chassis and mating with said connectors on said motherboard, said rear card module means including connector means for connecting to an electrical cable carrying signal to be converted by said conversion card module means, and



whereby electrical signals can be connected to said rear card module means, processed on said rear card module means, connected through to said conversion card module means through said connectors on said motherboard, and converted on said conversion card module means.

ELECTRONIC DEVICE

Satoshi Ueyama; Hiroaki Kawakubo; Satoru Isoda, and Mitsuo Maeda, all of Hyogo, Japan, assignors to Mitsubishi Denki K.K., Tokyo, Japan

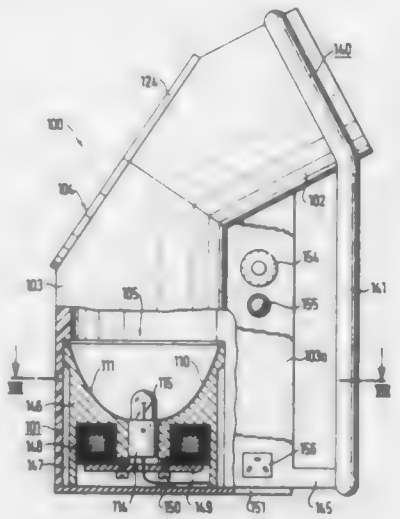
Filed Mar. 28, 1990, Ser. No. 500,347
Claims priority, application Japan, Mar. 29, 1989, 1-79236; Mar. 29, 1989, 1-79237; Mar. 31, 1989, 1-81827
Int. Cl.[5] H01G 9/02; B32B 7/02; A01N 43/38
U.S. Cl. 361—504 12 Claims

1. An electronic device comprising:

a first oxidation-reduction substance film of a first oxidation-reduction substance;

a second oxidation-reduction substance film of a second oxidation-reduction substance having a redox potential different from that of said first oxidation-reduction substance and being accumulatedly contacted and joined on said first oxidation-reduction substance film; and

a first electrode electrically connected to said first oxidation-reduction substance film and a second electrode electrically connected to said second oxidation-reduction substance film;



wherein said first oxidation-reduction substance is composed of one of a flavin derivative and a porphyrin derivative while said second oxidation-reduction substance is composed of another one so as to provide transistor characteristics or switching characteristics by utilizing the difference in redox potential between said first and second oxidation-reduction substances.

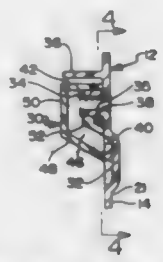
THERAPEUTIC LAMP FOR BIOSTIMULATION WITH POLARIZED LIGHT

Werner Kreiser, Embrach, Switzerland; Michael Lantos, Budapest, and Peter Kolta, Pécs, both of Hungary, assignors to Harrier GmbH Gesellschaft fur den Vertrieb medizinischer und technischer Gerate, Fed. Rep. of Germany

PCT No. PCT/EP88/00900, § 371 Date Apr. 14, 1989, § 102(e) Date Apr. 14, 1989, PCT Pub. No. WO89/03236, PCT Pub. Date Apr. 20, 1989
PCT Filed Oct. 7, 1988, Ser. No. 348,008
Claims priority, application Fed. Rep. of Germany, Oct. 7, 1987, 3733905; Sep. 16, 1988, 88115249
Int. Cl.[5] F21V 9/14
U.S. Cl. 362—19 11 Claims



1. Therapeutic lamp for biostimulation with polarized light, comprising a light source with a power substantially between 30W and 300W and being substantially a point source, a reflector with a rotational paraboloid light reflecting surface defining a focal point arranged behind the light source so that said focal point substantially coinciding with said point source to reflect forward the majority of light emitted by said source in a parallel path, a polarizer arranged in said path to generate polarized output light propagating in a predetermined direction and having a cross-section of at least 100 cm^2, wherein said lamp further comprises a first tube with a first axis coinciding with axis of rotation of said paraboloid surface, said reflector with said light source being fixed to said first tube so that a sealed connection is provided therebetween, a second tube with a second axis closing an angle between 100° and 20° with said first axis, said tubes having substantially equal and circular cross-sections and are attached to each other to form an integral housing, both of said tubes are cut with a plane extending normal to a plane determined by said first and second axes so that said plane cuts substantially the whole cross-sections of both tubes, said cutting plane closing substantially the same angle with said first and second axis, whereby an opening with an elliptical contour line is defined, a light diverting means closing said opening for diverting light arriving from said first tube to axial direction of said second tube, said means comprising a closing plate of a heat conducting material, a light transparent plate arranged in frontal section of said second tube to close inner space thereof, and heat dissipating means for providing operational temperature for said light source, said tubes forming parts of an integral housing made preferably of a plastic material, said housing comprises a round bar encircling the frontal and upper half of said second tube and extending downwardly substantially parallel to said first axis in the form of a pair of spaced legs.

PORTABLE LIGHT ASSEMBLY FOR AN AUTOMOBILE

Steven R. Hopper, 1596 "A" Coronado Ave., San Diego, Calif. 92154

Filed Jul. 12, 1989, Ser. No. 378,652
Int. Cl.[5] B60Q 1/00
U.S. Cl. 362—61 4 Claims

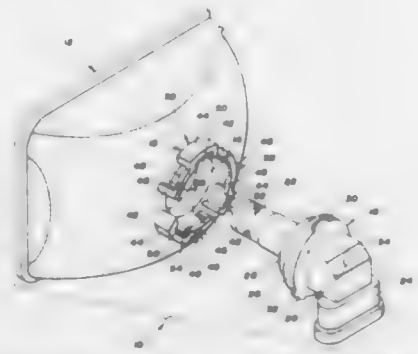
1. A portable flashlight assembly for an automobile comprising:

a flashlight having a rechargable battery base unit;

a signal lamp having a rechargable battery base unit;

a combination recharging and storage housing;

means for detachably securing said respective rechargable battery base units to said combination recharging and storage housing so that they may be recharged from the battery of an automobile; and

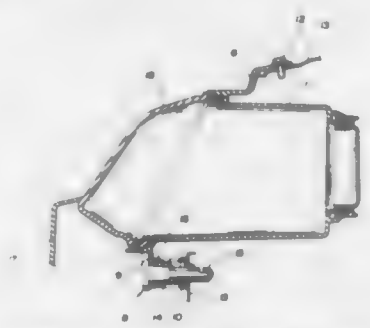


said flashlight comprising:

an inverted U-shaped handle having a pair of laterally spaced upright members each having a top end and a bottom end, said respective top ends being connected by a cross member, the bottom ends of said upright members being pivotally secured to the rechargable battery base unit of said flashlight;

a lamp housing having laterally spaced side walls and a front wall having a lens mounted therein, a high intensity bulb removably mounted in said lamp housing behind said lens; and

means for pivotally supporting said lamp housing about a horizontal axis between said spaced upright members at a height intermediate said top and bottom ends.



5,010,455
HEADLAMP ASSEMBLY
John M. Lealtin; William E. Nagengast, and Robert G. Roeske, all of Anderson, Ind., assignors to General Motors Corporation, Detroit, Mich.
Filed May 7, 1990, Ser. No. 520,314
Int. Cl.[5] B60Q *1/00*
U.S. Cl. 362—61 3 Claims

1. In combination, a vehicle headlamp assembly including a plastic reflector formed with a parabolic reflecting surface and a circular opening in said reflecting surface and adapted to receive the light bulb of a replaceable light bulb assembly from the rear of said reflector, said replaceable light bulb assembly having a collar and three circumferentially spaced ears projecting radially outwardly therefrom, a retainer integrally formed on the rear of said reflector during the molding of said reflector for receiving said ears and for maintaining said light bulb assembly in a predetermined position relative to said circular opening, said retainer comprising three separate and physically separated circumferentially retainer sections surrounding said circular opening of said reflector, the opposite ends of each of said retainer sections having an axially extending leg integrally formed with the rear of said reflector, a bridge member integrally formed with and interconnecting the legs of each of said retainer sections and having a ramp portion formed thereon, each of said retainer sections receiving one of said ears, a stop surface in at least one of said retainer sections, the arrangement being such that upon said retainer sections receiving said ears of said light bulb assembly the latter is thereafter rotated to cause each of said ears to move into initial contact with said ramp portion of each of said retainer sections so as to cause the bridge member to initially flex axially outwardly relative to said circular opening and upon continued rotation of said light bulb assembly one of said ears engages said stop surface after which said bridge member of each of said retainer sections serves to press said light bulb assembly inwardly towards said circular opening to orient said light bulb axially with respect to said reflecting surface.

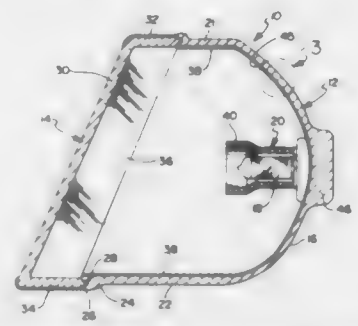
APPARATUS FOR ADJUSTING ATTITUDE OF OPTICAL AXES OF HEAD LAMPS ON VEHICLE
Yukio Ohmamyuda, Sagamihara; Toru Tanabe, Machida; Osamu Matsumoto, Fuchu; Hidenobu Suzuki, Kawasaki, and Masashi Jyouzuka, Yokohama, all of Japan, assignors to Stanley Electric Co., Ltd., Japan
Filed Jul. 31, 1990, Ser. No. 560,106
Claims priority, application Japan, Jul. 31, 1989, 1-89948[U], Jul. 31, 1989, 1-89949[U]
Int. Cl.[5] B60Q *1/06*
U.S. Cl. 362—66 8 Claims



1. In an apparatus for properly adjusting a head lamp on a vehicle wherein said apparatus comprises a motor driven actuator for adjusting an angle of elevation to be assumed by said head lamp and a controlling section for controlling actuation of said motor driven actuator by selectively changing a resistance value thereof, said motor driven actuator including a voltage comparing circuit, a motor circuit responsive to said comparing circuit and a potentiometer for generating a signal representative of the output position of the motor, said comparing circuit generating a signal responsive to the outputs of said potentiometer and said controlling section, said motor circuit comprising a driving circuit and a motor, and said controlling section including a switch and a plurality of resistors selectively connected to said switch via a plurality of contact positions to selectively come in contact with said switch depending on the present angle of a elevation, the improvement comprising:

a voltage dividing circuit arranged upstream of said voltage comparing circuit in the motor driven actutor, said voltage dividing circuit comprising two series connected resistors of which the common junction point between said two resistors is connected to one input terminal of said comparing circuit, one of said two resistors being connected to said switch in the controlling section; and

one of said contact positions being directly earthed, whereby said resistance value of the controlling section becomes zero ohms when the angle of elevation assumed by the head lamps is maximized in an upward tilted state being controlled by said voltage dividing circuit.

5,010,458
HEADLAMP ASSEMBLY
Robert L. Fraizer, Kokomo, Ind., assignor to General Motors Corporation, Detroit, Mich.
Filed Sep. 1, 1989, Ser. No. 401,891
Int. Cl.[5] F21M *3/02*
U.S. Cl. 362—80 9 Claims

1 A method of causing the clear lens of a vehicle headlamp to appear to an observer to be of a particular color when not lighted by the headlamp light source to provide a desired amount of light, said method comprising the steps of providing a rectangular headlamp housing having a cavity defined by a pair of planar and parallel upper and lower walls each having an inner surface and joined to a parabolic reflector portion having an inner surface, coating the inner surface of said parabolic reflector portion with a base coat having a desired color, and applying a semi-transparent metallic film over said basecoat so as to allow the color of said basecoat to be seen without preventing the desired amount of light emitted by said light source from being reflected by said parabolic reflector portion through said lens.

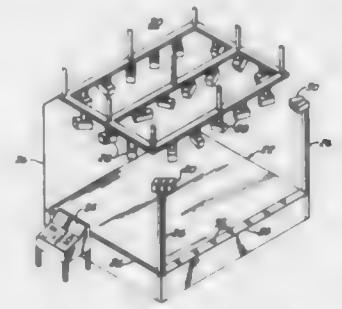
CONSOLE/LAMP UNIT COORDINATION AND COMMUNICATION IN LIGHTING SYSTEMS
Brooks W. Taylor, and Thomas E. Walsh, both of Dallas, Tex., assignors to Vari-Lite, Inc., Dallas, Tex.
Continuation of Ser. No. 249,225, Sep. 22, 1988, which is a continuation-in-part of Ser. No. 120,743, Nov. 12, 1987, abandoned, which is a continuation-in-part of Ser. No. 887,178, Jul. 17, 1986, abandoned. This application Jul. 18, 1990, Ser. No. 555,121
Int. Cl.[5] F21V *33/00*
U.S. Cl. 362—85 36 Claims



1. A lighting system having a plurality of multiple parameter lamp units each with respective control means for adjusting parameters of the associated lamp, a remote console control system for exercising control over said lamp units, a communication link between said console control system and said units, and a communication control system for coordinating the exchange of information between said console system and said lamps comprising:

(1) in said lamp units,

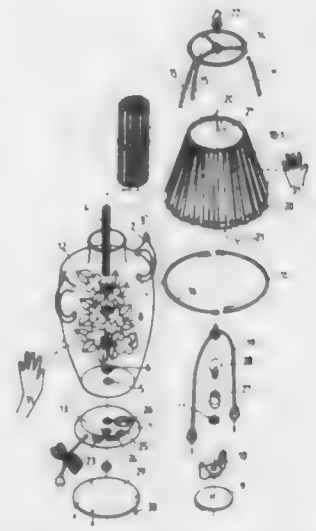
i. a processor including a communication controller coupled to said link for receiving signals from, and transmitting signals to said console control system;

ii. lamp identification means associated with the respective lamp processor for identifying each lamp to the console control system;

iii. said processor including means for recognizing calls

from said console control system which require a reply by the respective lamp unit;

iv. said processor also including means for generating said replies;



(2) in said console control system:

i. a processor including

(1) a communication controller coupled to said link for receiving signals from, and transmitting signals to said lamp units; and

(2) means for selectively and coordinately exercising communication control over said lamp units.

WATERSCAPE LAMP WITH SHADE OF PROXIMITY-CAPACITANCE-SENSING TYPE DEVICE
John Y. Lin, 1st Floor No. 12, Lane 179, Lee Shing Rd., Sec. 1, San Chung City, Taipei, Taiwan
Filed May 2, 1990, Ser. No. 517,811
Int. Cl.[5] F21V *23/04*
U.S. Cl. 362—101 3 Claims

1. A proximity-capacitance-sensing type lamp device with waterscape comprising:

a base block with a bottom plate underneath, having an IC mounted on the bottom side thereof, a center hole for mounting a metal pipe, a bulb socket to mount a small

bulb, a light aperture at one side thereof, and a pair of power wires mounted through one side thereof;

a lamp stand being fixedly mounted on said base block by means of said metal pipe, a metal pad, and a water-tight rubber nut;

a suitable volume of conductive water, being used as a conductor to transmit a signal for controlling the brightness of the lamp device, filled in said lamp stand which is substantially a transparent container;

a lamp shade being mounted on a metal supporting frame; and

a metal fixture being fixedly mounted to said metal pipe over said lamp stand.

MULTICOLOR PRESSURE-SENSITIVE ILLUMINATING DISPLAY PLATFORM

Kunio Saotome, 1-1-4 Nakamurakita, Nerima-ku, Tokyo, Japan

Filed Dec. 11, 1989, Ser. No. 448,724

Int. Cl.[5] F21V *33/00*

U.S. Cl. 362—101 12 Claims

1. A display platform for illuminating and supporting an object, comprised of:

(a) a housing having a light passing panel for supporting an object;

(b) illuminating means located in said housing beneath said light passing panel for illuminating an object supported by said light passing panel;

(c) an electrical power supply located in said housing;

(d) pressure sensitive switch means connected in circuit with said illuminating means and said electrical power supply for activating said illuminating means when an object of sufficient weight is placed on said light passing panel;

(e) filter assembly disposed between said illuminating means and said light passing panel, said filter assembly having a plurality of individual filters; and,

(f) means for manually moving the filter assembly, including when the object is disposed on the light passing panel, to selectively align the filters of the filter assembly with the illuminating means for filtering the light from the illuminating means to illuminate the object supported by the light passing panel.

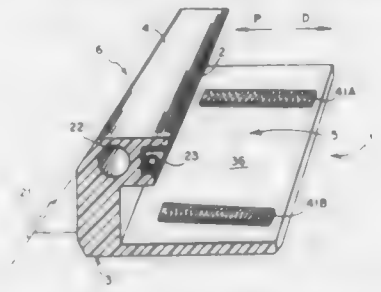
ILLUMINATION DEVICE FOR A HAND-HELD REMOTE CONTROL UNIT

Joseph H. Mintzer, Hartsdale, N.Y., assignor to M.C.R. Farmer, Inc., Hartsdale, N.Y.

Continuation-in-part of Ser. No. 179,744, Apr. 11, 1988, Pat. No. 4,893,222. This application Jan. 8, 1990, Ser. No. 462,064

The portion of the term of this patent subsequent to Jan. 9, 2007, has been disclaimed.

Int. Cl.[5] F21V *33/00*



U.S. Cl. 362—109 20 Claims

1. An illumination device for use with a hand-held remote control unit having a length, width and height and a back panel and a front control panel, said illumination device comprising:

a base and a projection extending from and projecting above said base and being exposed to a space formed above said base;

said projection containing illumination means capable of producing light rays directed toward said space; and

attachment means for releasably attaching at least a portion of the back panel of a hand-held remote control unit to at least

a portion of said base so that at least a portion of the length and width and the entire height of the hand-held remote control unit is maintained in a position within said space above said base so as to subject a selected surface of the front control panel to said illumination means for facilitating illumination of the selected surface by reflecting light rays therefrom, while permitting actuation and operation of the hand-held remote control unit.

U.S. Cl. 362—337 2 Claims

1. An optical lighting system for radiating light emitted from a light source to a surface, comprising:

an optical lens associated with a longitudinal optical axis for radiating the light from the light source, the optical lens having an incident light plane and an existing light plane;

the incident light plane and exiting light plane being oriented with respect to the longitudinal optical axis; the orientation of the incident light plane and exiting light plane being effective to produce irradiance on the surface at a point H defined by S(H), and being so that a light ray proceeding from the light source to the incident light plane makes an angle θ with the longitudinal optical axis such that the relationship between S(H) and θ is defined by:

$$\int S(H)HdH = \int J(\theta) \sin \theta d\theta$$

and an angle α_1 made by the incident light plane and the optical axis, is defined by:

$$\tan \alpha_1 = (-n \cos \theta_1 = \cos \theta)/(n \sin \theta_1 - \sin \theta)$$

and an angle α_2, which is the angle made by the exiting light plane and the longitudinal optical axis, is defined by

$$\tan \alpha_2 = (-n \cos \theta_1 + \cos \theta)/(n \sin \theta_1 \cdot - \sin \phi)$$

wherein, $J(\theta)$ is the radiant intensity of the light source, n is the refractive index of the optical lens system, θ_1 is an angle which a light ray proceeding through the optical lens makes with the longitudinal optical axis, and ϕ is an angle a ray proceeding from the exiting plane to the surface makes with the longitudinal optical axis.

1. A control apparatus of a DC power coupling system being formed of a plurality of power converters which are coupled together by a DC circuit, wherein:

one of said power converters comprises:

first power exchange means for exchanging electric power between a first AC power system and said DC circuit;

first power detecting means for detecting a first active power of the electric power exchanged between said first AC power system and said DC circuit;

first voltage detecting means for detecting a first DC voltage of said DC circuit;

first power exchange control means for controlling the power exchanging operation of said first power exchange means to be based on either one of said first active power and said first DC voltage; and

first determining means for determining which one of said first active power and said first DC voltage is to be used for the control performed by said first power exchange control means in accordance with a relative magnitude of said first DC voltage with respect to said first active power; and

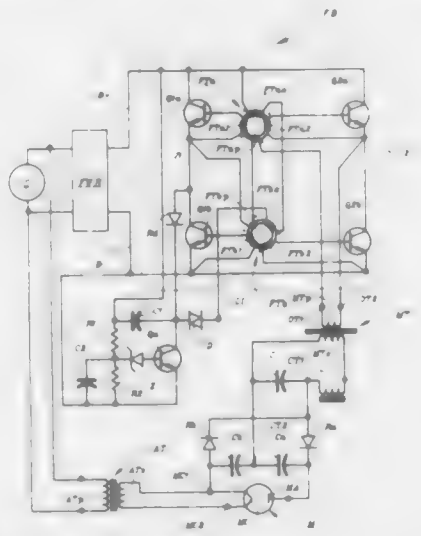
another of said power converters comprises:

second power exchange means for exchanging electric power between a second AC power system and said DC circuit;

second power detecting means for detecting a second active power of the electric power exchanged between said second AC power system and said DC circuit;

second voltage detecting means for detecting a second DC voltage of said DC circuit;

second power exchange control means for controlling the power exchanging operation of said second power exchange means to be based on either one of said second active power and said second DC voltage; and



second determining means for determining which one of said second active power and said second DC voltage is to be used for the control performed by said second power exchange control means in accordance with a relative magnitude of said second DC voltage with respect to said second active power.

CURRENT BALANCING STRUCTURE FOR SEMICONDUCTOR SWITCHING DEVICES

Kenneth Lipman, and Douglas G. Young, both of West Hartford, Conn., assignors to International Fuel Cells, Windsor, Conn.

Filed Mar. 20, 1990, Ser. No. 496,278
Int. Cl.[5] H02M *7/5387*
U.S. Cl. 363—132 7 Claims

1. An electrical current balancing structure comprising:

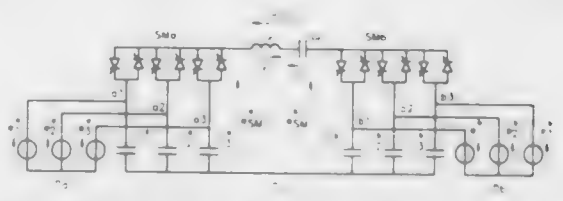
a first reference voltage bus for carrying a first voltage potential;

a second reference voltage bus for carrying a second voltage potential, one of said first and second reference voltage busses defining an output voltage bus, said second reference voltage bus carrying a voltage having a negative polarity relative to a voltage carried by said first reference voltage bus;

a plurality of semiconductor switching devices electrically connected in parallel to one another between said first and second reference voltage busses, each of said semiconductor switching devices having a conductive state and a non-conductive state wherein each of said individual semiconductor switching devices selectively conducts an electric current from said first reference voltage bus to said second reference voltage bus when said respective switching devices are in said conductive state;

magnetic current balancing means connected one-for-one in series between each of said individual semiconductor switching means and said one of said first and second reference voltage busses defining said output bus for causing equal current to flow through said respective individual semiconductor switching devices that are in said conductive state;

a third reference voltage bus for carrying a third voltage potential, and



a plurality of diode means for connecting said third reference voltage bus at a junction formed by the series connection between each of said semiconductor switching devices and said balancing means and in a polarity such that an electric current flows between said balancing means and said third reference voltage bus in response to one or more of said individual semiconductor switching devices being in said non-conductive state at substantially the same time that one or more of said individual semiconductor switching devices being in said conductive state, whereby the sum of currents flowing through all of said conductive semiconductor switching devices is less than the current flowing in said one of said first and second reference voltage busses defining said output voltage bus.

THREE-PHASE AC-TO-AC SERIES RESONANT POWER CONVERTER WITH RESTUSED NUMBER OF SWITCHES

J. Ben Klaassens, Delft, Netherlands; Hian K. Lauw, Corvallis, Oreg., and Freddy de Beer, Delft, Netherlands, assignors to Robert F. Frijouf, Tampa, Fla.

Filed Jan. 26, 1989, Ser. No. 371,712
Int. Cl.[5] H02M *5/27*
U.S. Cl. 363—160 7 Claims

1. An improved resonant converter for transferring electrical power between a first, second and third input and a first, second and third output, comprising:

a series resonant circuit including a capacitor and an inductor connected in series;

first, second and third bidirectional input switch means connecting the first, second and third inputs to said series resonant circuit, respectively;

first, second and third bidirectional output switch means connecting the first, second and third outputs to said series resonant circuit, respectively;

first, second and third input capacitor means connected to the first, second and third inputs, respectively;

first, second and third output capacitor means connected to the first, second and third outputs, respectively; and

means connecting said first, second and third input capacitor means to said first, second and third output capacitor means for enabling only six bidirectional switches to interconnect the first, second and third inputs to the first, second and third outputs.

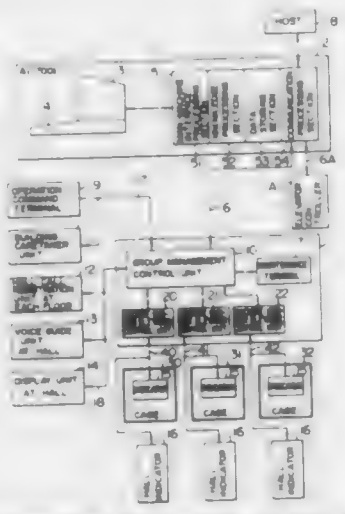
CUSTOMER PARTICIPATORY ELEVATOR CONTROL SYSTEM



Kenzi Yoneda; Takaaki Ueshima; Soshiro Kuzunuki, all of Katsuta; Yuzo Morita, Hitachi, and Toshimitsu Tobita, Katsuta, all of Japan, assignors to Hitachi, Ltd., Tokyo, Japan

Filed Feb. 17, 1989, Ser. No. 311,952
Claims priority, application Japan, Mar. 4, 1988, 63-49536
Int. Cl.[5] G05B *13/02, 17/42*; G09C *15/00*; B66B *3/00*
U.S. Cl. 364—148 7 Claims

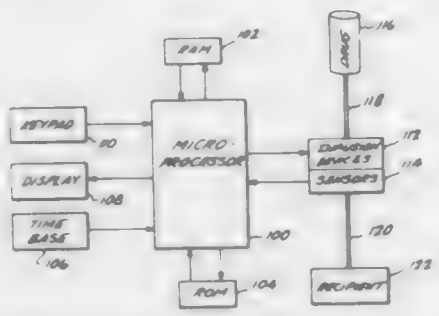
1. A customer participatory elevator control system for use in an elevator system having a plurality of elevators serving a

plurality of floors, means for storing predetermined specification information necessary to operate said elevators, and means for controlling the operation of said elevators on the basis of said predetermined specification information, said control system comprising:

means for setting and storing information necessary to operate said elevators on a trial basis;

means for rewriting the contents of said predetermined specification information storing means into trial operation information;

means for controlling a trial operation of said elevators on the basis of the trial operation information; and



means for analyzing results of the trial operation and restoring the original contents of said predetermined specification information storing means in response to said analyzed results.

METHOD AND APPARATUS FOR MODEL-BASED CONTROL OF AN OPEN-LOOP PROCESS

James R. Jacobs, Durham, N.C., assignor to Duke University, Durham, N.C.

Filed Aug. 31, 1989, Ser. No. 401,996
Int. Cl.[5] G05B *13/04*; A61M *5/172*
U.S. Cl. 364—150 22 Claims

1. A method for controlling a process to obtain a specified output, O_s, where the process is described by a linear model that defines an output of the process as a function of a specified control signal, wherein the control signal controls an actuator that affects the process, said method comprising the steps of:

(a) arbitrarily selecting a first value, X_1, and a second value, X_2, for the control signal, and initializing a plurality of state variables in the model;

(b) as a function of the first and second values of the control signal, which are respectively input to the model, determining corresponding first and second output values, O_1 and O_2, that would be obtained at the end of an interval of time, Δt, were the control signal to be applied for this interval;

(c) interpolating with respect to the first and second values of the control signal and corresponding first and second output values to determine a desired value, X_d, for the control signal that should produce the specified output, O_s, at the end of the time interval, Δt;

(d) for the time interval, Δt, operating the process using the desired value, X_d, determined in step (c) for the control signal;

(e) determining a value, X_a, of the control signal actually used by the actuator during the time interval, Δt;

(f) using the model, determining a computed value for the output, O_c, as a function of the value of the control signal determined in step (e); and

(g) reiteratively repeating steps (b) through (f), each successive iteration using values for the state variables in the model that depend on the computed value of the output determined in step (f) of the previous iteration, so that control of the process tracks changes in the specified output and the process quickly converges on the specified output

ELECTRONIC PARTS POSITIONING APPARATUS

Shigeru Tsuruta, Ohizumimachi, and Sadao Masuda, Menumamachi, both of Japan, assignors to Sanyo Electric Co., Ltd., Morigushu, Japan

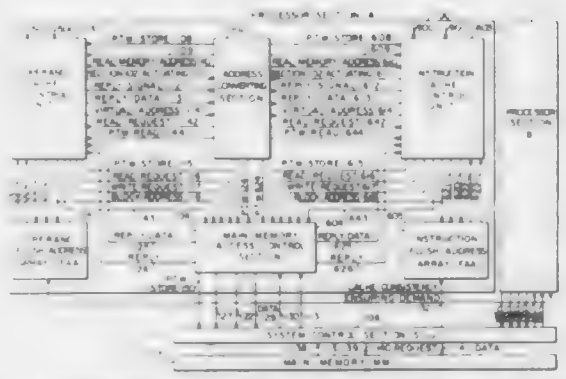
Filed Jan. 17, 1989, Ser. No. 298,178
Claims priority, application Japan, Jan. 19, 1988, 63-8869
Int. Cl.[5] G05B *19/18*
U.S. Cl. 364—167.01 21 Claims

1. An electronic parts positioning apparatus for horizontally positioning a chip part held by holding means after a closing operation is effected by relative movement of at least two pairs of opposing positioning pawls, comprising:

setting means for setting information concerning an interval between opposing positioning pawls of each of said two pairs and information concerning a size of said chip part;

memory means for storing the information set by said setting means;

calculating means for calculating a distance for moving relatively said positioning pawls at a high speed and a distance for moving relatively said positioning pawls at a low speed thereafter and for positioning on the basis of the information stored in said memory means; and



control means for controlling a driving source for driving said positioning pawls toward each other so that said positioning pawls may at first move at the high speed and thereafter move at the low speed, in correspondence with each said distance calculated by said calculating means.

5,010,475

CONSISTENCY ENSURING SYSTEM FOR THE CONTENTS OF A CACHE MEMORY

Osamu Hazawa, Tokyo, Japan, assignor to NEC Corporation, Tokyo, Japan

Continuation-in-part of Ser. No. 934,092, Nov. 24, 1986, abandoned. This application Oct. 28, 1988, Ser. No. 264,067
Claims priority, application Japan, Nov. 25, 1985, 60-265781
Int. Cl.[5] G06F *15/16*
U.S. Cl. 364—200 4 Claims

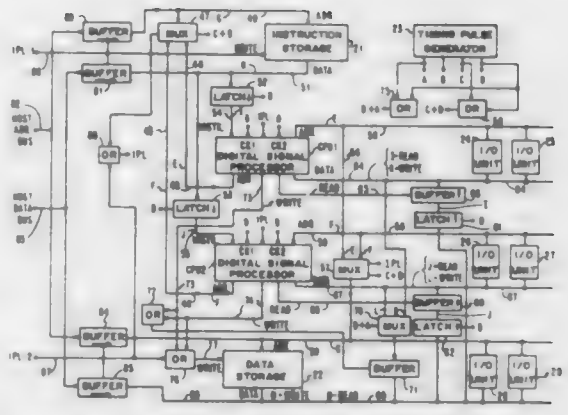
1 A consistency ensuring system having at least one main memory and a plurality of processors, each of said plurality of processors having a corresponding instruction cache memory and a corresponding operand cache memory wherein each of said plural processors comprises:

flush address array means for keeping a copy of an address array to be looked up and for invalidating a block of data in the corresponding instruction cache memory or the corresponding operand cache memory in response to storing a corresponding block of data into said main memory from a non-corresponding processor;

address converting means for converting a virtual address to a real address and for updating a page table word after address conversion resulting in an updated page table word and storing the updated page table word in said main memory and not in said corresponding instruction cache memory and said corresponding operand cache memory;

signal generating means for generating a page table word store notice signal when said address converting means stores said updated page table word into said main memory; and

flush address array invalidating means for looking up and invalidating, in response to said page table word store notice signal and a real memory address of said page table word from said corresponding processor, the corresponding block of data in the corresponding instruction cache memory and the corresponding operand cache memory of said corresponding processor,



wherein whenever an instruction is stored in the corresponding instruction cache memory and the main memory, said instruction cannot be stored in the corresponding operand cache memory and, whenever an operand is stored in the corresponding operand cache memory and the main memory, said operand cannot be stored in the corresponding instruction cache memory.

TIME MULTIPLEXED SYSTEM FOR TIGHTLY COUPLING PIPELINED PROCESSORS TO SEPARATE SHARED INSTRUCTION AND DATA STORAGE UNITS

Gordon T. Davis, Boca Raton, Fla., assignor to International Business Machines Corporation, Armonk, N.Y.

Filed Jun. 20, 1986, Ser. No. 876,625
Int. Cl.[5] G06F *13/14, 13/40, 9/38*
U.S. Cl. 364—200 5 Claims

1. A digital information processing system comprising:

at least two digital processors;

an instruction storage mechanism for storing processor operating instructions;

a first multiplexing mechanism for coupling the processors to the instruction storage mechanism in a time multiplexed manner for enabling each processor to have a periodic regularly occurring turn at accessing the instruction storage mechanism;

a separate data storage mechanism for storing data separate from said mechanism for storing processor operating instructions;

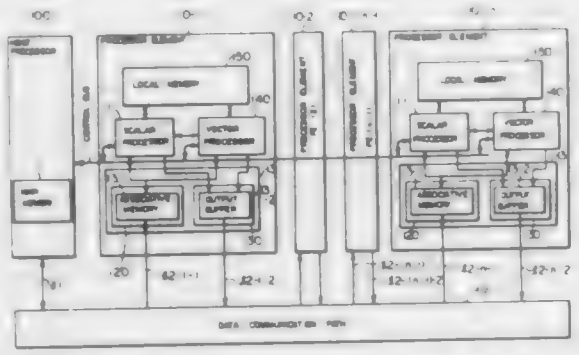
and a second multiplexing mechanism for coupling the processors to the data storage mechanism in a time multiplexed manner for enabling each processor to have a periodic regularly occurring turn at accessing the data storage mechanism;

each digital processor being a pipelined processor having an instruction fetching mechanism, an instruction decode mechanism and an execution mechanism;

each digital processor having an address bus port and a data bus port for the instruction fetching mechanism;

each digital processor having an address bus port and a data bus port for the execution mechanism;

the first multiplexing mechanism including means for coupling the address bus ports and the data bus ports for the instruction fetching mechanisms to the instruction storage mechanism so that each instruction fetching mechanism is given a periodic regularly occurring turn for purposes of accessing the instruction storage mechanism;



and the second multiplexing mechanism includes means for coupling the address bus ports and the data bus ports for the execution mechanisms to the data storage mechanism so that each execution mechanism is given a periodic regularly occurring turn for purposes of accessing the data storage mechanism.

5,010,477

METHOD AND APPARATUS FOR TRANSFERRING VECTOR DATA BETWEEN PARALLEL PROCESSING SYSTEM WITH REGISTERS & LOGIC FOR INTER-PROCESSOR DATA COMMUNICATION INDEPENDENTS OF PROCESSING OPERATIONS

Koichiro Omoda, Sagamihara; Teruo Tanaka, Hachioji; Junji Nakagoshi; Naoki Hamanaka, both of Tokyo, and Shigeo Nagashima, Hachioji, all of Japan, assignors to Hitachi, Ltd., Tokyo, Japan

Filed Oct. 15, 1987, Ser. No. 109,293
Claims priority, application Japan, Oct. 17, 1986, 61-245241; Oct. 29, 1986, 61-255663
Int. Cl.[5] G06F *7/02, 15/347, 15/16, 9/38*
U.S. Cl. 364—200 12 Claims

1. A parallel processor system having a plurality of processors and a data communication path connected to said processors for transmitting data between said processors, each of said processors comprising:

(a) a memory for storing data and for storing instructions, the data including a plurality of vector data each comprising a set of vector elements, and the instructions comprising vector instructions;

(b) a plurality of vector registers connected to said memory, each vector register storing vector data, receiving vector data from said memory and providing vector data to said memory;

(c) operation means, connected to said vector registers, for performing an operation on vector data read from one of the vector registers, and for providing vector data obtained as a result of the operation to one of the vector registers;

(d) a data receiver connected to said data communication path for receiving vector data from said data communication path, the vector data being transmitted by another processor;

(e) a data transmitter connected to said data communication path for transmitting vector data to be processed by another processor to said data communications path; and,

(f) control means, connected to said memory, said vector registers, said data transmitter, and said data receiver, for controlling vector data reading from and vector data writing into said vector registers, said control means including execution means, responsive to a vector instruction of a first kind, fetched from said memory for reading first vector data from a first register of said vector registers designated by the vector instruction and for providing the first vector data to said data transmitter to be transmitted thereby, and the execution means further being responsive to a vector instruction of a second kind, fetched from said memory for writing into a second register of said vector registers designated by the vector instruction, second vector data received by said data receiver.

ENTITY-ATTRIBUTE VALUE DATABASE SYSTEM WITH INVERSE ATTRIBUTE FOR SELECTIVELY RELATING TWO DIFFERENT ENTITIES

Roger L. Deran, 1958 Menalto Ave., Menlo Park, Calif. 94025

Continuation of Ser. No. 850,961, Apr. 11, 1986, abandoned.
This application Aug. 2, 1989, Ser. No. 393,093
Int. Cl.[5] G06F *15/417*
U.S. Cl. 364—200 7 Claims

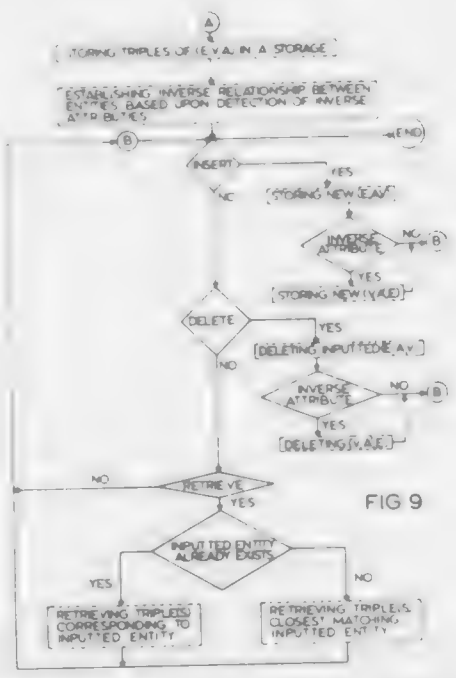

FIG 9

1. In a database management system having storage means, editor means, input means, and display means, a machine-implementing method comprising the steps of:

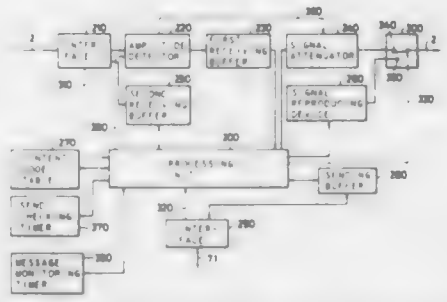
storing a plurality of triples in said storage means, each said triple includes an entity, an atribute of said entity, and a value of said attribute; each of said triples are arranged in a predetermined order according to relative significance of said entities, each of said triples having a common entity are arranged sequentially in said predetermined order according to relative significance of the corresponding attributes, each of said triples having the common entity and a common attribute are arranged sequentially in said predetermined order according to relative significance of the corresponding values;

selectively establishing an inverse relationship between one or more of said attributes and another one or more of said attributes in response to one of inputted information from the system and information inputting via the input means;

displaying a sequence of subset of said plurality of triples in said display means;

interactively inputting a new triple with an entity, an attribute, and a value via said input means wherein said attribute of said new triple is inputted explicitly or implicitly;

inserting said new triple into a specified location of said plurality of arranged triples according to eh significance of said entity, said atribute, and said value of said new triple;



determining by said editor means whether said atribute of said inputted triple has an inverse attribute, and, if so, storing an inverted triple having said value, said inverse attribute, and said entity of said inputted triple into another specified location of said plurality of arranged triples according to the significance of said entity, said attribute, an said value of said inverted triple.

INFORMATION PROCESSING AND STORAGE SYSTEM WITH SIGNAL TRANSMISSION LOOP LINE

Kinji Mori; Yuko Kunai, both of Kawasaki; Masakazu Akiyama, Katsuta; Tadaaki Kadoya, Narashino; Katsumi Kawano, Nerima; Shoji Miyamoto; Makoto Nohmi, both of Kawasaki; Sadanori Shingai, Yokohama, and Hirokazu Ihara, Machida, all of Japan, assignors to Hitachi, Ltd., Tokyo, Japan

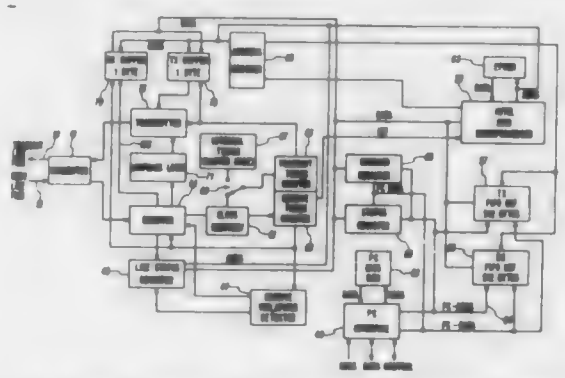
Continuation of Ser. No. 498,553, May 26, 1983, Pat. No. 4,763,254. This application Feb. 22, 1988, Ser. No. 158,698
The portion of the term of this patent subsequent to Aug. 9, 2005, has been disclaimed.
Int. Cl.[5] G06F *3/00, 3/04*
U.S. Cl. 364—200 17 Claims

1. An information processing and storage system comprising:

means in the form of a first signal transmission line for effecting transmission of data for purposes of storing that data;

first means connected to said first signal transmission line for inputting and outputting data to and from said first signal transmission line; and

second means connected to said first means for selectively fetching data from said first signal transmission line via said first means without eliminating the fetched data from said first signal transmission line;



said first means including third means for controlling the storage of data on said first signal transmission line by controlling the period of storage of data on said first signal transmission line in accordance with whether or not said data is fetched by said second means.

COMMUNICATION INTERFACE FOR INTERFACING A DATA BUS OF A COMPUTER TO A HIGH SPEED BIPOLAR COMMUNICATION SYSTEM

T. Raj Natarajan, Plano, Tex., assignor to DSP Technology, Carrollton, Tex.

Filed Jul. 21, 1987, Ser. No. 76,171
Int. Cl.[5] G06F *3/00*
U.S. Cl. 364—200 16 Claims

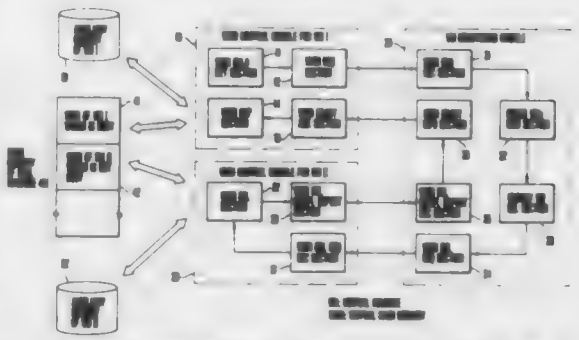
1. A digital interface for interfacing a Personal Computer data bus directly to a digital service used for transmitting and receiving digital data, the digital interface comprises:

a first digital format receiver interfacible to the digital service and includes a first digital format to a second digital format converter;

a first digital format transmitter interfacible to the digital service and includes a second digital format to a first digital format converter;

transmit buffer operatively connected between the Personal Computer data bus and the first digital format transmitter;

receiver buffer operatively connected between the Person Computer data bus and the first digital format receiver; and



a control system operatively connected to the first digital format receiver, first digital format transmitter, transmit buffer and receiver buffer and includes a clock recovery circuit operatively connected to the first digital format receiver for recovering a clock signal from the digital data having the first digital format.

MAIN MEMORY CONTROL SYSTEM FOR VIRTUAL MACHINE

Tomoyuki Ishida, Tokyo, Japan, assignor to NEC Corporation, Tokyo, Japan

Filed Oct. 7, 1988, Ser. No. 254,709
Claims priority, application Japan, Oct. 9, 1987, 62-255842
Int. Cl.[5] G06F *12/08*
U.S. Cl. 364—200 2 Claims

1. A virtual main memory control system coupled for use with a real data processing machine coupled to a real main memory, said real machine having a plurality of virtual data processing machines and said real main memory having a plurality of virtual main memories, each virtual main memory of said plurality of virtual main memories having a dedicated relationship with only one respective virtual machine of said plurality of virtual machines, having a given data storage capacity and providing a storage overload indication when storage requirements of a respective virtual machine are in excess of said given capacity, said virtual main memory control system comprising:

mean for detecting said storage overload indication for one virtual main memory of said plurality of virtual maim memories, having said dedicated relationship with a respective one virtual machine of said plurality of virtual machines having given storage requirements:

means for requesting access to another virtual main memory of said plurality of virtual main memories for said one virtual machine in response to said means for detecting;

means for monitoring said plurality of virtual main memories to locate at least one of said plurality of virtual main memories having an unused given storage capacity sufficient for said given storage requirements of said one virtual machine, in response to said means for requesting;

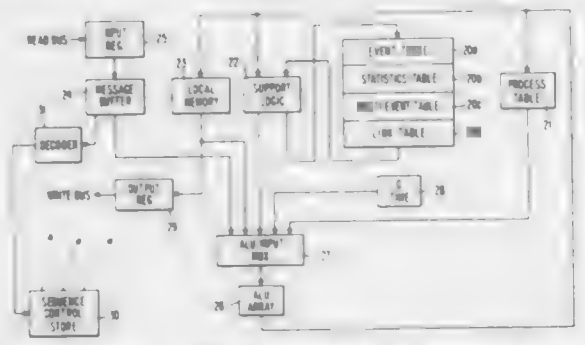
means for selecting one of said located virtual main memories in response to said means for monitoring, said selected virtual main memory having said dedicated relationship with another virtual machine;

means for releasing said selected virtual main memory from said dedicated relationship with said other virtual machine, in response to said means for selecting to provide availability of said selected virtual main memory,

means for informing said one virtual machine of said availability of said selected virtual main memory, in response to said means for releasing; and

means for supplying access to said selected virtual main memory for said one virtual machine, in response to said means for informing.

5,010,482



MULTI-EVENT MECHANISM FOR QUEUING HAPPENED EVENTS FOR A LARGE DATA PROCESSING SYSTEM

John A. Keller, Coatesville; Barry S. Traylor, Downingtown, and Robert H. Tickner, Paoli, all of Pa., assignors to Unisys Corp., Detroit, Mich.

Continuation of Ser. No. 68,860, Jul. 2, 1987, abandoned. This application Mar. 23, 1989, Ser. No. 328,812

Int. Cl.[5] G06F *9/46*

U.S. Cl. 364—200 **11 Claims**

1. In a processing system having at least one central processor and at least one memory module for storing a plurality of processes to be executed by said at least one processor, which processes require different events to occur before their execution can be completed, a multi-event queuing mechanism comprising:

input means coupled to said at least one central processor to receive a command to allocate one of an event token and a multi-event token to a process currently being executed;

event table means coupled to said input means to store status information about various events designated by allocated event tokens including whether that event token has been allocated and whether that event has occurred;

multi-event table means coupled to said input means and said event table means to store information about various events that have been grouped together designated by allocated multi-event tokens and to form a linked list of such events as each event occurs;

output means coupled to said event table means, said multi-event table means, and to said at least one central processor for transmission of a requested event token received from said event table means and a requested multi-event token received from said multi-event table means; and

control means coupled to said input means, output means, event table means, and multi-event table means to respond to said command and to maintain status of the various event tokens and multi-event tokens including whether they are available.

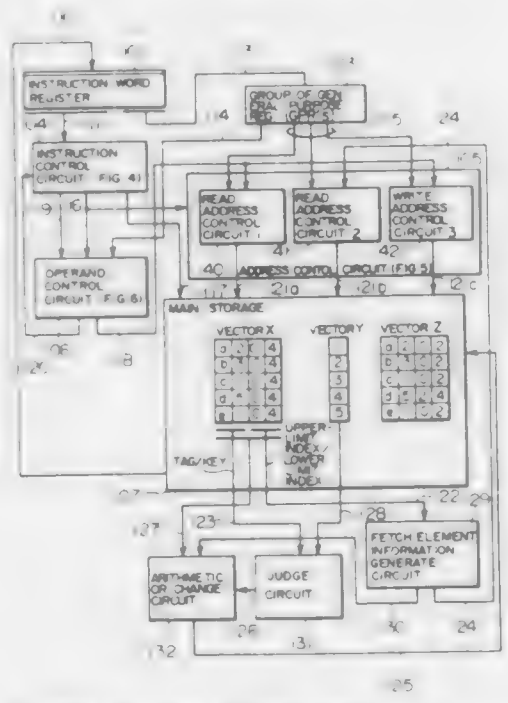
VECTOR PROCESSOR CAPABLE OF INDIRECT ADDRESSING



Yusuke Mishina, Kunitachi, and Keiji Kojima, Kodaira, both of Japan, assignors to Hitachi, Ltd., Tokyo, Japan

Filed Apr. 7, 1988, Ser. No. 178,913

Claims priority, application Japan, Apr. 8, 1987, 62-84735

Int. Cl.[5] G06F *15/347*

U.S. Cl. 364—200 **22 Claims**

1. A vector processing apparatus comprising:

means for holding a plurality of vectors each including a plurality of sequential elements;

first read means connected to said holding means for sequentially reading from said holding means a group of elements of a first vector in an order of the elements, each element of the first vector including first and second portions, the first portion having data to receive an arithmetic or logic operation, the second portion having an index related to a corresponding element of the second vector which should receive the arithmetic or logic operation together with the element of the first vector;

second read means connected to said holding means for sequentially reading from said holding means a group of elements of the second vector in parallel to reading of the group of elements of the first vector;

operation means connected to said first and second read means for effecting in a pipeline manner the arithmetic or logic operation on pairs of operands, one operand of each pair including a first portion of an element of the first vector, read out by said first read means and another operand of the pair including a corresponding element of the second vector, read out by said second read means;

said second read means including indirect read means for effecting a predetermined operation on respective second portions of respective elements of the first vector read out by said first read means, to generate addresses of corresponding elements of the second vector which are to be subjected to the arithmetic or logic operation together with the first portions of the respective elements of the first vector, and for sequentially reading from said holding means the corresponding elements of the second vector based on the generated addresses.

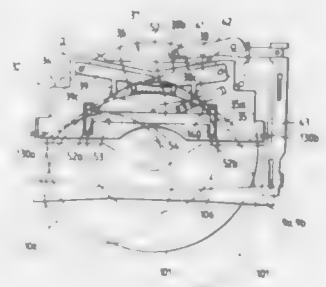
DISC GUIDE MECHANISM FOR AUTOMOTIVE DISC PLAYER



Kazuo Kobayashi; Kiyoshi Morikawa; Yoshinori Yamada; Masakazu Kurumada, and Masanori Sugihara, all of Saitama, Japan, assignors to Pioneer Electronic Corporation, Tokyo, Japan

Filed Mar. 30, 1990, Ser. No. 501,823

Claims priority, application Japan, Mar. 31, 1989, 1-83723

Int. Cl.[5] G11B *3/70, 5/84, 7/26*

U.S. Cl. 369—77.2 **1 Claim**

1. A disc reproducing apparatus in which a large- or small-diameter disc inserted through a disc inserting opening is transferred to a predetermined position within a player, a clamper arm extending over a turntable on which the disc is placed is operated to fix the disc onto the turntable, and information recorded in the disc is reproduced by rotating the turntable, wherein:

a disc guide plate for guiding the small-diameter disc to a clamp position is pivotally mounted to said clamper arm,

a disc guiding recess into which the small-diameter disc can slip and which has a sufficiently wide opening,

a restraining member for blocking the advancement of only the large diameter disc into the disc guiding recess;

when said small-diameter disc is inserted through the disc inserting opening, said small-diameter disc is advanced into the disc guiding recess to be positioned at the clamp position;

when the large-diameter disc is inserted through the disc inserting opening, the large-diameter disc is guided by said restraining member to the outside of said disc guiding recess such that the large-diameter disc pushes away the disc guide plate to be guided to the clamp position on said turntable.

APPARATUS, SYSTEM AND METHOD FOR CREATING CREDIT VOUCHERS USABLE AT POINT OF PURCHASE STATIONS

Steven T. Bigari, Colorado Springs, Colo., assignor to JBH Ventures, Manitou Springs, Colo.

Filed Jan. 31, 1989, Ser. No. 304,566

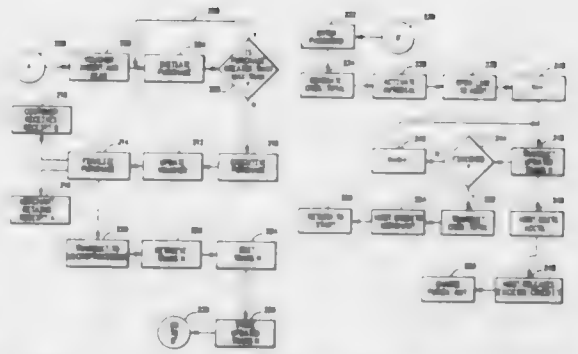
Int. Cl.[5] G06F *15/30*

U.S. Cl. 364—408 **39 Claims**

1. A payment voucher processing apparatus adapted to be used in conjunction with a family of charge cards wherein a customer who has a member charge card can execute a proposed transaction to obtain a guaranteed voucher for a selected maximum charge amount for purchase of goods or services from a merchant wherein a host institution administers customer accounts for the family of charge cards and has verification means for inquiring into the customer account to determine an availability of funds for a proposed charge and issues an approval status signal when funds are available and a disapproval status signal when funds are not available in the customer account, the payment voucher processing apparatus comprising:

a processing means for processing a proposed transaction;

a start means for producing a start signal to initiate a transaction event;



entry means for inputting into said processing means the proposed transaction including account identification data of a member charge card correlated to a customer account administered by the host institution and a maximum charge amount;

means for establishing communication with the host institution;

means for transmitting the identification data and the maximum charge amount to the host institution to interrogate the host institution regarding the availability of funds in customer account at least equal to the maximum charge amount;

receiving means for receiving approval and disapproval signals from the host institution;

said processing means including means responsive to an approval signal for producing a print signal,

voucher producing means responsive to the print signal to produce a voucher indexed with a maximum transaction charge equal to the maximum charge amount, and with the account identification data;

means for storing the account identification data and the maximum charge amount for each approved transaction;

means for retrieving each approved transaction; and

edit means for editing each approved transaction to charge the maximum charge amount to an actual purchase amount whereby the actual purchase amount and the account identification data may be communicated to the host institution by way of the transmitting means.

13. A payment voucher apparatus for use in conjunction with a family of charge cards wherein customers who have a respective member of said family of charge cards can each execute a transaction to obtain a guaranteed voucher for a selected maximum charge amount for use in purchasing goods or services from a merchant wherein a host institution adminis-

ters accounts for the family of charge cards and issues approval/disapproval status signals for a proposed charge and a guarantee of payment of the proposed charge along with approval identifier data when the merchant receives an approval thereof, the payment voucher apparatus comprising:

data transmitting and receiving means for transmitting and receiving data respectively to and from the host institution over a communication line established therebetween;

a microprocessor in communication with said data transmitting and receiving means;

manual entry means for inputting into said microprocessor transaction data corresponding to the proposed charge including the maximum charge amount, said manual entry means including a start key means for initiating the transactions;

an autodialer means responsive to activation of the start key means for automatically opening the communication line with the host institution;

a charge card reader operative to receive a customer's charge card and produce identification data corresponding to the charge card, said identification data transmitted to the host institution by said data transmitting and receiving means over the communication line opened by the autodialer means;

said microprocessor operative in response to input of transaction data from said manual entry means to interrogate the host institution by way of said data transmitting and receiving means in order to obtain the approval/disapproval status for the proposed charge, said microprocessor operative in response to an approval signal and approval identifier data to produce a print signal, said microprocessor including data storage means for storing the identification data and the transaction data for each approved transaction;

a printer operative in response to the print signal to produce a voucher being exchangeable for goods or services of the merchant; said voucher being for an approved charge corresponding to the maximum charge amount, said voucher indexed with transaction identification data, the maximum charge amount and the approval identifier data; and

said microprocessor operative in response to input of the actual purchase amount for the respective transaction by the manual entry means to retrieve the respective transaction data stored in said data storage means and edit the respective maximum charge amount to reflect the actual purchase amount for the respective transaction and store said actual purchase amount, whereby each voucher is corrected at a point of purchase to create an updated receipt reflecting an actual purchase amount.

36. A method for processing charge card transactions for a family of charge cards administered by a host institution wherein the host institution maintains a cardholder file of available credit limit for each member card account in the family of charge cards and wherein a merchant can obtain an approval for a proposed credit charge against a charge card of a customer which charge card is a member of the family of charge cards comprising the steps of:

providing at least one payment voucher producing apparatus at a first location at a facility of the merchant including a data processor with memory;

providing at least one point of purchase sales station at a second location at the facility of the merchant remote from said first location;

entering identification data into said payment voucher producing apparatus corresponding to a respective customer charge card;

entering a maximum charge amount into said payment voucher producing apparatus corresponding to a proposed charge transaction;

electronically transmitting to the host institution over a communication line the identification data and the maximum charge amount correlated thereto;

verifying at the host institution the available credit limit in the member card account corresponding to the respective customer charge card to determine if the credit limit of the member card account to be exceeded;

issuing one of an approval signal if the maximum charge amount does not cause the credit limit to be exceeded while reserving the maximum charge amount in the member card account concurrently with the issuance of the approval signal and a disapproval signal if the maximum charge amount will cause the credit limit of the member card account to be exceeded;

automatically producing a voucher at the payment voucher producing apparatus in response to receipt of an approval signal from the host institution, said voucher being automatically indexed with the identification data and maximum charge amount;

storing the proposed charge transaction in memory of the data processor;

completing a purchase transaction for selected goods or services at the point of purchase station for an actual purchase amount less than or equal to the maximum charge amount;

updating the voucher at the point of purchase station to reflect the actual purchase amount;

editing the proposed charge transaction utilizing the data processor at the payment voucher apparatus to edit the maximum charge amount to an updated charge amount equal the actual charge amount;

electronically transmitting the updated charge amount and the identification data of the respective customer charge card to the host institution; and

retrieving and updating the respective member card account at the host institution to edit the maximum charge amount to the updated charge amount and release the difference therebetween back into the member charge account so that it is again available in the credit limit of the member card account.

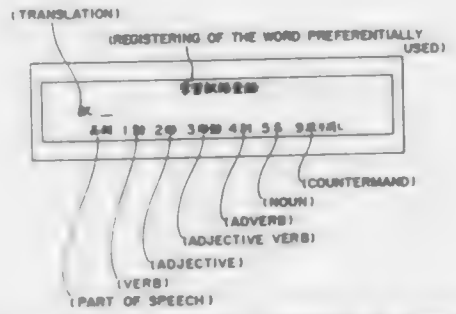
SYSTEM AND METHOD FOR LANGUAGE TRANSLATION INCLUDING REPLACEMENT OF A SELECTED WORD FOR FUTURE TRANSLATION



Hitoshi Suzuki; Shinobu Shiotani; Shinji Tokunaga, all of Nara; Tokuyuki Hirai, Yamatokoriyma; Yoji Fukumochi, Nara; Shuzo Kugimiya, Nara, and Ichiko Sata, Nara, all of Japan, assignors to Sharp Kabushiki Kaisha, Osaka, Japan

Continuation of Ser. No. 126,263, Nov. 27, 1987, abandoned. This application Feb. 5, 1990, Ser. No. 474,245

Claims priority, application Japan, Nov. 28, 1986, 61-284487; Nov. 28, 1986, 61-284488

Int. Cl.[5] G06F *15/38*

U.S. Cl. 364—419 **4 Claims**

1. A translation apparatus for translating an inputted sentence of an original language into a sentence of a target language and for outputting the translated sentence as an outputted sentence, comprising:

indicating means for indicating a selected word contained in the inputted sentence;

dictionary means for storing words corresponding to words of the original language and the targe language;

output means, operatively connected to said dictionary means and said indicating means, for outputting translated equivalent words of the target language from said dictionary means corresponding to said selected word;

input means, operatively connected to said output means, for inputting a desired translated equivalent word correspondign to said selected word, said desired translated equivalent word not being part of the output of said output means;

replacing means, operatively connected to said output means and said input means, for replacing the translated equivalent of said selected word contained in the translated sentence with a translated equivalent word selected from the outputted translated words of said dictionary means or with said new translated equivalent word inputted by said input means; and

means, operatively connected to said replacing means, for preferentially using said translated equivalent word used by said replacing means during future translation processes.

COMPUTER-BASED ENGINE DIAGNOSTIC METHOD

Van T. Stonehocker, Beloit, Wis., assignor to Coltec Industries Inc., New York, N.Y.

Filed Mar. 2, 1989, Ser. No. 317,893

Int. Cl.[5] G01M *15/00*; G06F *15/40*

U.S. Cl. 364—424.03 **4 Claims**

1. A system including a computer and a software program for providing product diagnostic information to a user, said system performing the method comprising the steps of:

storing a list of observable product faults;

storing a list of causes for each observable product fault;

displaying from said list of stored faults a group of two or more observable product faults;

and

in response to a user indication of at least two said observable product faults, displaying in decreasing order by number of occurrences, causes which are common to said user-indication of observed product faults, whereby the most probable cause for said observed product faults occurs at the head of said displayed group of product faults.

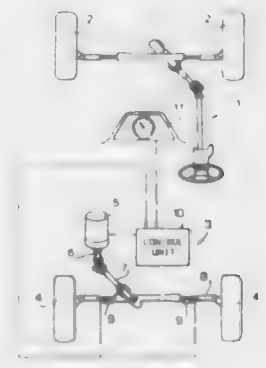
BEAR-WHEEL CONTROL METHOD FOR A MOTOR VEHICLE WITH A FOUR-WHEEL STEERING SYSTEM

Saiichiro Ohshita, and Kazuhiro Fukamachi, both of Oota, Japan, assignors to Fuji Jukogyo Kabushiki Kaisha, Tokyo, Japan

Filed May 15, 1989, Ser. No. 352,839

Claims priority, application Japan, May 16, 1988, 63-118579; Jul. 28, 1988, 63-189084

Int. Cl.[5] B62D *6/00*



U.S. Cl. 364—424.05 **4 Claims**

1. A method for controlling rear wheels of a four-wheel steering vehicle having a rear-wheel steering control system, comprising the steps of;

detecting rear-wheel slip angle (βr);

providing a transfer function (G(s)) including at least a derivative element;

calculating a desired rear-wheel steering angle (δr) upon an equation based on said rear-wheel slip angle and said transfer function expressed as

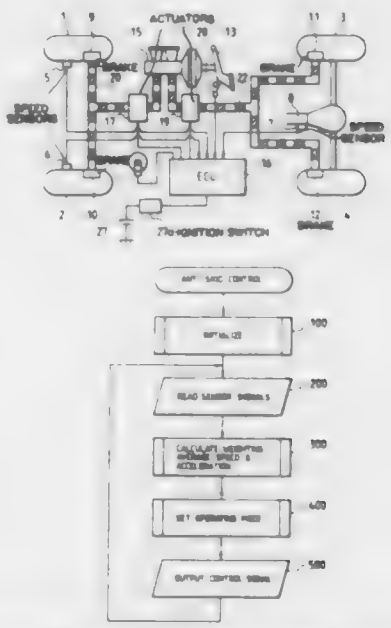
$$\delta r = -G(S)\, kr\, \beta r$$

where kr is a steering coefficient; and

applying the desired rear-wheel steering angle to the rear-wheel steering control system for controlling the rear wheels to the desired rear-wheel steering angle.

5,010,489

ANTI-SKID CONTROL SYSTEM WITH A COMMON BRAKING PRESSURE CONTROL DEVICE FOR DIFFERENT WHEELS



Shouichi Masaki, Chiryu; Akira Fukushima, Kariya; Shusaku Fujimoto, Kariya, and Makoto Nakano, Kariya, all of Japan, assignors to Nippondenso Co., Ltd., Kariya, Japan

Filed Apr. 3, 1989, Ser. No. 332,799

Claims priority, application Japan, Apr. 5, 1988, 63-83370

Int. Cl.[5] B60T *8/82*

U.S. Cl. 364—426.02 **12 Claims**

1. An anti-skid control system for use in a motor vehicle having at least first and second wheels and first and second

wheel-braking cylinders, braking pressures applied to said first and second wheel-braking cylinders being adjusted by a single braking pressure adjusting device to become equal to each other, said control system comprising:

first and second wheel speed sensors for respectively detecting rotational speeds of said first and second wheels to output first and second signals indicative of the detected rotational speeds thereof;

running state detecting means for detecting a running state of said motor vehicle to output a signal indicative of the detected running state thereof;

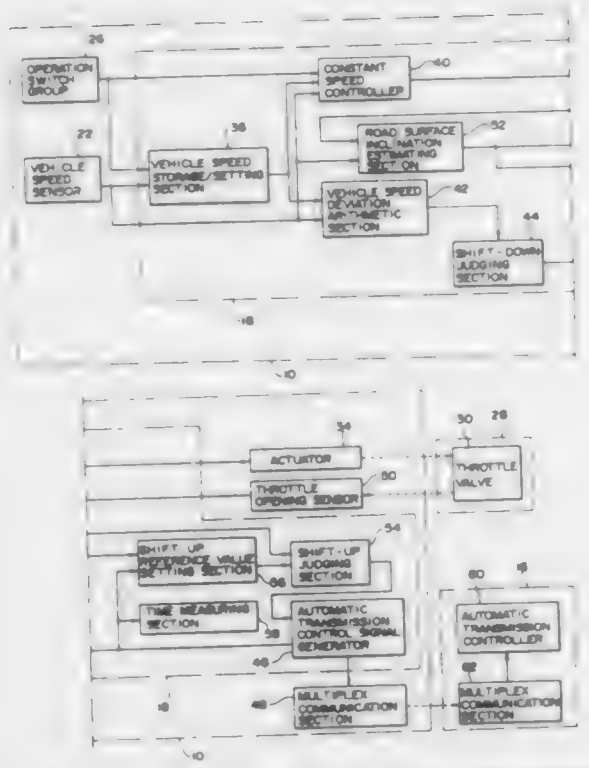
weighting coefficient determining means for determining, on the basis of the running state detected by said running state detecting means, weighting coefficients for the speeds detected by said wheel speed detecting sensors and gradually changing the weighting coefficients thereof in accordance with variations of the running state thereof;

calculation means for calculating a weighted average wheel speed on the basis of the wheel speeds of said first and second wheels and the weighting coefficients determined by said weighting coefficient determining means; and

control means for outputting a control signal to said barking pressure adjusting device in accordance with the calculated weighted average wheel speed so as to control the braking pressure to be applied to said first and second wheel-braking cylinders.

5,010,490

CONSTANT SPEED CONTROL APPARATUS FOR MOTOR VEHICLE



Yasuo Naito; Hiroyuki Kouzaki, both of Himeji, and Takeshi Murai, Hiroshima, all of Japan, assignors to Mitsubishi Electric Corporation, Tokyo and Mazda Motor Corporation, Hiroshima, both of, Japan

Filed Apr. 26, 1989, Ser. No. 343,380

Claims priority, application Japan, Apr. 28, 1988, 63-106142

Int. Cl.[5] B60K *31/00, 41/18*

U.S. Cl. 364—426.04 **15 Claims**

1. A constant speed control apparatus for a motor vehicle, comprising:

setting means for setting a target vehicle speed;

first detection means for detecting a vehicle speed of a traveling vehicle;

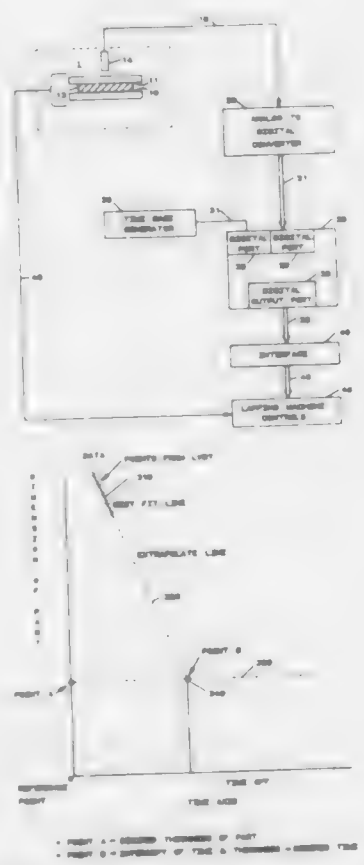
shift-down signal output means for, when the detected vehicle speed is decreased from the target vehicle speed to fall outside a predetermined range in a constant speed travel state, outputting a signal to cause an automatic transmission to perform a shift-down operation;

second detection means for detecting that the detected vehicle speed is substantially recovered to the target vehicle speed after the shift-down signal is output;

estimation means for estimating a road surface inclination on a basis of an engine load and the detected vehicle speed; and

shift-up signal output means for, when the detection result by said second detection means and an estimation result of substantially not an uphill by said estimation means are established, outputting a shift-up signal to said automatic transmission.

5,010,491



AUTOMATED SYSTEM FOR MACHINING PARTS TO CLOSE TOLERANCES

Alberto Biasillo, Maine, N.Y., and Richard C. Taylor, Warren Center, Pa., assignors to International Business Machines Corp., Armonk, N.Y.

Filed Dec. 27, 1988, Ser. No. 290,588

Int. Cl.[5] G06F *15/46;* **G05B** *19/18*

U.S. Cl. 364—474.28 **15 Claims**

1. A lapping machine control system comprising:

a. means for measuring the relative positions of first and second laps to develop analog signals representing the instantaneous distance between said laps;

b. analog to digital converter means for converting said analog signals to digital form;

c. control computer means for reading said digital signals as periodic intervals;

d. curve fitting means in said computer means for developing a curve representing the separation of said laps as a function of time;

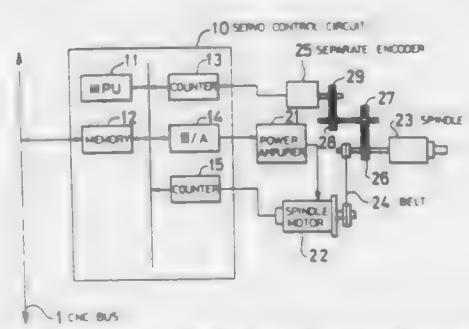
e. extrapolation mans in said computer means for predicting the point in time when the separation of said laps will reach a desired value; and,

f. means coupled to said extrapolation means for changing mode of said lapping machine when said point in time is reached.

5,010,492

SPINDLE CONTROL SYSTEM AND NUMERICAL CONTROL APPARATUS

Mitsuo Kurakake, Hino, and Jiro Kinoshita, Minamitsuru, both of Japan, assignors to Fanuc Ltd, Minamitsuru, Japan



PCT No. PCT/JP88/00875, § 371 Date Apr. 17, 1989, § 102(e) Date Apr. 17, 1989, PCT Pub. No. WO89/02104, PCT Pub. Date Mar. 9, 1989

PCT Filed Aug. 31, 1988, Ser. No. 343,150

Claims priority, application Japan, Sep. 2, 1987, 62-220013

Int. Cl.[5] G05B *19/407*

U.S. Cl. 364—474.29 **2 Claims**

1. A spindle control system for a numerical control apparatus (CNC) including a CNC bus, a spindle, and a spindle motor which produces pulses, comprising:

a servo control circuit, coupled to the CNC bus, for providing a command, said servo control circuit including:

a microprocessor;

a memory coupled to said microprocessor; and

first and second counters for counting pulses, said second counter coupled to the spindle motor to count the pulses produced by the spindle motor;

a power amplifier, a coupled to said servo control circuit and the spindle motor, for receiving the command from said servo control circuit and for controlling the rotation of the spindle motor; and

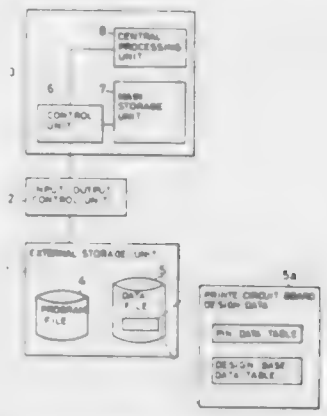
a separate encoder, coupled to said first counter and the spindle, for feeding back pulses to said first counter for contour control.

5,010,493

LOAD DISTRIBUTION METHOD

Kenji Matsumoto, Aiko; Tomoatsu Yanagita, Ebina; Yoshinori Nishiyama, Odawara; Masahiko Nagai, Naka, and Mitsuru Morikuni, Ebina, all of Japan, assignors to Hitachi, Ltd., Tokyo and Hitachi Computer Engineering Co., Ltd., Kanagawa, both of, Japan

Filed Apr. 26, 1989, Ser. No. 343,362



Claims priority, application Japan, Apr. 26, 1988, 63-103553

Int. Cl.[5] G06F *15/60*

U.S. Cl. 364—490 **10 Claims**

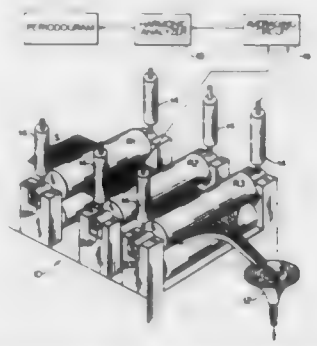
1. A load distribution method in which loads are divided into groups and each of plural input pins of integrated circuits of a load is wired continuously with one stroke of a signal transmission line in an order from a driving output pin in each group when wiring for distributing a drive signal from a driving output pin of an integrated circuit to plural input pins of integrated circuits, functioning as loads, which are mounted at given positions on a printed circuit board, the load distribution method comprising:

dividing the loads into groups by equally distributing a number of the loads so as to allow a load capacity to be equal on each of plural signal transmission lines;

computing a signal propagation delay time of a signal transmission line wired in an equal distance to a load which is equal in a wiring order from the driving output pin in each group; and

grouping the loads by determining a combination of loads in which the signal propagation delay time of the signal transmission line becomes the shortest.

5,010,494



METHOD AND APPARATUS FOR DETECTING MECHANICAL ROLL IMPERFECTIONS IN A ROLLER DRAFTING SYSTEM

Peter R. Lord, Raleigh, N.C., assignor to North Carolina State University, Raleigh, N.C.

Filed Sep. 9, 1988, Ser. No. 242,752

Int. Cl.[5] G01N *27/82;* **B21B** *37/00*

U.S. Cl. 364—507 **21 Claims**

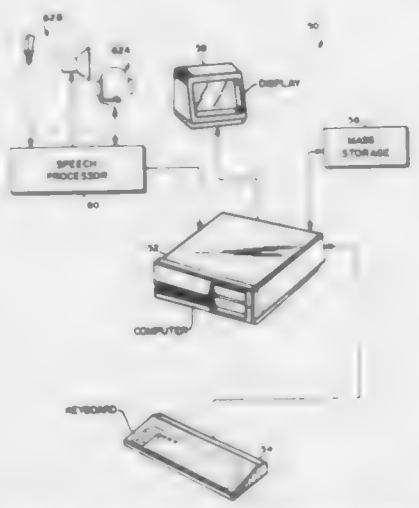
13. An apparatus for drafting an advancing strand of material, comprising:

a plurality of rotating mechanical components including at least two sets of cooperating drafting rolls,

means for guiding an advancing strand of material serially through the sets of rolls,

means mounting at least one pair of cooperating rolls of at least one of said sets so as to permit the separation between said one pair of rolls to vary, and including means for biasing said one pair of rolls toward each other to grip the advancing strand of material, and such that the thickness of the advancing strand of material causes said one pair of rolls to separate,

means for rotating the rolls within at least one of said sets at



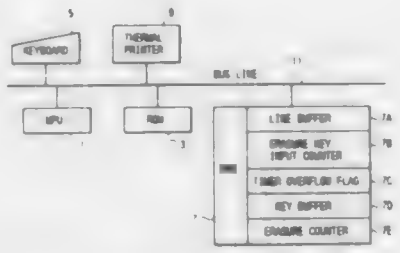
a different surface velocity from that of other sets so as to draft the material passing therethrough,
means for monitoring the separation between said one pair of cooperating rolls,
means for generating a signal representative of the separation between said one pair of cooperating rolls,
means for processing the generated signal so as to identify harmonic components thereof, and
means for correlating the processed signal with rotational frequencies of selected ones of the rotating mechanical components, and whereby synchronism between harmonic components of the processed signal and a rotational frequency is indicative of a mechanical imperfection in the associated mechanical component.

5,010,495

INTERACTIVE LANGUAGE LEARNING SYSTEM

John A. Willetts, Kensington, Md., assignor to American Language Academy, Rockville, Md.

Filed Feb. 2, 1989, Ser. No. 305,223
Int. Cl.[5] G10L *5/00*
U.S. Cl. 364—513.5 **25 Claims**



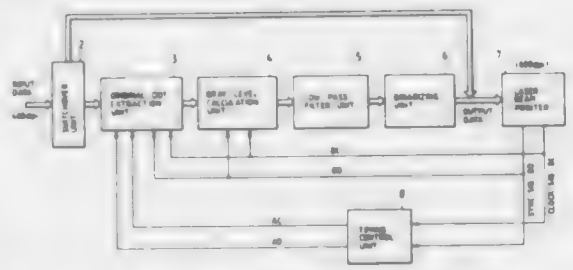
1. An interactive language learning system comprising:
storing means for storing a digitized speech version of a passage of language and for also storing a digital data textual version of said same passage;
a display for displaying text corresponding to said passage;
selecting means operatively connected to said display and to said storing means and operable by a user for selecting a portion of said passage, and for causing the portion of said stored digital data textual version corresponding to said selected passage portion to be displayed as text on said display; and
speech processing means for:
selecting the portion of said stored digitized speech version corresponding to said selected portion of said passage,
converting said selected digitized speech version portion to audio signals for use in generating speech sounds,
converting audio signals representing user speech into digitized speech signals representing said user speech, and
subsequently reconverting said digitized speech signals representing said user speech to audio signals for use in generating further speech sounds so as to permit said user to listen to and compare his own speech with a spoken version of said passage corresponding to said stored digitized speech version.

5,010,496

DOCUMENT PROCESSING SYSTEM

Nobuo Shibazaki, Yokohama, Japan, assignor to Canon Kabushiki Kaisha, Tokyo, Japan

Filed Jun. 14, 1989, Ser. No. 365,719
Claims priority, application Japan, Jun. 17, 1988, 63-148222
Int. Cl.[5] G06K *15/00*
U.S. Cl. 364—519 **8 Claims**



1. A document processing system comprising:
instruction means for instructing, by entry,
erasing means for erasing a printed character;
counter means for counting a first number of entries of said instruction means; and
control means for controlling said erasing means to erase a second number of printed characters, said second number being equal to said first number of entries counted by said counter means.

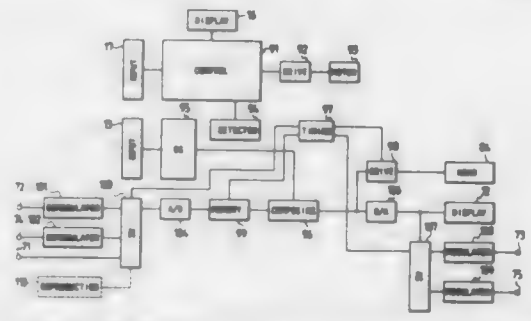
5,010,497

IMAGE INFORMATION RECORDER HAVING A RESOLUTION DENSITY TRANSFORMATION DEVICE

Akira Shimada, Hitachi, Japan, assignor to Hitachi, Ltd., Tokyo, Japan

Filed Jan. 9, 1989, Ser. No. 294,677
Claims priority, application Japan, Jan. 19, 1988, 63-7630
Int. Cl.[5] G06F *15/66*
U.S. Cl. 364—519 **6 Claims**

1. An image information recorder comprising:
printer means, capable of substantially continuous printing in a scanning line direction, for reproducing binary input data of an image having a first resolution density supplied to said printer means as a visual image having a second resolution density in accordance with the binary input data;
original dot extraction means for receiving therein the binary input data in response to a predetermined timing control signal generated on the basis of a synchronizing signal used for scanning and a clock signal from said printer means and for selecting dots from the binary input which contribute to a gray level calculation of a dot in the image to be reproduced in response to the synchronizing signal used for scanning and the clock signal;
gray level calculation means, responsive to the synchronizing signal and the clock signal, for carrying out the gray level calculation in accordance with a predetermined algorithm based on gray levels of the dots selected by said original dot extraction means for converting a result of the gray level calculation into analog form to produce an analog image signal;



low pass filter means for smoothing the analog image signal produced by said gray level calculation means; and
binarizing means for comparing the analog image signal smoothed by said low pass filter means with a threshold signal of a predetermined constant value to produce the binary input data supplied to said printer means.

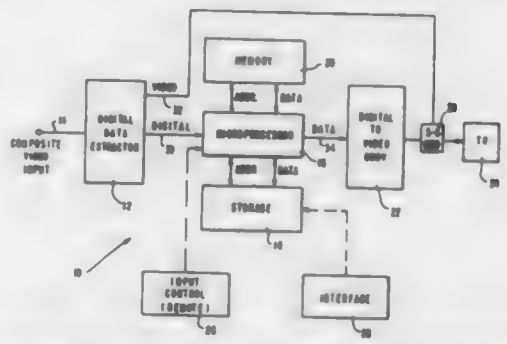
5,010,498

VIDEO PRINTER

Hidenobu Miyata, Tokyo, Japan, assignor to GFK GmbH, Nuremberg, Fed. Rep. of Germany

Filed Sep. 29, 1989, Ser. No. 414,509
Claims priority, application Japan, Oct. 4, 1988, 63-130354[U]
Int. Cl.[5] G06K *15/00*
U.S. Cl. 364—519 **18 Claims**

1. A video printing device having a housing and comprising therein:
input means adapted to receive main video signals;
memory means connected to said input means, for selectively storing one of said main video signals and a portion thereof;
video signal generating means for generating auxiliary video signals;
composing circuit means connected to said memory means and to said video signal generating means, for receiving and selectively composing said main video signals and said auxiliary video signals;
display means connected to said composing circuit means for display information according to output signals of said composing circuit means;
printing means connected to said composing circuit means for printing information according to the output signals thereof; and
mode selection means connected to said memory means and operable between a passing mode condition in which said memory means is switched so as to be inoperative and said composing circuit means receive said main video signals from said input means without temporary storage in said memory means, and a second mode condition in which said memory means is switched so as to operative and said composing circuit means receive main video signals stored in said memory means.



5,010,499

DIGITAL DATA CAPTURE FOR USE WITH TV SET OR MONITOR

Keen Y. Yee, 57 Ogden Ave., White Plains, N.Y. 10605

Continuation of Ser. No. 158,592, Feb. 22, 1988, Pat. No. 4,894,789. This application Oct. 30, 1989, Ser. No. 429,078
The portion of the term of this patent subsequent to Jan. 16, 2007, has been disclaimed.
Int. Cl.[5] H04N *7/10*
U.S. Cl. 364—521 **16 Claims**

1. A digital data capture apparatus used by a receiving party and operating in combination with a receiving tv set or monitor having associated therewith an extraction circuit for extracting digital data from a composite video-digital signal received by said tv set or monitor comprising:
a tv set or monitor receiving a composite video-digital signal,
means associated with said tv set or monitor for receiving a composite video-digital signal, said signal including digital data having no addresses associated therewith,
storage means for storing selected digital data under control of instructions directed to a microprocessor, said selected digital data being selectively extracted from said composite signal by said receiving party,

memory means communicating with said microprocessor for storing programs, said selected digital data, and addresses therfor,
a microprocessor for receiving said selected digital data from said extraction circuit, said microprocessor communicating with said memory means and with said storage means for controlling the selected storage, retrieval, and display of said selected digital data, and
a digital-to-video converter for converting siad selected digital data to video signals suitable for display on the screen of said tv set or monitor.

5,010,500

GESTURE-MODIFIED DIAGRAM FOR RETRIEVAL OF IMAGE RESEMBLING DIAGRAM, WITH PARTS SELECTABLE FOR FURTHER INTERACTIVE RETRIEVAL

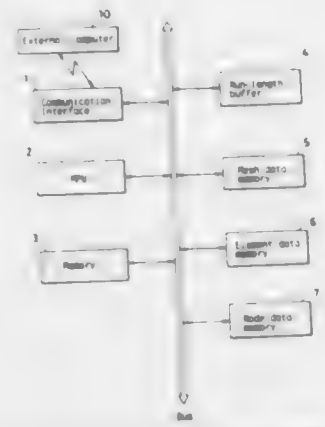
Ranjit Makkuni, San Francisco; Frank Zdybel, Jr., and Robert A. Stults, both of Palo Alto, all of Calif., assignors to Xerox Corporation, Stamford, Conn.

Filed Jan. 26, 1989, Ser. No. 303,351
Int. Cl.[5] G06F *3/14*
U.S. Cl. 364—521 **24 Claims**

1. An information retrieval system comprising:
presenting means for providing presentations to a user, the presenting means comprising display means for providing visual presentations to the user;
selection input means for providing signals indicating user selections within visual presentations provided by the display means;
gesture input means for providing data based on gestures of the user;

memory for storing a plurality of interactive items, the display means being capable of providing a respective interactive presentation based on each of the interactive items; the respective interactive presentations of a first one of the interactive items including a first image, the first image including a plurality of parts including a first part; the memory further being for storing, for each of the parts of the first image, a respective set of related information items based on each of which the presenting means can provide a respective presentation for providing information to the user; the respective set of related information items of the first part including a first information item; the first image further including, for each of the parts, a respective selectable bounded area that is selectable by the user with the selection input means in requesting presentations based on information items from the respective set of related information items;

first means for using visual feature data from the gesture input means to determine whether the first image includes features resembling a desired set of visual features and, if so, for causing the display means to provide the first interactive item's respective interactive presentation that includes the first image; the visual feature data being based on a gesture indicating the desired set of visual features; the visual feature data indicating the gesture's path of motion; and



second means for receiving a request signal requesting the first information item's respective presentation and for responding to the request signal by causing the presenting means to provide the first information item's respective presentation for providing information to the user; the request signal including a selection signal from the selection input means, the selection signal indicating user selection of the first part's respective selectable bounded area.

5,010,501

THREE-DIMENSIONAL GEOMETRY PROCESSING METHOD AND APPARATUS THEREFOR

Yoshiki Arakawa, Yawata, Japan, assignor to Matsushita Electric Industrial Co., Ltd., Kadoma, Japan

Filed Oct. 19, 1988, Ser. No. 259,826
Claims priority, application Japan, Oct. 20, 1987, 62-264411
Int. Cl.[5] G06F *15/62*
U.S. Cl. 364—522 3 Claims

2. A three-dimensional geometry processing apparatus comprising:

a geometry processing computer for creating three-dimensional run-length data representing a three-dimensional object geometry having a surface,

means for dividing an analysis domain enclosing said three-dimensional object geometry into a plurality of elements of three-dimensional geometry having apexes designated as nodes,

means for examining intersection of said elements to said three-dimensional object geometry by using said run-length data,

means for selecting all elements enclosed in said three-dimensional object geometry and all elements intersecting with said surface of said three-dimensional object geometry,

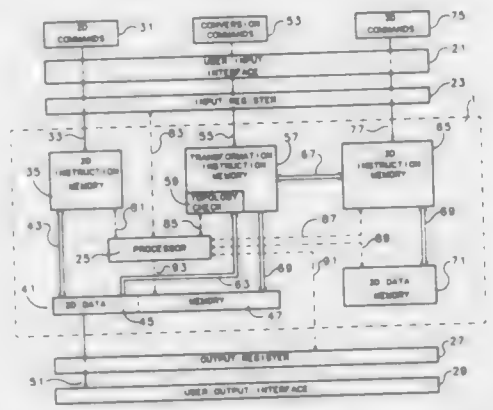
means for creating data of nodes of said selected elements,

means for selecting nodes being present outward from said three-dimensional object geometry of said all elements intersecting with said surface of said three-dimensional object geometry,

means for shifting said nodes being present outward from said three-dimensional object geometry onto the surface of said three-dimensional object geometry on the basis of a first predetermined rule,

means for examining shape of elements which nodes are shifted onto said three-dimensional object geometry,

means for selecting elements conforming to a second predetermined rule, said second predetermined rule being used to select elements that conform to a preselected shape, and



memories for memorizing said three-dimensional run-length data, element data which is topology data of said element, node data represented by coordinate values of said apexes and mesh data for instructing dividing manner of said analysis domain.

5,010,502

METHOD AND APPARATUS FOR GENERATING REPRESENTATIONS OF 3-DIMENSIONAL OBJECTS

Heinz Diebel, Boeblingen; Ralf Peterhoff, Weil im Schoenbuch, and Evelyn Thuemling, Boeblingen, all of Fed. Rep. of Germany, assignors to Hewlett-Packard Company, Palo Alto, Calif.

Continuation of Ser. No. 58,487, Jun. 5, 1987, abandoned. This application Mar. 13, 1990, Ser. No. 494,921
Claims priority, application Fed. Rep. of Germany, Jun. 7, 1986, 86107786
Int. Cl.[5] G06F *15/60*
U.S. Cl. 364—522 5 Claims

1. An apparatus for processing a representation of a three dimensional object and for depicting the representation on a display means, comprising:

an input device;

determination means, coupled to the input device for receiving a command from an input device and for determining whether the command is either a 2D command or a 3D command;

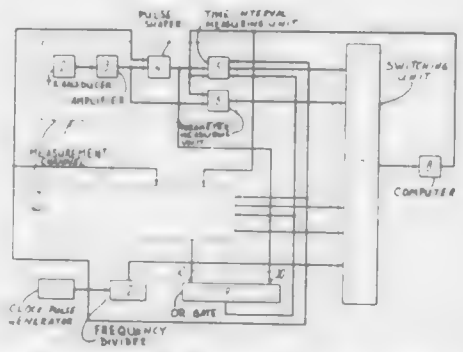
2D processing means, coupled to the determination means and selectable thereby in case that the command is a 2D command, for using the command to process the representation in a 2D mode;

2D memory means, coupled to the 2D processing means, for storing two dimensional data regarding the object; the 2D memory means comprising; a first part which is user accessible and which is operative for receiving the 2D view information; and a second part which is not user accessible and which contains other 2D view information created by a rendering processor;

transformation means, coupled to the determination means and selectable thereby in case that the command is a 3D command, for transforming the two dimensional data stored in the 2D memory means into a three dimensional geometry, the transformation means comprising; a profile processor for transforming 2D geometry into 3D geometry; and the rendering processor for transforming 3D geometry information into 2D view information and for storing the 2D view information in the 2D memory means;

3D processing means, coupled to the transformation means for using the command to process the representation in a 3D mode;

3D memory means, coupled to the transformation and 3D processing means, for storing and receiving three dimensional data regarding the object; and



wherein the display means is coupled to the 2D and 3D memory means for displaying the representation.

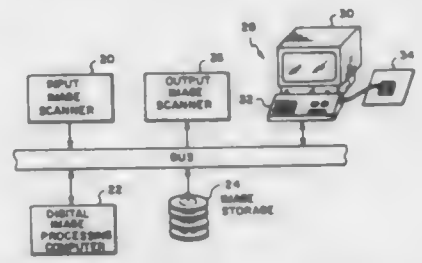
APPARATUS FOR ACOUSTIC-EMISSION INSPECTION OF ARTICLES

Boris E. Paton, Kiev; Vladimir F. Utkin, Dnepropetrovsk; Anatoly Y. Nedoseka, Kiev; Nikolai T. Khromyak, Kiev; Nikolai V. Gorlitsyn, Kiev; Viktor G. Tikhy, Dnepropetrovsk; Evgeny D. Mezintsev, Moscow, and Nikolai N. Mezhuev, Dnepropetrovsk, all of U.S.S.R., assignors to Institut Elektrosvarki Imeni E.O. Patona Akademii Nauk Ukrainskoi SSR, Kiev, U.S.S.R.

PCT No. PCT/US88/00091, § 371 Date Dec. 19, 1989, § 102(e) Date Dec. 19, 1989, PCT Pub. No. WO89/10560, PCT Pub. Date Nov. 2, 1989
PCT Filed Apr. 20, 1988, Ser. No. 449,854
Int. Cl.[5] G01N *29/04*
U.S. Cl. 364—569 2 Claims



1. An apparatus for acoustic-emission inspection of articles, comprising: channels each including a series connection of a transducer of acoustic emission signals, positionable on an article under inspection, and an amplifier of electric signals, having an output connected to a shaper of single pulses and to a unit for measuring parameters of acoustic emission signals, and also a clock pulse generator connected with each channel, a switching unit having inputs connected to outputs of the units for measuring the parameters of acoustic emission signals and also connected with the shapers of single pulses of respective channels, and a computer for processing acoustic-emission data, connected to the switching unit, further comprising, in each channel, a unit for measuring time intervals, having a first input connected to an output of the shaper of single pulses, a second input connected to an output of the clock pulse generator, and an output connected to the input of the switching unit, and also a frequency divider having an input connected to the output of the clock pulse generator and an output connected to the switching unit, and an OR gate having inputs in a number equalling the number of the channels, said inputs of said OR gate being connected to the respective outputs of the shapers of single pulses of each channel, and having an output connected to third inputs of the respective units for measuring time intervals in each channel.

5,010,504

DIGITAL IMAGE NOISE SUPPRESSION METHOD USING SVD BLOCK TRANSFORM

Hsien-Che Lee; Hui-Jung Lee, both of Penfield; Heesun Kwon, Pittsford, and Jeanine Liang, Rochester, all of N.Y., assignors to Eastman Kodak Company, Rochester, N.Y.

PCT No. PCT/US88/00519, § 371 Date Oct. 12, 1989, § 102(e) Date Oct. 12, 1989, PCT Pub. No. WO89/07799, PCT Pub. Date Aug. 24, 1989
PCT Filed Feb. 22, 1988, Ser. No. 435,490
The portion of the term of this patent subsequent to Jul. 31, 2007, has been disclaimed.
Int. Cl.[5] H03F *1/26*
U.S. Cl. 364—574 8 Claims

1. A method of processing an image in a digital computer for reducing noise in the image, comprising the steps of:

(a) generating a nonlinear gain function based upon the measured statistics of the SVD singular values for image noise;

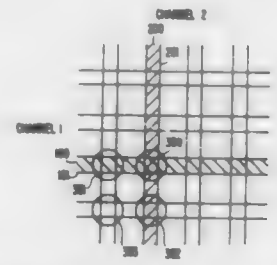
(b) filtering the digital image to produce a detail image and a low pass filtering image;

(c) dividing the detail image into blocks;

(d) transforming the blocks employing an SVD transformation to produce singular vectors and arrays of singular values;

(e) applying the nonlinear gain function to the arrays of singular values to produce arrays of modified singular values;

(f) performing an inverse SVD on the singular vectors with modified singular values to produce blocks of processed detail image values; and

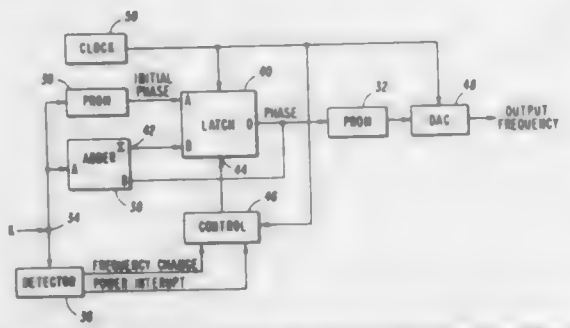


(g) combining the processed image detail values with the low pass filtered image values to produce the processed digital image.

5,010,505

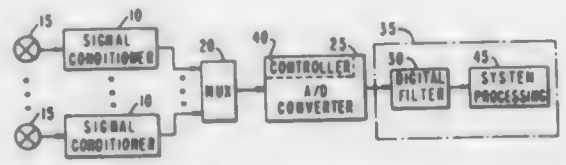
OPTICAL CROSS BAR ARITHMETIC/LOGIC UNIT

R. A. Falk, Renton; C. D. Capps, and T. L. Houk, both of Seattle, all of Wash., assignors to The Boeing Company, Seattle, Wash.



Filed Feb. 27, 1987, Ser. No. 19,761
Int. Cl.[5] G06E *1/04*
U.S. Cl. 364—713 26 Claims

3. Apparatus for performing arithmetic operations in residue arithmetic comprising:



(a) a first plurality of light sources corresponding in number to N wherein N is a given modulus;
(b) a second plurality of light sources corresponding in number to N;
(c) means for energizing a first one of said first plurality of light sources corresponding to the residue of a first number modulo said given modulus;
(d) means for energizing a second one of said second plurality of light sources corresponding to the residue of a second number modulo said given modulus;
(e) means for directing light from said first and second energized ones of said light sources to intersect each other in an intersecting region;
(f) means for detecting light intensity at said intersecting region; and
(g) means for discriminating at said intersecting region between:
(1) a first state, wherein a first level of light intensity is detected resulting from light transmitted to the detecting means from only one or none of said first and second energized ones of said light sources, and
(2) a second state, wherein a second level of light intensity is detected resulting from light transmitted to the detecting means from both of said first and second energized ones of said light sources, wherein said first and second states indicate an output state of the arithmetic operation.

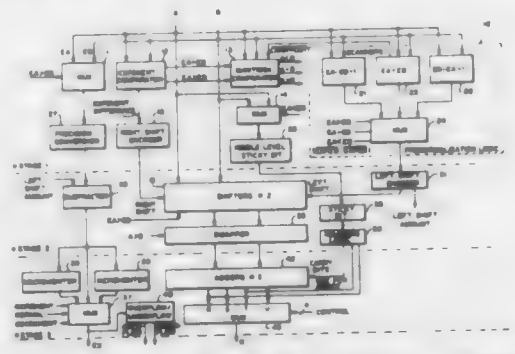
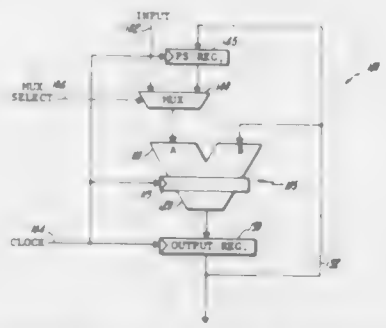
SPURIOUS LEVEL REDUCTION AND CONTROL METHOD FOR DIRECT DIGITAL SYNTHESIZERS
Dennis J. Hracirik, Hiawatha, Iowa, assignor to Rockwell International Corporation, El Segundo, Calif.
Filed Jan. 19, 1989, Ser. No. 369,414
Int. Cl.[5] G06F 15/31
U.S. Cl. 364—721 12 Claims



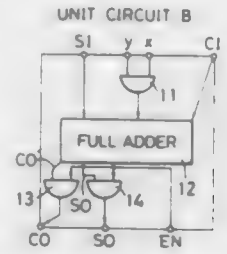
1. A direct digital synthesizer that outputs at least a predetermined output frequency related signal from a received digital signal, K, comprising:
means for permanently storing for continuing reference an initial phase value of the digital signal, K, said means for storing providing said initial phase value on an output thereof;
means for adding having a first input for receiving said digital signal, K, having a second input, and having an output which provides a summation of signals received on said first and second inputs;
means for latching having a first input connected to said output of said means for storing said initial phase value, having a second input connected to said output of said means for adding and having an output connected to said second input of said means for adding, said means for latching also having a third input for receiving a select signal for selecting between receiving on said first and second inputs of said means for latching;
means for detecting changes in predetermined parameters related to spurious signal levels in the output of said direct digital synthesizer and generating a spurious level detect signal;
means for providing said select signal in response to said spurious level detect signal indicative of changes in said predetermined parameters; and
said output frequency related signal being provided on said output of said means for latching.

5,010,507
SAMPLED DIGITAL FILTER SYSTEM
Thomas J. Kenny, Plum Borough, Pa., assignor to Westinghouse Electrical Corp., Pittsburgh, Pa.
Filed Jan. 25, 1989, Ser. No. 301,406
Int. Cl.[5] G06F 15/31
U.S. Cl. 364—724.01 6 Claims



1. A sampled digital filter system for processing an input signal including an unwanted signal component, said system comprising:
sampling means having first and second sampling intervals, for receiving the input signal, for sampling the input signal with said second sampling interval for a limited time within said first sampling interval and for providing samples of the input signal as input samples; and
digital filter means for digital filtering the input samples so as to provide a filtered output corresponding to the input signal with the unwanted signal component filtered out.

5,010,508
PRENORMALIZATION FOR A FLOATING-POINT ADDER
Hon P. Sit, Fremont; David Galbi, Mountain View, and Alfred K. Chan, San Jose, all of Calif., assignors to Intel Corporation, Santa Clara, Calif.
Filed Feb. 14, 1989, Ser. No. 311,294
Int. Cl.[5] G06F 5/01, 7/50
U.S. Cl. 364—748 16 Claims

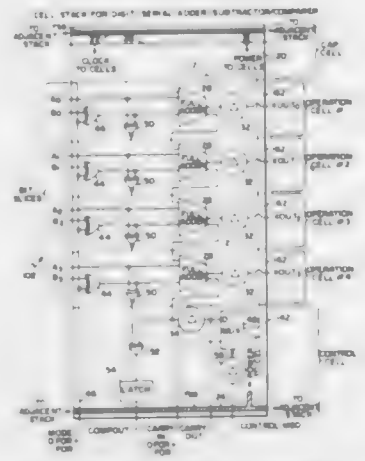


1. In a floating-point adder for performing a subtraction operation by subtracting a first operand from a second operand to obtain a difference, a prenormalization circuit for prenormalizing mantissas of said operands prior to performing said subtraction operation, comprising:
a first logic circuit coupled to receive mantissas of said operands for logically operating on said mantissas to predict a number of leading 0s in a resultant mantissa of said difference if said exponent value of said first operand is greater in magnitude than said exponent value of said second operand by a value of one;
a second logic circuit coupled to receive mantissas of said operands for logically operating on said mantissas to predict a number of leading 0s in said resultant mantissa if said exponent value of said second operand is greater in magnitude than said exponent value of said first operand by a value of one;
a third logic circuit coupled to receive mantissas of said operands for logically operating on said mantissas to predict a number of leading 0s in said resultant mantissa if said exponent values of said operands are equal;
shifter means coupled to receive said mantissas of said operands and outputs from said first, second and third logic circuits for shifting said operands to prevent leading 0s from occurring in said resultant mantissa;
wherein said exponent value of said first operand is greater in magnitude than said exponent value of said second operand by a value of one, said shifter means causes each of said operands to be shifted by a number determined by said output of said first logic circuit;
if said exponent value of said second operand is greater in magnitude than said exponent value of said first operand by a value of one, said shifter means causes each of said operands to be shifted by a number determined by said output of said second logic circuit; and
if said exponent value of said operands are equal, said shifter means causes each of said operands to be shifted by a number determined by said output of said third logic circuit;
said shifted operands provide said resultant mantissa which does not require post-normalization.

5,010,509
ACCUMULATOR FOR COMPLEX NUMBERS
Roger G. Cox; Mark A. Reber, and Michael W. Yeager, all of Colorado Springs, Colo., assignors to United Technologies Corporation, Hartford, Conn.
Filed Oct. 5, 1988, Ser. No. 253,817
Int. Cl.[5] G06F 7/38, 7/50
U.S. Cl. 364—748 3 Claims

1. An integrated circuit accumulator comprising an adder having first and second input ports, combinational logic means having a set of adder modules for adding first and second input numbers presented to said input ports to form a sum, and an output register means for transferring said sum to said second input port for further addition, said combination logic means being connected between said first and second ports and said output register means characterized in that:
said combinational logic means includes therein first and second portions of combinational logic means and an intermediate storage means connected therebetween, intermediate storage means for storing intermediate data comprising an intermediate form of a partially completed addition operation and having a sum portion containing at least one sum register for storing at least one low order sum bit representing a sum of corresponding low order bits of said first and second numbers, a carry portion for storing a carry bit from the highest one of said at least one sum register and further having a data portion containing at least one pair of data registers for storing high order pairs of bits of said first and second numbers, whereby said adder is divided into said first portion before said intermediate register and said second portion after said register; and
means for loading a third input number into said first input port and means for transferring a fourth input number from said output register means into said second input port when said intermediate data is in said intermediate storage means, whereby said second portion of said adder performs steps in the addition of said first and second numbers and said first portion of said after performs steps in the addition of said third and fourth numbers simultaneously.

5,010,510
MULTIPLYING UNIT CIRCUIT
Eiichi Nishimura; Takao Nakamura, and Hisaki Ishida, all of Tokyo, Japan, assignors to Oki Electric Industry Co., Ltd., Japan
Division of Ser. No. 300,492, Jan. 20, 1989. This application Sep. 7, 1990, Ser. No. 579,343
Claims priority, application Japan, Jan. 25, 1988, 63-14184
Int. Cl.[5] G06F 7/52
U.S. Cl. 364—758 4 Claims



1. A multiplying unit circuit for performing a multiplication operation on a multiplicand input and a multiplier input, comprising:
a one-bit multiplicand input terminal for receiving a one-bit multiplicand input;
a one-bit multiplicand input terminal for receiving a one-bit multiplier input;
a bit multiplication circuit performing bit multiplication on said multiplicand input and said multiplier input to generate a bit product;
a one-bit sum input terminal for receiving a one-bit sum input;
a one-bit carry input terminal for receiving a one-bit carry input;
a full adder for receiving said bit product, said sum input, and said carry input, and performing bit addition thereon to generate a one-bit sum output and a one-bit carry output;
said sum output and said carry output assuming a first state and a second state to represent a binary bit, power consumption being lower in said first state than in said second state;
an enable signal input terminal for receiving enable signals having active state and inactive state; and
a keeping means for keeping said sum output and said carry output in said first state while said enable signal input is in the inactive state.

5,010,511
DIGIT-SERIAL LINEAR COMBINING APPARATUS USEFUL IN DIVIDERS

Richard I. Hartley, Schenectady, N.Y., and Peter F. Corbett, Princeton, N.J., assignors to General Electric Company, Schenectady, N.Y.

Continuation-in-part of Ser. No. 182,602, Apr. 18, 1988, Pat. No. 4,951,221. This application Oct. 31, 1988, Ser. No. 265,210
Int. Cl.[5] **G06F** *7/50, 7/52*
U.S. Cl. 364—786 **58 Claims**

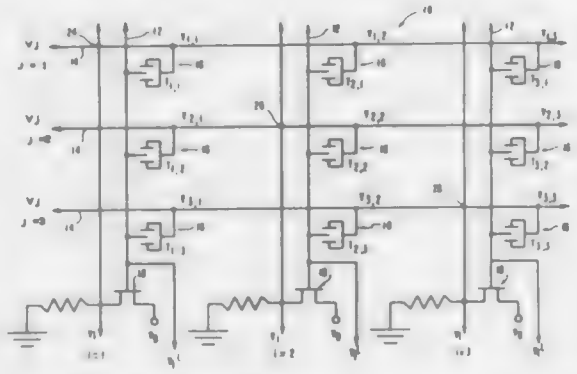
1. Linear combining apparatus for digit-serial first and second operands each having words of W bits simultaneously supplied during respective clock intervals as successive W/n digits of n bits apiece in an efficient arithmetic, n being a plural integer and W being a multiple at least two of n, the less significant digits of each word preceding the more significant digits, the sign bit if any of each word included in its most significant digit, the bits of each digit being respectively identified by consecutive ordinal numbers first through n^{th} in order of their increasing significance, said linear combining apparatus comprising:

a plurality n in number of full adders respectively identified by consecutive ordinal numbers first through n^{th}, each full adder having a respective augend input port for receiving the bits of said first operand digits identified by the same ordinal number as that full adder, each full adder having a respective addend input port for receiving the bits of said second operand digits identified by the same ordinal number as that full adder, each full adder having a carry input port and a sum output port and a carry output port, the carry output port of each of said plurality of full adders except the nth being connected to the carry input port of the one of said plurality of full adders that is identified by the next higher ordinal number;

means for supplying a digit-serial output signal responsive to the bits supplied at the sum output ports of said first through n^{th} full adders;

selection apparatus for selecting a forced carry bit to the carry input port of said first full adder during the first digits of words of said first and second operands and for otherwise selecting the bit supplied at the carry output port of said n^{th} full adder as delayed by one clock interval to the carry input port of said first full adder;

a (n+1)th unit-clock-delay element included in said selection apparatus, having an input port to which the carry output port of said n^{th} full adder connects, and having an output port; and



a multiplexer included in said selection apparatus, having a first input port connected to the output port of said first unit-clock-delay element, having a second input port connected for receiving said forced carry bit, having an output port connected to the carry input port of said first full adder, responding to a control signal being in a first state thereof during all digits of said digit-serial operands except the first digits to select the bit supplied to its first input port to its output port, and responding to said control signal being in a second state thereof during only the first digits of said digit-serial operands to select the forced carry bit supplied to its second input port to its output port; and

selective complementing apparatus for generating said second operands as the equals of or as the one's complements of third digit-serial operands, depending on whether a mode signal is a ZERO or is a ONE, in which said linear combining apparatus said mode signal is applied to the second input port of said multiplexer to cause said linear combining apparatus to be operative as an adder when said mode signal is a ZERO and to be operative as a subtractor when said mode signal is a ONE.

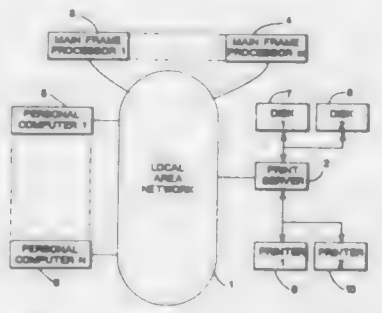
1. A recording apparatus for recording an image transmitted from a host in the form of code data and control data, comprising:

conversion means for converting the code data transmitted from the host into image data;

a first random access memory capable of storing therein the image data converted by said conversion means and the control data, the image data and the control data being stored in accordance with address data transmitted from the host, the address data representing which area of said first random access memory stores the image data and which area stores the control data;

data processing means for conducting write-processing in an overlapping manner on image data previously stored in said first random access memory and on image data newly entered into said apparatus, and for storing the processed data in said first random access memory;



recording means for recording the image data which has been write-processed in the overlapping manner by said data processing means and stored in said first random access memory; and

control means for controlling said data processing means such that said data processing means can conduct the write-processing in the overlapping manner in response to address data transmitted from the host that represents the area of said first random access memory which stores image data and said data processing means cannot conduct write-processing in the overlapping manner in response to address data transmitted from the host that represents the area of said first random access memory which stores control data.

STRUCTURED FIELDS AT A DATA STREAM BOUNDARY FOR DELIMITING FILES

B. William Kippenhan, and Andrew W. Maholick, both of Raleigh, N.C., assignors to International Business Machines Corporation, Armonk, N.Y.

Filed Apr. 26, 1989, Ser. No. 344,178
Int. Cl.[5] **G06F** *3/12*
U.S. Cl. 364—900 **10 Claims**

1 In a computer network having a plurality of host processors and microprocessors collectively referred to as sender devices, a plurality of printer devices, and at least one print server referred to as a receiver device, a method for delineating the beginning and the end of a data file sent to a print server for spooling to a target printer device, said method comprising:

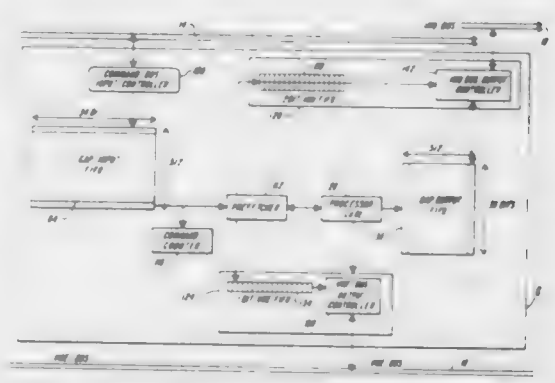
sending an inquiry from the sender device to the print server to determine the functional capabilities of the target printer device;

returning a response from said print server to the sender device indicating the functions supported by the target printer device;

appending a beginning of file structured data field to the beginning of the data stream to form a modified data stream to be sent to the print server;

transmitting said modified data stream to said print server;

appending an end of file structured data field to the end of the modified data stream and transmitting said structured field to said print server;



examining and processing said modified data stream to extract the beginning of file and end of file structured data fields; and

sending the file contained in the data stream to the target printer device for printing.

PARALLEL GRAPHICS PROCESSOR WITH WORKLOAD DISTRIBUTING AND DEPENDENCY MECHANISMS AND METHOD FOR DISTRIBUTING WORKLOAD

John G. Torborg, Jr., Carlisle, Mass., assignor to Raster Technologies, Inc., Westford, Mass.

Continuation of Ser. No. 78,874, Jul. 28, 1987, abandoned. This application Sep. 11, 1990, Ser. No. 581,401
Int. Cl.[5] **G06F** *15/16*
U.S. Cl. 364—900 **31 Claims**

1. An apparatus for generating and manipulating graphic images in accordance with instructions from an operator, transmitted through an input device to a first processor which generates a first, ordered sequence of commands, and sends each command of the first sequence over a command bus to a plurality of graphic arithmetic processors, designated as GAPs, which each has a GAP first in first out (designated as "FIFO") input memory and which GAPs generate together a second sequence of commands that are transmitted over an image memory unit bus (designated as "IMU Bus") to an image memory unit, comprising:

a. for each GAP a command bus input controller for establishing a plurality of GAP arbitration priority levels corresponding to a plurality of degrees of GAP input FIFO emptiness and for arbitrating among the GAPs so that one GAP which has a GAP input FIFO, as compared to which no other GAP's input FIFO is more empty, receives a command of the first sequence;

b. for each GAP, means for the command bus input controller to communicate FIFO emptiness signals with the command bus input controller of each other GAP over the command bus; and

c. means for storing order information for all commands of the first sequence which have not yet been executed; and

d. for each GAP, means for transmitting commands of the

second sequence from said GAP to the image memory unit according to an order based upon the stored order information and substance of the first sequence of commands.

7. A dynamic semiconductor memory device having a small occupied area, comprising:
a plurality of memory cells arranged in at least one column for storing information,
at least one write bit line provided corresponding to each column of said plurality of memory cells,
at least one read bit line provided corresponding to each column of said plurality of memory cells,
a plurality of first selecting lines each provided corresponding to each of said memory cells in said each column,
a plurality of second selecting lines each provided corresponding to each of said memory cells in said each column,

first selecting means for applying a write selecting signal to any of said plurality of first selecting lines, and
second selecting means for applying a read selecting signal to any of said plurality of second selecting lines,
each of said memory cells comprising
capacitance means for storing information,
a first transistor connected between said write bit line and said capacitance means and responsive to said write selecting signal applied to corresponding one of said first selecting lines for transferring information applied through said write bit line to said capacitance means, and
a second transistor connected between said read bit line and said capacitance means and responsive to said read selecting signal applied to corresponding one of said second selecting lines for transferring information stored in said capacitance means to said read bit line.

SONAR TEST SYSTEM AND METHOD
Dale D. Skinner, and John H. Thompson, both of Severna Park, Md., assignors to Westinghouse Electric Corp., Pittsburgh, Pa.
Filed Jan. 2, 1990, Ser. No. 459,861
Int. Cl.[5] H04B *17/00*
U.S. Cl. 367—13 **9 Claims**

1. Apparatus for testing a transducer array, comprising:
(A) a test transducer;
(B) a drive mechanism for positioning said test transducer over said array;
(C) an acoustic coupling medium disposed between said test transducer and said array;
(D) signal generating means for providing said test transducer with a simulated flow noise signal;
(E) said test transducer being operable to transmit a corresponding acoustic signal across said medium toward said array;
(F) means for storing the resultant output signals of all of the transducers of said array in response to receipt of said acoustic signal;

(G) means for providing said drive mechanism with a drive signal to move said test transducer to different predetermined positions over said array for projection of said acoustic signal; and

(H) means for combining and processing all of said output signals of the transducers of said array, for all transmissions of said test transducer, to derive an array output response signal for analysis purposes.

METHOD OF DIGITAL FILTERING
Andrew F. Linville, Jr., Dallas, and Thomas E. Shirley, Richardson, both of Tex., assignors to Mobil Oil Corporation, Fairfax, Va.
Filed Jul. 30, 1990, Ser. No. 560,409
Int. Cl.[5] G01V *1/28, 1/36*
U.S. Cl. 367—46 **10 Claims**

6. A method of removing noise components from seismic data recorded in seismic exploration wherein seismic energy sources are activated at spaced locations along a line of exploration, and signals responsive to reflection of the seismic energy within the earth are recorded as a function of time at spaced locations along the line of exploration to produce a series of seismic traces, said seismic traces comprising seismic data components and noise components, said method comprising the steps of:
determining the frequency of energy to be filtered from the records;
choosing the bandwidth of the filter to be applied;
selecting a filter order n;
computing the exact autocorrelation function for one or more bands of energy to be filtered according to the following equation:

$$R_x(\tau) = B\left[\frac{\sin \pi B\tau}{\pi B\tau}\right]\cos(2\pi f_0\tau)$$

wherein:
$R_x(\tau)$ is the exact autocorrelation function of the noise;
B is the bandwidth of the noise to be removed;
f_0 is the center frequency of the band of noise to be removed; and
τ is 0, 1, . . . n−1;
using the autocorrelation function $R_x(\tau)$ thus determined to generate a series of filter coefficients $h_0, h_1, \ldots h_{n-1}$; and
applying said filter coefficients $h_0, h_1, \ldots h_{n-1}$ to the data to filter out the undesired frequency components.

5,010,527
METHOD FOR DETERMINING THE DEPTH OF A HYDRAULIC FRACTURE ZONE IN THE EARTH
Kenneth D. Mahrer, Dallas, Tex., assignor to Gas Research Institute, Chicago, Ill.
Filed Nov. 29, 1988, Ser. No. 277,559
Int. Cl.[5] G01V *1/40*
U.S. Cl. 367—86 **40 Claims**

27. The method of determining the depth of a zone of hydraulic fracture proximate to a wellbore following the application of hydraulic pressure within the bore of a well to cause fracturing in the geological environment around the bore, comprising:
a. while the wellbore is still pressurized, positioning a motion detector at spaced depths within the bore during a time following the cessation of the application of hydraulic pressure, such depths extending vertically beyond at least one vertical limit of the zone of the anticipated vertical extent of the fracture,
b. sensing and recording seismic wave motion for a period of time at each depth, such wave motion having a combined pre-pressurization plus pressure-induced background level with two horizontal components and a vertical component and having motion components from sources not attributable to the fracturing, and having discrete signal components from sources attributable to the fracturing,
c. analyzing such motion recordings at each depth, including
(1) eliminating motion components not attributable to the fracturing,
(2) eliminating discrete signal components from sources attributable to the fracturing,
(3) determining the average background level of the two combined horizontal components and of the vertical component of motion as measured by the motion detector,
(4) and comparing the average background level of motion for the combined horizontal components of motion

to the vertical component of motion, whereby the ratio of the horizontal to the vertical components provides an indication of the presence or absence of fracturing at such depth.

U.S. Cl. 367—90 **4 Claims**

1. A Doppler flow velocity measuring apparatus, comprising:

a means for obtaining a Doppler velocity distribution in the direction of a beam by utilizing a Doppler effect obtained from the echo reflected from a fluid when an ultrasonic wave or an electromagnetic wave is transmitted to and received from said fluid and scanning a desired transverse section with reflected echo;

a first memory means for storing the Doppler velocity distribution;

a means for obtaining a stream function by reading out the stored Doppler velocity in a direction orthogonal to the direction of said beam and cumulatively integrating said Doppler velocity at each point;

a second memory means for two-dimensionally storing said stream function obtained; and

a means for obtaining the velocity component in the scanning plane which is orthogonal to the direction of said beam by reading out the stream function distribution in the direction of said beam and differentiating said stream function distribution in the direction of said beam.

MAGNETIC COUPLER FOR ELECTROACOUSTIC HYDROPHONES

Thomas P. Riley, Westport, Mass., assignor to The United States of America as represented by the Secretary of the Navy, Washington, D.C.

Filed Jun. 26, 1990, Ser. No. 544,574

Int. Cl.[5] G01V *1/38*

U.S. Cl. 367—154 **7 Claims**

1. A magnetic coupler for coupling a plurality of electroacoustic transducers to a trunk cable which comprises:

a split magnetic core including at least two sections, a first section and a second section;

a pair of encapsulants, first encapsulant for said first section of said split magnetic core and a second encapsulant for said second section of said split magnetic core, forming encapsulated first and second sections of said split magnetic core;

fastener means for mounting said first and second encapsulated sections of said split magnetic core around said trunk cable at any preselected points thereof, thus coupling said encapsulated second section of said split magnetic core thereto;

a plurality of electronic processors including power source for supplying power to each of said plurality of electroacoustic transducers;

means for connecting an output of a member of said plurality of transducers to a corresponding member of said plurality of electronic processors; and

means for coupling an output of a member of said plurality of electronic processors to said encapsulated first section of said split magnetic core.

1. A method for intermittently recording and/or reproducing information on or from an optical recording medium hav-

ing a plurality of tracks, in accordance with control of a controller, the method comprising the steps of:

moving a light beam from a home position to a desired track on the recording medium;

effecting information recording or reproduction by scanning the desired track with the light beam;

placing and maintaining the light beam in a stand-by state in which the light beam is applied to the desired track without being returned to the home position, after the termination of the information recording or reproduction;

starting a next information recording or reproduction operation with the light beam being applied to the medium, when the controller commands the next information recording or reproduction operation before the lapse of a predetermined time in the stand-by state; and

terminating the application of the light beam to the recording medium, when the controller gives no command for commencing the next information recording or reproduction operation after the lapse of the predetermined time in the stand-by state.

APPARATUS AND PROCESS FOR MEASURING DATA DISK RUNOUT AND ACCELERATION PARAMETERS

Mark L. Davis, Loveland, Colo., assignor to Hewlett-Packard Company, Palo Alto, Calif.

Filed Jan. 19, 1989, Ser. No. 299,361

Int. Cl.[5] G11B *17/00, 21/10*

U.S. Cl. 369—32 **11 Claims**

11. In a disk drive for exchanging data with a media having circular data tracks through a transducer element which is positioned in proximity to the data tracks for interchanging data information therewith with the physical orientation of the transducer element controlled by a servo loop having a disk drive actuator responsive to an error signal produced by a comparator which compares a reference signal defining a selected transducer-to-track relationship with a signal reflecting an actual transducer position with respect to the track, apparatus for indicating the amount of offset of a selected track from ideal circularity comprising

a low pass filter network including an amplifier and a feedback circuit for simulating a transfer function of the disk drive actuator,

means coupling the error signal to an input of said low pass filter,

amplifying means for receiving an output signal of said low pass filter to amplify said output signal,

means for receiving an output of said amplifying means for indicating the runout of a track corresponding to the reference signal which established the error signal, and

means for adjusting the gain of said amplifying means for calibrating said output thereof.

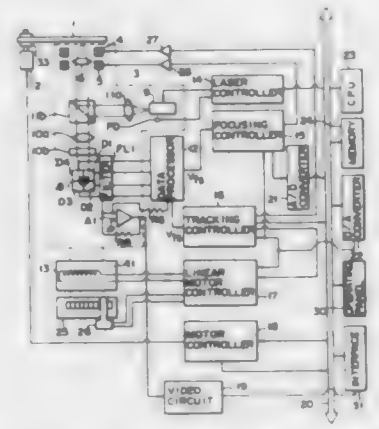
U.S. Cl. 369—50 **5 Claims**

1. In an apparatus for recording and reproducing information on and from an optical disk, having an optical head wherein said optical disk is irradiated by a information bearing light beam, said apparatus comprising:

rotational driving means for rotating said optical disk;

reproduction means for reproducing information recorded on said optical disk to output reproduced signals;
position detection means for detecting the radial position of a region of said disk irradiated by said light beam;
first control means responsive to said position detection means for producing a first control signal and for controlling the rotational speed of said rotational driving means using said detected radial position;
judging means for judging whether or not said output reproduced signals are reproduced from a region of said optical disk where information has been already recorded;



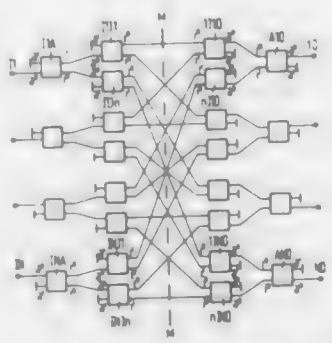
second control means for producing a second control signal and for controlling the rotational speed of said rotational driving means, on the basis of said reproduced signals; and
switch means responsive to said judging means for controlling said rotational driving means by said first control signal when said reproduced signals are not reproduced from a region where information has been already recorded, and controlled by said second control signal when said reproduced signals are reproduced from a region where information has been already recorded.

5,010,541

APPARATUS HAVING A MOVABLE PORTION AND A FIXED PORTION FOR REPRODUCING DATA FROM AN OPTICAL DISK BY A LIGHT BEAM

Ryoji Takeuchi, Yokohama, Japan, assignor to Kabushiki Kaisha Toshiba, Kawasaki, Japan

Filed Dec. 23, 1988, Ser. No. 289,128
Claims priority, application Japan, Dec. 26, 1987, 62-330492
Int. Cl.[5] G11B *7/00*
U.S. Cl. 369—107 **13 Claims**



1. An apparatus for reproducing stored data from an optical disk by a light beam, the apparatus having a movable portion and a fixed portion, comprising:
a housing disposed on the movable portion of the apparatus and movable in a radial direction of the optical disk, said housing having
means for directing the light beam onto the optical disk such that at least a portion of the light beam is reflected from the optical disk,
means for detecting the light beam reflected from the optical disk and for generating an electrical signal corresponding to the detected light beam,
means for dividing the electrical signal generated by the detecting means into a low frequency component and a high frequency component representative of the stored data, and
means for amplifying the high frequency component;
means for moving the housing in the radial direction of the optical disk;
means, disposed on the fixed portion of the apparatus and responsive to the low frequency component, for adjusting a distance between the directing means and the optical disk; and
means, responsive to the amplifying means, for outputting the stored data from the optical disk.

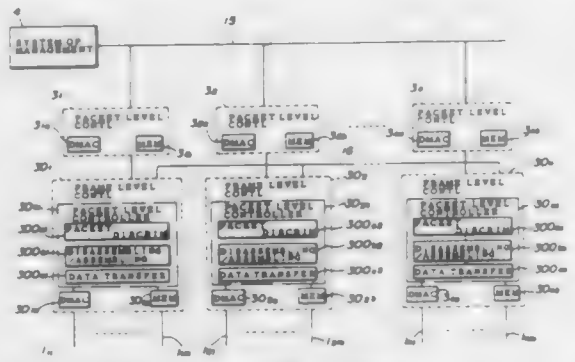
ASYNCHRONOUS TIME-DIVISION MULTISERVICE DIGITAL SATELLITE CENTER FOR CONNECTING SUBSCRIBERS

Jean-Baptiste Jacob, Saint-Guay-Perros, France, assignor to Alcatel Cit, Paris, France



Filed Apr. 10, 1990, Ser. No. 507,418
Claims priority, application France, Apr. 13, 1989, 89 04907
Int. Cl.[5] H04Q *11/00*
U.S. Cl. 370—56 **6 Claims**

1. An asynchronous time division multiservice digital satellite center for connecting analog and digital subscribers, the center comprising a digital control unit and digital concentrators of at least one of the following types: local, distant, and versatile distant for connecting subscribers over metal wire lines, with the digital control unit being connected by multiplex links to the concentrators and to a parent digital exchange, wherein said multiplex links are asynchronous multiplex links conveying information packets designated cells, wherein the concentrators are multiservice concentrators delivering information received from subscribers in the form of the cells and transmitting information to subscribers taken from the cells,

and wherein the digital control unit is a multiservice control unit comprising a multiservice switching network for switching the cells, and connected to the multiservice concentrators and to the parent digital exchange via said asynchronous multiplex links, and a control station connected to the multiservice switching network for controlling said cells.

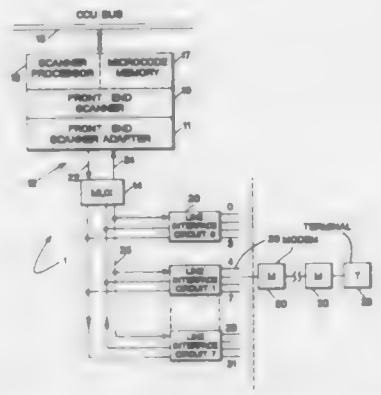
PACKET SWITCHING SYSTEM
Masaaki Kato, Kawagai, Japan, assignor to Fujitsu Limited, Kawasaki, Japan
Filed Jun. 15, 1989, Ser. No. 366,485
Claims priority, application Japan, Jun. 20, 1988, 63-151865
Int. Cl.[5] H04J 3/26
U.S. Cl. 370—85.11 14 Claims



1. A packet switching system comprising:
a plurality of communication lines;
at least first and second data control means respectively connected to first and second groups of said communication lines;
at least first and second packet control means respectively connected to said first and second data control means;
a first bus connecting said first and second packet control means; and
a second bus connecting said first and second data control means,
said first and second data control means having identical construction and each comprising packet discriminating means for discriminating a type of packet received, packet disassembling/assembling means for disassembling a data packet into a header portion and a data portion and for assembling the disassembled header portion and data portion into the data packet, and data transfer means for controlling transfer of packets,
in said first data control means said packet discriminating means discriminating the type of packet received from a communication line within said first group of communication lines which is connected to said first data control means, said packet disassembling/assembling means disassembling the received packet into a header portion and a data portion when said packet discriminating means discriminates the received packet as being a data packet, and said data transfer means transferring the header portion to said first packet control means and the data portion to said second data control means via said second bus,
said first packet control means transferring the header portion to said second packet control means via said first bus, said second packet control means transferring the header portion to said second data control means,
in said second data control means said packet disassembling/assembling means assembling the header portion received from said second packet control means and the data portion received via said second bus into the data packet, and said data transfer means transferring the assembled data packet on a communication line within said second group of communication lines which is connected to said second data control means.

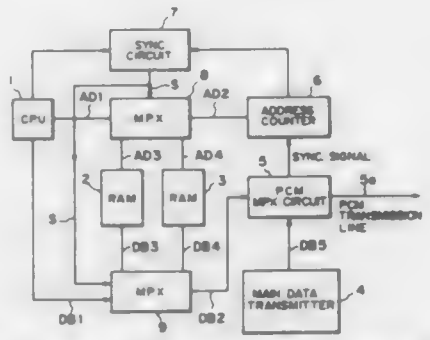
MULTIPLE MESSAGING USING A SINGLE SELECTIVE CALL ADDRESS
Richard E. Johnson, Lake Worth; Amy R. Kabcenell, Highland Beach, and Joan S. DeLuca, Boca Raton, all of Fla., assignors to Motorola, Inc., Schaumburg, Ill.
Filed Jul. 10, 1989, Ser. No. 377,649
Int. Cl.[5] H04J 3/26
U.S. Cl. 370—94.1 18 Claims



1. A method for receiving information by a selected selective call receiver from a single transmission comprising the steps of:
locating message storage instructions in said information, and
storing a message associated with said message storage instructions by appending said message to existing data in a specific memory area in accordance with said message storage instructions.

5,010,548
SCANNER INTERFACE FOR THE LINE ADAPTERS OF A COMMUNICATION CONTROLLER
Yves Granger, Antibes, and Daniel Wind, La Trinite, both of France, assignors to IBM Corporation, Armonk, N.Y.
Filed Jan. 17, 1989, Ser. No. 297,730
Int. Cl.[5] G06F 13/38
U.S. Cl. 370—95.1 8 Claims

1. A line adapter (1) of a communications controller, for exchanging data and control information between line interface circuits, LICs, (20) connected to external transmission lines (26) and the central control unit, CCU, of the communications controller, said line adapter including, for scanning the lines (26), cyclic scanning means FES (10) exchanging information with the LICs (20) through a bidirectional, inbound-outbound, serial link (12) on which data and control informations are partitioned into frames comprised of data slots and control slots, each pair of data and control slots being dedicated to a determined line (26), line-adapter (1) being characterized in that:
the scanning means FES (10) and serial link (12) are being operated independently according to their own timings, said scanning means including a front end scanner adapter interface, FESA, (11), for interfacing said cyclic scanning means FES (10) with said bidirectional serial link (12).

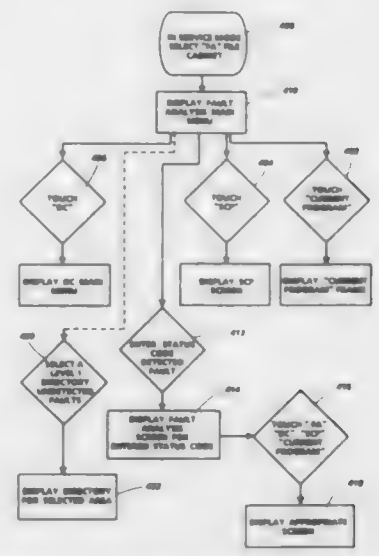
PACKET DATA GENERATOR
Hiromi Katou, Atsugi, and Hirokazu Kobayashi, Saitama, both of Japan, assignors to Kabushiki Kaisha Kenwood, Tokyo, Japan
Filed Apr. 20, 1989, Ser. No. 340,811
Claims priority, application Japan, Apr. 23, 1988, 63-99350
Int. Cl.[5] H04J 3/12, 3/24
U.S. Cl. 370—110.1 2 Claims

1. Data transmission system including a PCM main data source for generating a PCM main data, a PCM additional data source for generating a PCM additional data and a multiplexer for multiplexing the PCM main data and additional data in a predetermined rate for transmission, said PCM additional data source comprising:
first and second memories for storing the PCM additional data;
a processor unit that is operative in a different rate from said predetermined rate for recruiting the PCM additional data stored in the memories; and
an address counter that is operative in synchronization with said predetermined rate of said multiplexer for generating addresses to be applied to one of said memories;
wherein one of said first and second memories is connected to said address counter and multiplexer so that the PCM input data stored in said one memory is read-out with the addressing by said address counter in synchronization with said predetermined rate and supplied to said multiplexer for transmission; and
the other of said first and second memories in response to a request of requiring a PCM input data to be transmitted, is connected to said processor unit so that the PCM input data stored in the other memory is rewritten with the addressing and data provided by said processor unit operating in said different rate, and in response to the completion of the rewriting is then connected to said address counter and multiplexer in place of said one memory.



5,010,550
TRANSMISSION LINE SWITCHING SYSTEM
Yoshimi Hirata, Tokyo, Japan, assignor to NEC Corporation, Japan
Filed Feb. 2, 1989, Ser. No. 305,927
Claims priority, application Japan, Feb. 4, 1988, 63-22916
Int. Cl.[5] G06F 11/20
U.S. Cl. 371—8.2 6 Claims

1. A transmission line switching system, comprising:
(A) a first plurality of normal transmission lines extending between first and second remote stations;
(B) a second plurality of standby transmission lines extending between said first and second remote stations; and
(C) control means for switching transmission between said normal and standby transmission lines as a function of the condition of said normal transmission lines, said control means:
(1) monitoring the condition of said normal transmission lines;
(2) upon detection of a failure in one of said normal transmission lines selecting one of said standby transmission lines and sending a control signal from said first station to said second station and then back to said first station over said selected standby transmission line; and

(3) if said control signal is received at said first station and indicates that said selected standby transmission line has not failed, causing transmission to be switched from said failed normal transmission line to said selected standby transmission line.

5,010,551
SELF CONTAINED TROUBLESHOOTING AID FOR DECLARED AND NON DECLARED MACHINE PROBLEMS
Alan Goldsmith, Fairport, and Hugh O. Forbes, Rochester, both of N.Y., assignors to Xerox Corporation, Stamford, Conn.
Filed Apr. 14, 1989, Ser. No. 339,462
Int. Cl.[5] G06F 11/00; G01R 31/28
U.S. Cl. 371—16.4 9 Claims

1. In a reproduction machine having a plurality of interactive machine components cooperable to produce copies from document originals including a control having a touch operative user interface and screen display, a self contained method of problem analysis comprising the steps of:
entering into a problem analysis mode in the machine,
providing a portion of the display to manifest a fault code if a machine fault actually exists,
displaying a first plurality of system indicators related to suspected machine problems,
touch entering into the control via the user interface a fault

code number, if a fault code is manifested in said portion of the display, or

touch activating one of the, system indicators and

displaying a second plurality of system indicators related to said one of the systems indicators the second plurality of system indicators providing visual representations to identify said suspected machine problem.

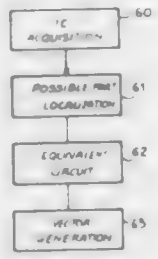
DEVICE AND METHOD FOR THE GENERATION OF TEST VECTORS AND TESTING METHOD FOR INTEGRATED CIRCUITS



Bernard Dias, and Arnaud du Chene, both of Paris, France, assignors to Thomson-CSF, Paris, France

Filed Oct. 8, 1987, Ser. No. 107,502

Claims priority, application France, Oct. 10, 1986, 86 14148

Int. Cl.[5] G01R *31/28;* G06F *11/22*

U.S. Cl. 371—27 7 Claims

1. A method of testing each of a series of integrated logic circuits comprising (FIG. 54)

the steps of

analyzing (60) each type of integrated circuit and determining (61) possible logic faults therein including logic faults caused by the physical structure and relative position of the circuit elements in the integrated logic circuit and how each such logic fault would affect outputs expected to be triggered from said integrated logic circuit by a particular pattern of inputs,

generating (63) and applying to inputs of each circuit at least one test vector per possible logic fault so that said vector applied to said logic circuit will trigger at least one actual output pattern which will reveal the existence of any such logic fault;

comparing the actual pattern of outputs from said integrated logic circuit with said expected outputs, and

indicating, for each integrated logic circuit tested, whether said actual and expected output patterns match,

wherein the fault-determining step comprises

the step of determining (62) cells logically equivalent to actual parts of the integrated circuit.

5,010,553

HIGH SPEED, ERROR-FREE DATA TRANSMISSION SYSTEM AND METHOD

Clifford D. Scheller, Bartlett; Aaron A. Collins, Arlington Heights, and Joseph M. Hansen, Roselle, all of Ill., assignors to Compuquest, Inc., Schaumburg, Ill.

Filed Dec. 5, 1988, Ser. No. 279,914

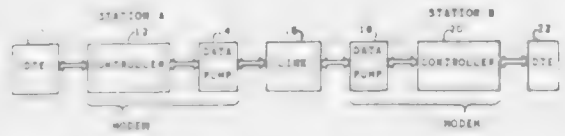
Int. Cl.[5] G08C *25/00*

U.S. Cl. 371—35 17 Claims

1. A method of transmitting data from a transmitter to a receiver with improved throughput comprising the steps of:

formulating data into identifiable packets;

sequentially transmitting said packets to a receiver;



checking for errors in received packets;

loading error-free packets in sequence onto a packet carousel having a fixed number of packet positions;

removing error-free packets in sequence from said carousel;

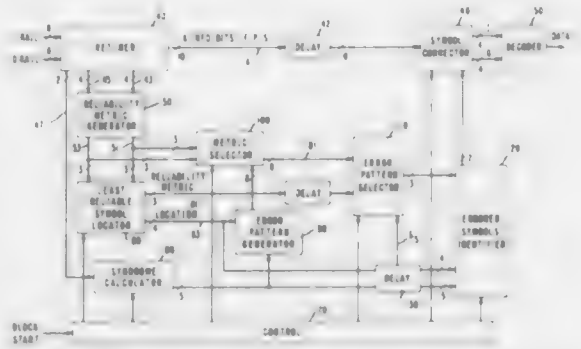
signaling the identity of a defective packet to said transmitter in a header identifying the number of the packet, the number of total bytes and the number of data bytes in the packet, and error detection information,

maintaining an empty position on said packet carousel for a packet found to be defective;

retaining error-free data packets in positions subsequent to said empty position on said carousel; and

retransmitting said identified packet by interspersing it in the normal sequence of transmitted packets.

5,010,554



ERROR CORRECTION METHOD AND APPARATUS

Linda K. Bechtel, Newburyport, and Gary D. Martin, North Andover, both of Mass., assignors to AT&T Bell Laboratories, Murray Hill, N.J.

Filed May 12, 1989, Ser. No. 350,494

Int. Cl.[5] G06F *11/10;* H03M *13/00*

U.S. Cl. 371—37.1 Claims

1. Apparatus for correcting block coded data received in the form of discrete symbols that may incorporate one or more errors comprising:

analog-to-digital converting means (20) for converting said received symbols into hard bits corresponding to the received data and soft bits indicative of the proximity of said received symbol values to valid symbol values;

syndrome calculating means (60) responsive to said hard bits for calculating the syndrome of each received coded block,

reliability metric generating means (50) responsive to said soft bits for generating a reliability metric for each received symbol;

error pattern candidate retrieving means (90) responsive to said syndrome for identifying a plurality of error pattern candidates, each such candidate comprising one or more symbols for correction to produce a valid symbol block, and

error correcting means (100, 110, 120, 140) responsive to said error pattern candidates and said reliability metrics for correcting the symbols of one of said identified error pattern candidates to produce the valid symbol block closest to the received symbol values characterized in that;

said data is encoded according to a block code having an over-all parity bit;

said apparatus further comprises:

least reliable symbol identifying means (80) responsive to said reliability metrics for identifying the symbol in each coded block that is closest to a slicing level;

in response to a non-zero even syndrome, said error pattern candidate retrieving means identifies the complete set of two-symbol errors that can produce the said even syndrome; and

in response to an odd syndrome said error pattern candidate retrieving means identifies the one single-symbol error and the complete set of three-symbol errors, each including said least reliable symbol, that can produce the said odd syndrome.

NON-LINEAR INTRACTIVITY OPTICAL DEVICES FOR FREE ELECTRON LASERS

John M. J. Madey, 2120 Amherst St., Palo Alto, Calif. 94306; Stephen V. Benson, 624 Leksich Ave., Mountain View, Calif. 94041; John F. Schultz, 3834 Nimitz St., Eau Claire, Wis. 54701, and Antonello Cutolo, Via Claudio 21, Naples, Italy 80125

Continuation of Ser. No. 338,527, Apr. 14, 1989, abandoned, which is a continuation of Ser. No. 258,081, Oct. 13, 1988, abandoned, which is a continuation of Ser. No. 186,781, Apr. 25, 1988, abandoned, which is a continuation of Ser. No. 921,923, Oct. 22, 1986, abandoned. This application Jul. 25, 1990, Ser. No. 560,461

Int. Cl.[5] H01S *3/00*

U.S. Cl. 372—2 12 Claims

1. An improved free-electron laser (FEL) oscillator comprising:

an electron accelerator system which injects a beam of relativistic electrons along an axis;

undulator means for generating a periodic transverse motion of said beam about said axis;

a set of mirrors disposed about said axis defining a resonant optical cavity along said axis, said cavity having an optical length that defines a round-trip cavity transit time; and

a transmissive non-linear optical means mounted on said axis for producing a phase-matched interaction between the optical wave supported by said resonator and a field in the group consisting of an externally applied acoustic field, an externally applied electric field, and the optical wave itself, thereby modulating the amplitude polarization, or wave vector of the optical wave.

A STRIPE-SHAPED HETEROJUNCTION LASER WITH UNIQUE CURRENT CONFINEMENT

Koichi Imanaka, Kyoto, and Hiroshi Imamoto, Takatsuki, both of Japan, assignors to Omron Tateisi Electronics Co., Kyoto, Japan

Division of Ser. No. 48,616, May 11, 1987, Pat. No. 4,839,307. This application Jan. 13, 1989, Ser. No. 297,025

Claims priority, application Japan, May 14, 1986, 61-108652; Mar. 10, 1987, 62-52964

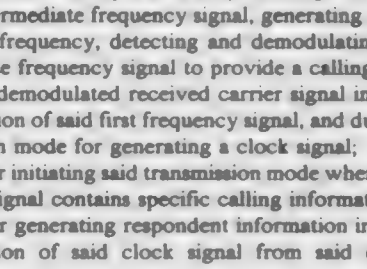
Int. Cl.[5] H01S *3/19;* H01L *33/00*

U.S. Cl. 372—46 14 Claims

1. A semiconductor laser having internal current restriction, comprising:

an n-side electrode and a p-side electrode;

a resonant cavity;



a (100) face-oriented p-type GaAs substrate having a difference in level exposing an (n11) (n=1-5) A face;

an Si-doped $Al_zGa_{1-z}As$ current restriction layer formed on said substrate;

a p-type $Al_yGa_{1-y}As$ cladding layer formed on said current restriction layer;

an active layer formed on said p-type cladding layer;

an n-type $Al_xGa_{1-x}As$ cladding layer having Sn as a dopant formed on said active layer; and

an n^+-GaAs contact layer formed on said n-type cladding layer.

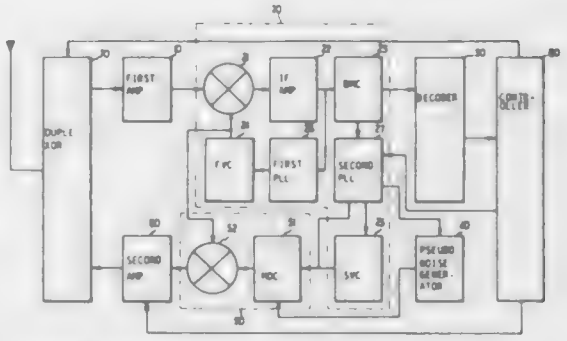
MOBILE RADIO TRANSMITTER USING BAND EXPANDING METHOD



Soon-Ik Chun, Kwachun, Rep. of Korea, assignor to SamSung Electronics Co., Ltd., Suwon, Rep. of Korea

Filed Oct. 13, 1989, Ser. No. 421,057

Claims priority, application Rep. of Korea, Oct. 13, 1988, 1988-13356

Int. Cl.[5] H04K *1/04*

U.S. Cl. 375—1 15 Claims

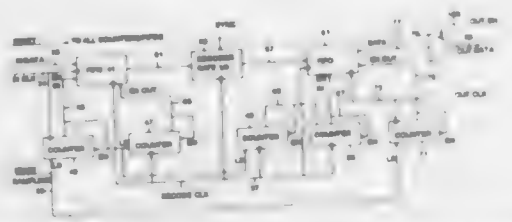
7. A transceiver, comprising:

means for converting a first frequency signal received into an intermediate frequency signal, generating a local oscillation frequency, detecting and demodulating said intermediate frequency signal to provide a calling code signal and a demodulated received carrier signal in response to reception of said first frequency signal, and during a transmission mode for generating a clock signal;

means for initiating said transmission mode when said calling code signal contains specific calling information;

means for generating respondent information in response to reception of said clock signal from said demodulator means;

modulator means for receiving the local oscillation frequency, the demodulated received carrier signal and the respondent information, executing a first modulation of said respondent information by use of the demodulated received carrier to produce a first modulated signal, and then mixing the first modulated signal with said local oscillation frequency to produce a second modulated signal; and



duplexor means for transmitting the second modulated signal from said second amplifier during said transmission mode, and for applying said first frequency signal to said converting means in the absence off said transmission mode.

DATA OVERLAP DECODER

Richard A. Yost, West Melbourne, and David H. Damerow, Palm Bay, both of Fla., assignors to Harris Corporation, Melbourne, Fla.

Filed Sep. 29, 1988, Ser. No. 250,697
Int. Cl.[5] H04L *27/00*; H04B *1/10*
U.S. Cl. 375—37 **10 Claims**

1. For use with a communication system having a transmitter site whereat information signals are encoded at a first encoding rate and transmitted over a communication channel to a receiver site whereat encoded information signals that have been transmitted over said communication channel from said transmitter site are received, an apparatus for recovering said signals comprising:

a plurality of first means, each of which is coupled to receive said encoded information signals, for extracting, at a rate less than said encoding rate, a respective portion of said received encoded information signals that overlaps another portion of said information signals the time of occurrence of which is different from the time of occurrence of said respective portion; and

second means for combining extracted portions of the received encoded information signals decoded by said plurality of second means and thereby producing output signals corresponding to said information signals; and wherein

each first means includes first memory means for storing a respective sequential overlapping portion of said received encoded information signals, and decoding means, coupled to said first memory means, for decoding signals stored therein at a rate lower than said first rate at which said information signals are encoded at said transmitter site and producing therefrom a portion of said information signals; and wherein

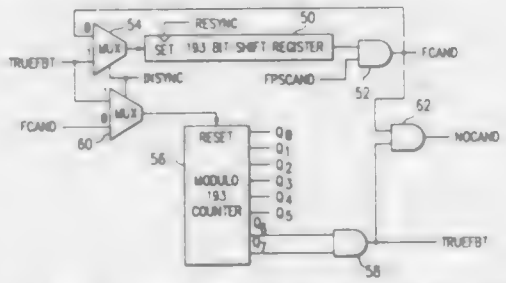
each of said first means includes means for writing said respective overlapping portion of said received encoded information signals into said first memory means at a rate corresponding to the data rate of said received signals, and for coupling the contents of said first memory means to said decoding means at a clock rate corresponding to said lower rate.

5,010,559

SYSTEM FOR SYNCHRONIZING DATA FRAMES IN A SERIAL BIT STREAM

James T. O'Connor, Dallas, and David A. Courtright, Carrollton, both of Tex., assignors to SGS-Thomson Microelectronics, Inc., Carrollton, Tex.

Filed Jun. 30, 1989, Ser. No. 374,277
Int. Cl.[5] H04J *3/06*
U.S. Cl. 375—116 **14 Claims**



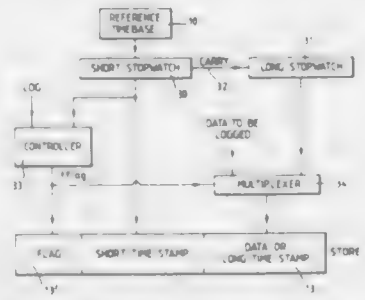
1. A system for determining frame alignment within a serial data stream, each frame having a frame bit, comprising:

a shift register having N bit locations, said register initially having all N bits set to a first logic state;

first logic means for generating a candidate signal when selected bits from the data stream match a preselected pattern;

second logic means for shifting the first logic state into said shift register if a current shift register output is in the first logic state and said first logic means is generating a candidate signal, and for shifting a second logic state into said shift register otherwise; and

a modulo N counter, wherein said counter is incremented each time said second logic means shifts the second logic



state into said shift register, and wherein said counter generates a signal identifying a frame bit position when it counts to (N − 1), and wherein said counter is reset when the first logic state is shifted into said register by said second logic means.

5,010,560

DATA LOGGING APPARATUS

Mark A. Janney, Temple; Roger Newey, Scottsdale, and Irwin J. Robinson, III, Mesa, all of Ariz., assignors to Marconi Instruments, Inc., Scottsdale, Ariz.

Filed Jan. 17, 1989, Ser. No. 297,690
Int. Cl.[5] G04F *10/00*
U.S. Cl. 377—20 **5 Claims**

1. Apparatus for real-time stamping data in data logging applications, the apparatus comprising:

a) a reference time base;

b) short stopwatch means for generating from the reference time base a short-time stamp;

c) means for combining data to be logged with said short-time stamp;

d) means for storing the data and the short-time stamp;

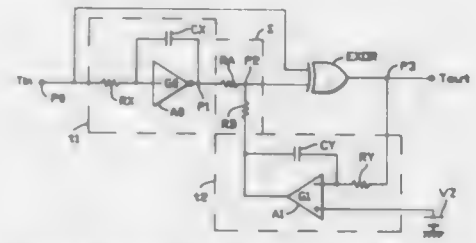
e) a long stopwatch means connected to said short stopwatch means for generating at intervals a long-time stamp; and

f) a controller circuit for controlling the storage of the data and of the long-time and short-time stamps, the controller circuit being operative to store said long-time stamp at predetermined intervals.

5,010,561

CIRCUIT FOR MULTIPLYING THE FREQUENCY IN ONE SERIES OF INPUT PULSES

Tatsuo Itoh, Higashikurume, Japan, assignor to Advanced Micro Devices, Inc., Sunnyvale, Calif.



Filed May 22, 1989, Ser. No. 355,694
Claims priority, application Japan, May 23, 1988, 63-126899
Int. Cl.[5] H03B *5/20, 19/00*; H03K *4/06*
U.S. Cl. 377—47 **1 Claim**

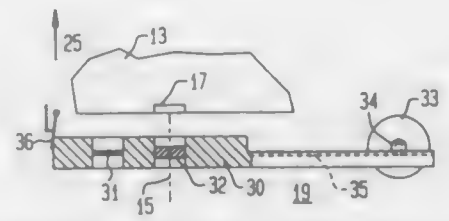
1. A circuit which multiplies the frequency in a series of input pulses with a given frequency and a duty cycle essentially of 50% comprising:

a circuit which includes a means to generate a ramp signal in which the ramp portion is formed as a function of the repetition of the input pulse by responding to the input pulses,

an exclusive-OR logic to evaluate the exclusive-OR logic of said input pulses and the output from said ramp signal generating means.

a feedback means which couples the output of said exclu-

sive-OR logic to the input of said exclusive-OR logic for integrating the output of said exclusive-OR logic including adding means for adding said integrated feedback signal with said ramp signal from said ramp signal generating means, said added signals coupled to the input of said exclusive-OR logic, and



a threshold voltage adjusting means coupled to said integrating and feedback means for providing a multiplied frequency having a 50% duty cycle at the output of said exclusive-OR logic by determining the direct current level of the integrating and feedback signal.

5,010,562

APPARATUS AND METHOD FOR INHIBITING THE GENERATION OF EXCESSIVE RADIATION

Francisco Hernandez, Concord, and Jerry Chamberlain, Pittsburg, both of Calif., assignors to Siemens Medical Laboratories, Inc., Walnut Creek, Calif.

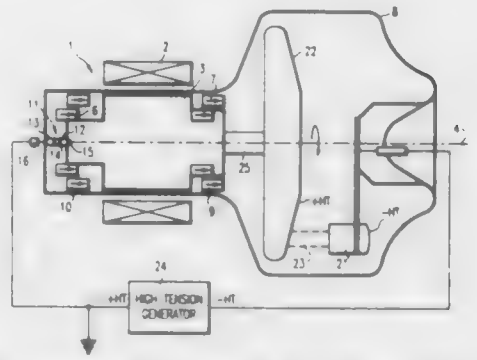
Filed Aug. 31, 1989, Ser. No. 401,355
Int. Cl.[5] A61N *5/10*
U.S. Cl. 378—125 **19 Claims**

1. An apparatus for generating electron radiation or X-ray radiation, said apparatus comprising:

accelerator means for generating and accelerating electrons to form an electron beam which has a predetermined low intensity level for the generation of said electron radiation or a predetermined high intensity level for the generation of said X-ray radiation;

supporting means for supporting a scattering foil and a target and for selectively moving either said foil into the trajectory of said electron beam having said low intensity level for generating said electron radiation upon impingement of said electrons there or on said target into the trajectory of said electron beam having said high intensity level for generating said X-ray radiation upon impingement of said electrons thereon;

detecting means operable by said supporting means for sensing the position of said target relative to the trajectory of said electron beam; and



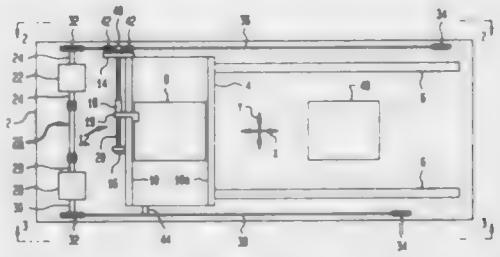
inhibiting means coupled to said accelerator means and to said detecting means for preventing the generation of an electron beam having said high intensity level if said foil and not said target is positioned in the trajectory of said electron beam.

5,010,563

SYSTEM FOR THE SUSPENSION OF A ROTATING ANODE OF AN X-RAY TUBE WITH PASSIVE MAGNETIC BEARINGS

Michel Laurent, Plaisir; Marc Doukhan, Noisy Le Roi, and Pierre Nouailhaguet, Issy les Moulineaux, all of France, assignors to General Electric CGR S.A., Issy les Moulineaux, France

Filed Sep. 12, 1989, Ser. No. 406,254
Claims priority, application France, Sep. 23, 1988, 88 12483
Int. Cl.[5] H01J *35/10*
U.S. Cl. 378—132 **8 Claims**



1. A system for the suspension of a rotating anode of an X-ray tube which has a rotor rotating on an axis, one end of which supports the anode and a stator placed at the outside of said tube, wherein said system comprises at least two first magnetized rings fixed to the rotor, and at least two other magnetized rings fixed a casing of said tube, said rings being positioned with respect to one another so that said rotor can rotate without mechanical friction around an axis of rotation and so that it is axially shifted so as to come into contact with a thrust-bearing placed on a side opposite that of the anode.

5,010,564

DUAL AXIS TRANSLATION MECHANISM

Howard C. Thomas, Westminster, Colo., assignor to Eureka X-Ray Tube, Inc., Chicago, Ill.

Filed Sep. 14, 1989, Ser. No. 406,991
Int. Cl.[5] G03B *42/04*
U.S. Cl. 378—176 **25 Claims**

1. A mechanism for selective translation of an object along first and second axes, comprising:

a frame;

a carriage mounted on said frame so as to allow movement of said carriage with respect to said frame along a first axis;

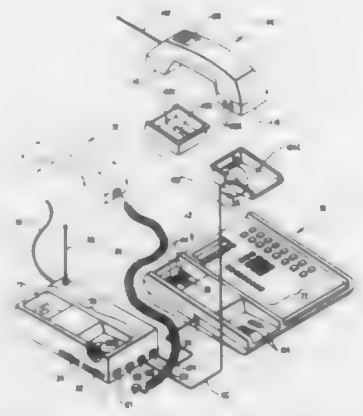
a holder for said object;

intermediate mounting means coupled with said holder and said carriage for mounting said holder on said carriage so

as to allow movement of said holder with respect to said carriage along a second axis which is different from said first axis;

a motor for selectively driving a first shaft;

a drive/brake assembly for providing a second shaft which, in a drive mode of said assembly is driven synchronously with said first shaft and, which in a brake mode of said assembly is held non-driven while said first shaft is being driven; and



first and second endless belts mounted for rotating movement within said frame and extending in a direction parallel to said first axis, said first and second belts being coupled to said first and second shafts, respectively, for receiving selective rotational movement therefrom, with said first belt also being coupled to said intermediate mounting means for causing selective movement of said object holder in a direction parallel to said second axis during said brake mode of said drive/brake assembly and said second belt being coupled with said carriage for causing selective movement of said carriage in a direction parallel to said first axis and no movement of said object holder in a direction parallel to said second axis during said drive mode of said drive/brake assembly.

APPARATUS AND METHOD FOR ADDING CORDLESS HANDSET CAPABILITY TO AN EXISTING CORDED TELEPHONE

Bryan Nash, 2561 E. 3370 South, Salt Lake City, Utah 84109, and Trenton D. Stoddard, 5872 Fontaine Bleu Dr., Salt Lake City, Utah 84121

Filed Jun. 29, 1990, Ser. No. 546,567
Int. Cl.[5] H04M *11/00*
U.S. Cl. 379—61 48 Claims

37. A system for adding cordless capability to an existing corded telephone, the existing corded telephone having an original corded base with a handset cradle, a handset jack, and a corded handset with a cord, the system comprising:

a cordless handset comprising a wireless transmitter and a wireless receiver;

at least one battery charging connector located on the cordless handset;

first charging cradle means fitting onto said original handset cradle for receiving a telephone handset, the charging cradle means being free standing from the existing corded telephone;

first charging contact means, positioned in the first charging cradle means, for conveying a charging current to the battery charging connector on the cordless handset when the cordless handset is resting in the first charging cradle means;

first hook switch means at said corded base for actuating said corded telephone when said corded handset is carried by said first charging cradle means;

a cordless base;

a wireless transmitter located in the cordless base;

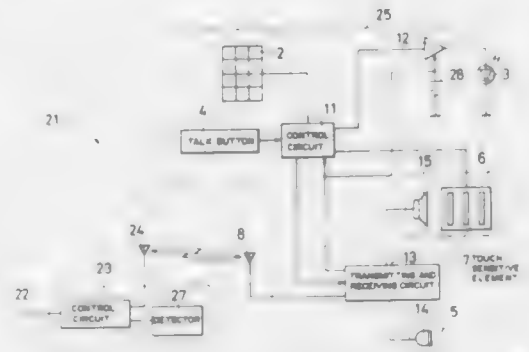
a wireless receiver located in the cordless base;

a charging circuit means located in the cordless base;

first interconnection means for electrically connecting the handset jack of the corded base to the cordless base so that information can be conveyed therebetween such that duplex communications can be established between the existing corded telephone and the cordless handset;

second charging cradle means formed at said cordless base for receiving a handset;

second charging contact means positioned in said second charging cradle means for conveying a charging current to the battery charging connector on the cordless handset when the cordless handset is resting in the second charging cradle means; and



second hook switch means at said cordless base for actuating said corded telephone when said corded handset is carried by said second charging cradle means.

5,010,566

CORDLESS TELEPHONE

Masayoshi Seo, Higashi-Hiroshima, Japan, assignor to Sharp Kabushiki Kaisha, Osaka, Japan

Filed Sep. 7, 1989, Ser. No. 403,887
Claims priority, application Japan, Sep. 8, 1988, 63-225347
Int. Cl.[5] H04M *11/00*
U.S. Cl. 379—61 18 Claims

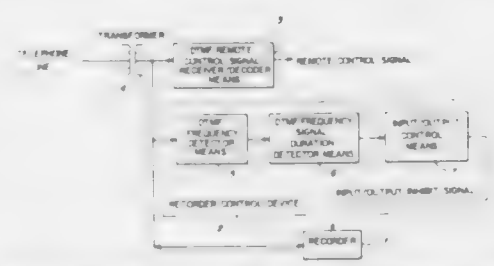
1. A cordless telephone apparatus including a base unit connected to a telephone line for communication, and a handset, operatively connected to the base unit by radio waves, including a speaker, a microphone, a transmitting and receiving circuit for communicating with the base unit by radio waves, transforming the signals from a caller into acoustic sound by the speaker, and second the output from the microphone to the caller, and a battery for providing the transmitting and receiving circuit with electric power, the handset further comprising:

display means for indicating an in-service state of the cordless telephone activated for communication;

contact detecting means for detecting contact of a user with an area proximate to the speaker;

activation detecting means for detecting activation of the cordless telephone for communications to detect the in service state; and

control means operatively connected to the display means, the contact detecting means and the activation detecting means, for controlling the display means to stop indicating an in-service state when an area proximate to the speaker is detected to be in contact with a user and an in service state is detected, in response to the contact detecting means and activation detecting means, and for controlling the display means to indicate an in-service state when an area proximate to the speaker is not detected to be in contact with a user and an in service state is detected; and



the handset battery means for electrically powering the handset.

5,010,567

RECORDER CONTROL APPARATUS FOR AUTOMATIC TELEPHONE ANSWERING SYSTEM

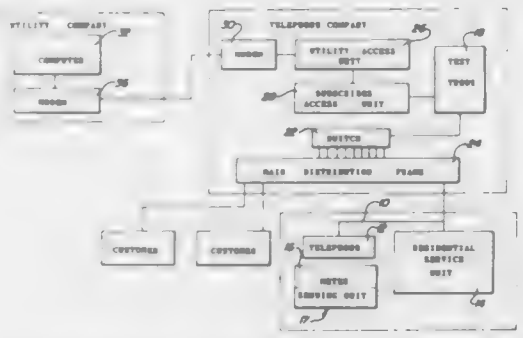
Masayuki Tsushima, Chofu, Japan, assignor to Tandy Electronics Japan Ltd., Tokyo, Japan

Filed Aug. 5, 1988, Ser. No. 229,126
Int. Cl.[5] H04M *1/65*
U.S. Cl. 379—77 17 Claims

14. In an automatic telephone answering system including a recorder having an input and an output connected to a telephone line for the recording and playing of messages and which is remotely controllable through the use of a dual-tone signal, a method for controlling the recorder comprising the steps of:

detecting the dual-tone signal, with a minimum time Td for such detection;

inhibiting the recorder when the dual-tone signal having dual-tone frequencies continues for a predetermined maximum allowable time, T max, which is less than said minimum time Td;



thereby preventing the signal having the dual-tone frequencies from being input to or output from the recorder over a period of time longer than the minimum time Td.

REMOTE METER READING METHOD AND APPARATUS

David P. Merriam; Dale L. Scott, both of Albuquerque, and Bryan F. Scott, Rio Rancho, all of N. Mex., assignors to Sparton Corporation, Jackson, Mich.

Filed Apr. 4, 1989, Ser. No. 333,117
Int. Cl.[5] H04M *11/00*
U.S. Cl. 379—107 9 Claims

1. In an automatic meter reading system of the type which utilizes a telephone system having a central office, multiple subscriber lines each having a subscriber telephone connected therewith at a subscriber station, said subscriber lines being coupled to a switch in the central office for selective connection of any one of the subscriber lines to another line, voltage supply means for supplying electrical power from the central office to the subscriber lines, a test trunk for selectively accessing said subscriber lines without ringing the telephone of the selected line, a subscriber line access means coupled with the test trunk for accessing a selected line, a transponder at the subscriber station coupled with said subscriber line and with one or more utility meters, and control signal means coupled with the subscriber access means for generating a control signal for a transponder at a selected subscriber station, the improvement wherein said transponder comprises:

detecting means for detecting a control signal on the telephone line,

a microprocessor including a read/write memory,

a meter pulse generating means coupled with said meter for producing an electrical meter pulse corresponding to a predetermined meter event,

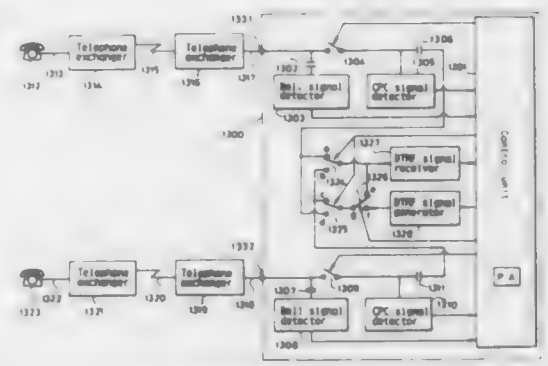
first coupling means for coupling the meter pulse generating means to the microprocessor,

means for switching the microprocessor from a quiescent mode to an active mode in response to a meter pulse,

the microprocessor being programmed to count pulses from said meter pulse generating means and for storing the pulse count in said read/write memory, and for switching the microprocessor to the quiescent mode after the pulse count is stored,

a DTMF tone generator coupled with the microprocessor,

second coupling means for coupling said detecting means to said microprocessor,



and means for switching the microprocessor from a quiescent mode to an active mode in response to a control signal, said microprocessor being programmed to produce a tone generator signal for said tone generator in response to a predetermined control signal for producing a sequence of tone pairs representing said pulse count stored in the read/write memory and for switching the microprocessor to the quiescent mode after the sequence of tone pairs is produced.

5,010,569

TELEPHONE-CALL DISTRIBUTOR

Hiromi Katagawa, Fukuoka, Japan, assignor to Matsushita Electric Industrial Co., Ltd., Kadoma, Japan

Filed Aug. 2, 1989, Ser. No. 388,446
Claims priority, application Japan, Aug. 3, 1988, 63-194074; Aug. 3, 1988, 63-194075; Aug. 3, 1988, 63-194076
Int. Cl.[5] H04M *9/00*
U.S. Cl. 379—210 12 Claims

1. A telephone-call distributor comprising:

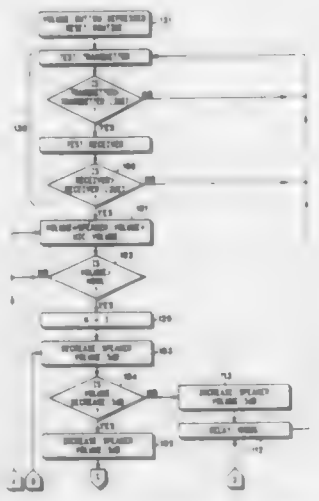
signal receiving means for receiving a first DTMF signal coming from a first telephone line and outputting a dial data signal;

control means for receiving said dial data signal from said signal receiving means;

signal generating means, responsive to said control means, for generating a second DTMF signal having a same code as said dial data signal;

forwarding means for forwarding said second DTMF signal generated by said signal generating means to a second telephone line; and

connecting means, responsive to said control means, for connecting said first telephone line with said second telephone line to thereby make a speaking circuit therebetween, said first telephone line being connected to a first



telephone set and said second telephone line being connected to a second telephone set.

5,010,570

METHOD FOR ACTIVE FEEDBACK SUPPRESSION

Daniel E. Kobylarz, Burnsville, Minn., and David K. Ford, Mesa, Ariz., assignors to Motorola, Inc., Schaumburg, Ill.

Filed Feb. 20, 1990, Ser. No. 481,531
Int. Cl.[5] H04M 9/08
U.S. Cl. 379—390 13 Claims

7. A method for actively suppressing feedback in a communications device having a system loop gain stored in memory, a received audio signal, a transmitted audio signal, and a user volume substantially equal to a speaker volume plus a microphone volume, the steps comprising:

(A) comparing the transmitted audio signal to a first predetermined limit;

(B) comparing the received audio signal to a second predetermined limit if the transmitted audio signal is less than the first predetermined limit;

(C) repeating from step A if the received audio signal is less than the second predetermined limit;

(D) decreasing the speaker volume by a first predetermined amount if the user volume is greater than the system loop gain;

(E) delaying for a predetermined time and repeating from step A if the microphone volume does not decrease by the first predetermined amount, increasing the speaker volume by the first predetermined amount;

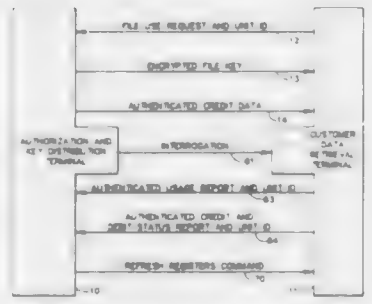
(F) increasing the speaker volume by the first predetermined amount;

(G) delaying for the predetermined time and repeating from step A if the microphone volume does not increase by the first predetermined amount;

(H) repeating steps D–G a predetermined number of times;

(I) decreasing the microphone volume and the speaker volume by a second predetermined amount until the user volume is less than the system loop gain stored in memory and greater than or equal to a mid-range of the speaker volume;

(J) increasing the microphone volume and the speaker volume by the second predetermined amount until the user volume within a range bounded by the system loop gain as a lower limit and nominal volume as an upper limit; and



(K) repeating from step A.

5,010,571

METERING RETRIEVAL OF ENCRYPTED DATA STORED IN CUSTOMER DATA RETRIEVAL TERMINAL

Ron D. Katznelson, San Diego, Calif., assignor to Titan Linkabit Corporation and Cable/Home Communication Corporation, both of San Diego, Calif.

Filed Sep. 10, 1986, Ser. No. 905,775
Int. Cl.[5] H04L 9/00
U.S. Cl. 380—4 43 Claims

1. A method of controlling and accounting for retrieval of data from a memory, comprising the steps of

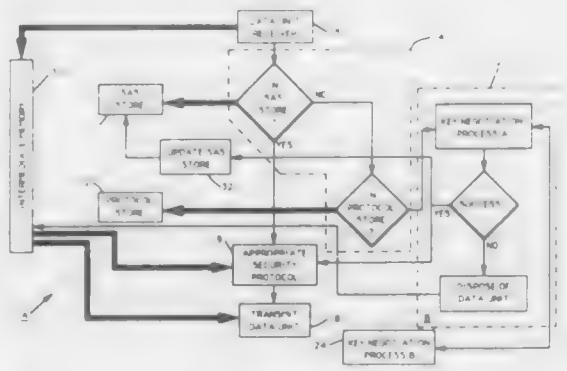
(a) providing a memory containing an encrypted data file from which retrieval must be authorized;

(b) authorizing said retrieval by providing an encryption key for enabling retrieval of said data and a credit signal for use in limiting the amount of data to be retrieved from said file;

(c) limiting the amount of data retrieved from said file in accordance with said credit signal;

(d) recording the amount of data retrieved from said file;

(e) reporting the recorded amount of data retrieved from said file; and



(f) authenticating said report.

5,010,572

DISTRIBUTED INFORMATION SYSTEM HAVING AUTOMATIC INVOCATION OF KEY MANAGEMENT NEGOTIATIONS PROTOCOL AND METHOD

Erwin W. Bathrick, La Habra, and James E. Zmuda, El Toro, both of Calif., assignors to Hughes Aircraft Company, Los Angeles, Calif.

Filed Apr. 27, 1990, Ser. No. 515,819
Int. Cl.[5] H04I 9/02
U.S. Cl. 380—21 4 Claims

1. In a distributed information system which includes a plurality of end-systems each of which includes data unit transmitting and receiving means having a security protocol and a corresponding security protocol key from one end-system to another end-system, the improvement comprising:

secure address storage means for storing a set of end-system addresses and corresponding end-system security protocol keys;

protocol address storage means for storing a set of end-system addresses requiring security protocol data transfers;

data unit receiver means for receiving a data unit and for generating a data unit transfer request signal which includes an end-system address and data unit security protocol;

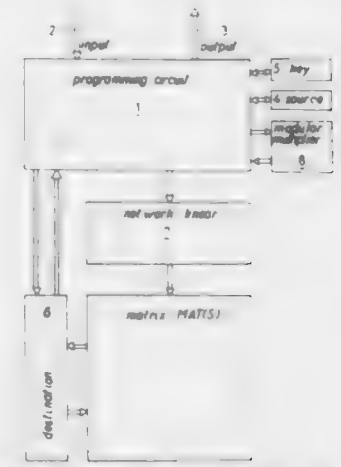
intermediate storage means for storing a received data unit in response of a data transfer request signal and outputting the stored data unit to the end-system transmitting and receiving means in response to a transfer enable signal;

automatic key management processor means responsive to the data unit transfer request signal for comparing the received data unit security key and end-system address to the set of end system address and security protocol keys, and for generating the transfer enable signal in response to a match therebetween, and in the absence of a match therebetween, comparing the received data unit address to the end-system addresses from the protocol address storage means and generating a security key protocol request signal in response to a match therebetween, and for generating the transfer enable signal in response to the absence of a match between the data unit address and an address in the set of addresses stored in the protocol address storage means;

security key negotiating means responsive to the security key protocol request signal for negotiating a security key with another end-system and for generating a security key negotiation confirm signal upon completion of a negotiation;

means responsive to the security key negotiation confirm signal for storing the security key for the another end-system in the one system secure address store storage means;

and wherein each end-system is responsive to the security key negotiation confirm signal and is adapted to generate the transfer enable signal, and wherein the end-system data unit transmitting and receiving means are responsive to the transfer enable signal and are adapted to transfer the data unit corresponding to the security protocol of the received data unit, and wherein the security key negotiation comprises a fully encrypted negotiation exchange.



5,010,573

CRYPTOGRAPHIC SYSTEM BY BLOCS OF BINERY DATA

Emile P. Musyck, Amerikalaan 28, 2440 Geel, and Christian E. Musyck, Rue de Boulez 26, 5980 Grez Doiceau, both of Belgium

Filed Apr. 27, 1990, Ser. No. 515,236
Claims priority, application Belgium, Apr. 28, 1989, 8900467
Int. Cl.[5] H04L 9/06
U.S. Cl. 380—28 13 Claims

1. A cryptographic system for converting a vector of data of n bits to a ciphered vector of n bits under the control of a cryptographic key that is formed by a vector of n bits, too, with n being a whole number comprising means that allows, using a DLM (discrete Logarithnm Multiplier) algorithnm, for calculating from an input vector Es referred to a source vector and that corresponds to the data to be ciphered, an output vector Ed that corresponds to the ciphered text which is equal to the state of a linear shift register that corresponds to a register composed of n elements and of one negative feedback loop, at least, with the latter being formed by or-exclusive circuits, the inlets and outlets of which are linked to the outlets and inlets of the elements of the shift register so as to obtain for this shift register the maximum possible length of $2\exp(n)-1$ for the sequence of the consecutive states, referred to as linear sequence, with each state of this register representing a jump, the origin of which is a reference vector referred to as "zero-origin", and with the value of the jump being the sequence number of this state in the linear sequence, with these means also being so designed that each jump may be expressed in the form of a linear relation REL as a function of the n first states of the linear sequence as from the "zero-origin" state, with the n states allowing for grouping in the form of n columns in view of achieving a square matrix referred to as MAT(O), with this matrix containing implicitly all the elements that characterize the shift register, with the aforesaid relation REL constituting an invariant for a jump that comprises an equal number of consecutive states of the linear sequence between the origin and the destination of the jump, with the origin of the jump corresponding to the first vector of a set of n consecutive states of the linear sequence grouped in columns in order to obtain a square matrix MAT(S), with the matrix product of this matrix by the vector REL giving the destination of the jump, with the

algorithm DLM allowing for searching for the aforesaid output vector while using this linear relation, the vector which corresponds to the state of the linear sequence being defined by a jump counted from the reference vector "zero-origin" equal to k times the modulo $(2\exp(n)-1)$ jump that characterizes the source vector, with the jump corresponding to the output vector of the algorithm DLM being obtained through a succession of jumps put end to end and commencing at this reference vector, with these jumps being of two types, the first type being equal to the jump from the reference vector to the source vector and a second type being equal to the jump from the reference vector to the destination of the jump made last.

5,010,574

VECTOR QUANTIZER SEARCH ARRANGEMENT

Robert C. Wang, Meadham Township, Morris County, N.J., assignor to AT&T Bell Laboratories, Murray Hill, N.J.

Filed Jun. 13, 1989, Ser. No. 365,642
Int. Cl.[5] G10L 5/00
U.S. Cl. 381—42 23 Claims

1. A method for coding a multi-element signal comprising the steps of:

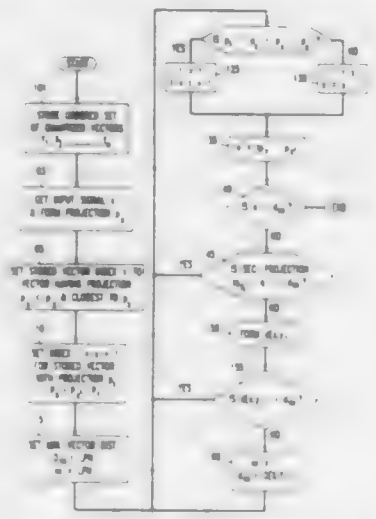
storing a plurality of multi-element reference signals $y_1, y_2, \ldots, y_N$ in a codebook storage array representable in a prescribed vector space;

receiving a multi-element input signal x representable in the prescribed vector space; and

selecting one of the stored reference signals y_m to represent the multi-element input signal;

the selecting step including:

selecting a predetermined orientation of a reference line for projection mapping in the prescribed vector space,



forming a set of signals each representative of the projection p_{yn} of the reference signal y_n on the reference line with the predetermined orientation in the prescribed vector space,

forming a signal representative of the projection p_x of the input signal on the reference line with the predetermined orientation in the prescribed vector space,

choosing one or more of the stored reference signals y_i

responsive to their projections p_{yi} on the reference line with the predetermined orientation,

generating for each chosen reference signal y_i, a signal representative of the difference between the reference signal projection and the input signal projection on the reference

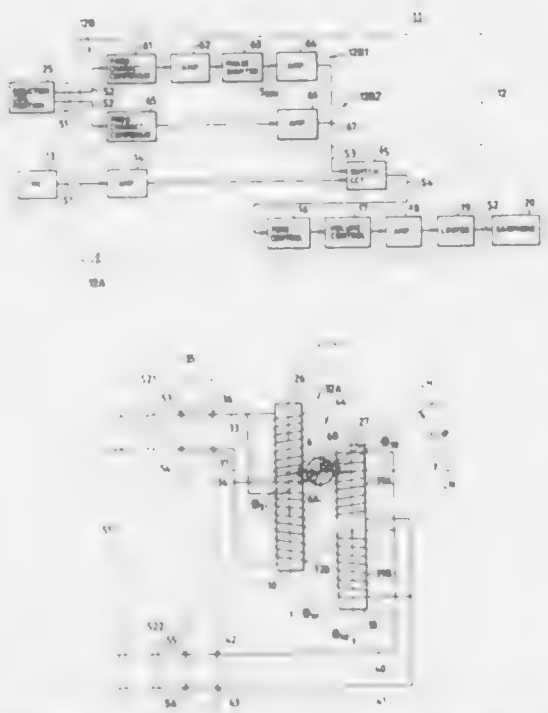
line with the predetermined orientation $|p_{yi}-p_x|$ responsive to the reference signal projection p_x, and input signal projection p_x, and

determining the reference signal y_m that most closely matches the input signal responsive to the projection difference signals.

5,010,575

AUDIO CURRENT PICK-UP DEVICE

Yozo Marutake; Tatsuro Fukutome, and Motomu Asami, all of Tokyo, Japan, assignors to Rion Kabushiki Kaisha, Tokyo, Japan



Filed May 17, 1989, Ser. No. 353,839

Claims priority, application Japan, May 30, 1988, 63-134085

Int. Cl.[5] H04R *25/00*; H04M *1/100*

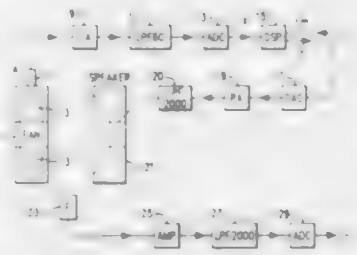
U.S. Cl. 381—68 3 Claims

1. An audio current pick-up device comprising a first magnetic induction coil means including at least one induction coil, a second magnetic induction coil means including at least one induction coil, said first and said second magnetic induction coil means being arranged in parallel to each other with an axial positional deviation of said induction coil of said first magnetic induction coil means with respect to that of said second magnetic induction coil means by a predetermined amount, and circuit means for combining output signals of said first and said second magnetic induction coil means to form a sound output signal, wherein said first and said second magnetic induction coil means include magnetic rod cores, respectively, and wherein a pair of coils are wound in opposite directions on respective halves of each of said magnetic rod cores,

said pair of coils being connected in parallel to each other, and said output signals being derived from said coil pairs

---

5,010,576



ACTIVE ACOUSTIC ATTENUATION SYSTEM FOR REDUCING TONAL NOISE IN ROTATING EQUIPMENT

Peter D. Hill, Monroeville, Pa., assignor to Westinghouse Electric Corp., Pittsburgh, Pa.

Filed Jan. 22, 1990, Ser. No. 468,329

Int. Cl.[5] G10K *11/16*

U.S. Cl. 381—71 24 Claims

15. An active acoustic attenuation system for attenuating tonal noise associated with a fan having a plurality of blades, said system comprising:

an accelerometer mounted on said fan and generating a sinusoidal signal having a frequency representative of the rotational speed of said fan,

means clipping said sinusoidal signal to generate a clipped signal having a fundamental frequency equal to the frequency of rotation of said fan and containing harmonic frequencies of the fundamental frequency of said fan speed which include the fundamental frequency and harmonic frequencies of said blade pass tonal noise; speaker means mounted adjacent said fan and generating canceling sound for combination with and attenuation of said fundamental frequency and harmonic frequencies of the blade pass tonal noise of said fan;

an error microphone spaced from said fan and said speaker detecting said combination of tonal noise and canceling sound and generating an error signal therefrom; and

electronic controller means responsive to the clipped signal and said error signal for driving said speaker, said electronic controller means including adaptive filter means which accommodates for acoustics delays between said fan, the speaker and the error microphone.

5,010,577

ELECTRONIC VOLUME DEVICE

Masayuki Sakanishi, Tokyo, and Takaaki Ishii, Sagamihara, both of Japan, assignors to Kabushiki Kaisha Toshiba, Kawasaki, Japan

Filed Oct. 26, 1988, Ser. No. 262,649

Claims priority, application Japan, Oct. 29, 1987, 62-165985[U]

Int. Cl.[5] H03G *3/00*

U.S. Cl. 381—104 11 Claims

1 An electronic volume device comprising:

a volume control circuit constituted by a monolithic integrated circuit and having a signal output terminal, including switching control signal generating means for generating a switching control signal having a duty cycle corresponding to a desired proportion of attenuation, and means for switching the signal output terminal between a floating state and a grounded state in accordance with the switching signal generated by the switching control generating means;

a signal line through which an input analog signal is applied;

means for connecting the signal output terminal of the volume control circuit to the signal line; and

a low pass filter connected to the signal line for forming an output signal by eliminating high frequency components from the signal on the signal line.

5,010,578

METHOD AND APPARATUS FOR THE IDENTIFICATION OF METAL SURFACE FINISHES

Pierre Siener, Thionville, and Antoine Steiner, Metz, both of France, assignors to Institut de Recherches de la Siderurgie Francaise-Irsid, Puteaux, France

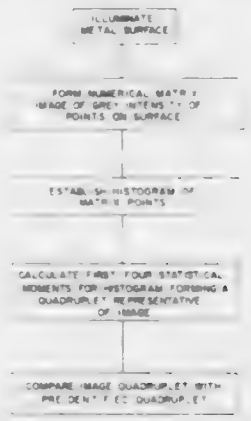
Filed Jul. 17, 1989, Ser. No. 380,354

Claims priority, application France, Jul. 20, 1988, 88 09833

Int. Cl.[5] G06K *9/00, 9/46, 9/52, 9/66*

U.S. Cl. 382—8 8 Claims

1. Method for the identification of metal surface finishes, wherein: at least a sample portion of said surface is omnidirectionally lit,



a numerical matrix image of said surface is formed, in which each matrix point is associated with a value of grey intensity as a function of the luminous intensity reflected by the corresponding element of the surface,

the set of collected values is processed in the following way:

a histogram is established, for the entire set of matrix points, of the number of points per level of grey intensity,

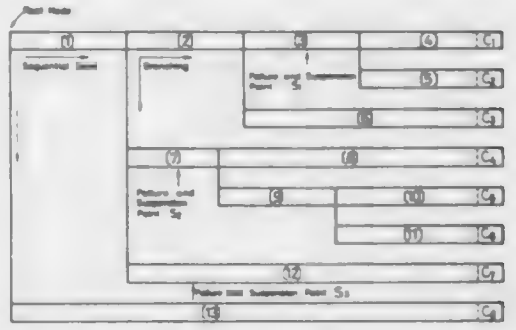
the first four statistical moments are calculated for said histogram, forming a quadruplet constituting four coordinates of an identification vector of the image, of order equal to or greater than four, said quadruplet being representative of the image,

said image quadruplet is compared to at least one of several pre-identified and catalogued quadruplets,

and if the image quadruplet is equal, allowing for predetermined tolerances for each moment, to one of said catalogued quadruplets, said image quadruplet is attributed the identity of said catalogued quadruplet.

5,010,579

HAND-WRITTEN, ON-LINE CHARACTER RECOGNITION APPARATUS AND METHOD



Kimiyoshi Yoshida, Kanagawa; Akio Sakano, Ibaraki; Hirofumi Tamori, Tokyo, and Masayuki Chatani, Kanagawa, all of Japan, assignors to Sony Corporation, Tokyo, Japan

Filed Aug. 24, 1989, Ser. No. 398,086

Claims priority, application Japan, Aug. 30, 1988, 63-215572

Int. Cl.[5] G06K *9/00*

U.S. Cl. 382—13 8 Claims

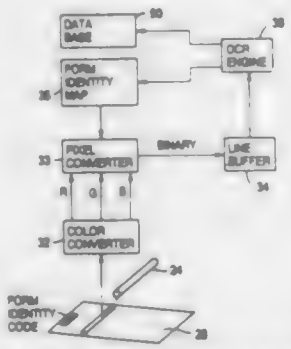
1. A hand-written, on-line character recognition apparatus comprising:

(a) means for electronically receiving hand-written stroke pattern information data;

(b) dictionary means organized in a tree and branch structure for electronically storing character data describing stroke characteristics of characters, the beginning and ending of each branch being taken as different nodes with one or more branches sharing the same nodes;

(c) evaluation scan control means for scanning the tree and branches of the dictionary means to search for character data corresponding to the hand-written stroke pattern information data, wherein the evaluation scan control means compares the hand-written stroke pattern information data with the character data stored in the successive branches of the dictionary means, continuing on to the next successive branch as long as the degree of inconsistency does not exceed a predetermined limit and returning

to the previous node to perform the same operation with respect to the character data stored in an alternative branch when the degree of inconsistency does exceed the predetermined limit; and



(d) save means for storing the conditions of the evaluation scan control means, wherein at least the conditions of the evaluation scanning existing at the beginning of each branch are saved in the save means upon branching in order to allow recursive use of the branches of the character data stored in the dictionary means when the evaluation scan control means has returned to the alternative branch after the degree of inconsistency exceeded the predetermined limit.

5,010,580

METHOD AND APPARATUS FOR EXTRACTING INFORMATION FROM FORMS

Kent D. Vincent, Cupertino, and Rueiming Jamp, Mountain View, both of Calif., assignors to Hewlett-Packard Company, Palo Alto, Calif.

Filed Aug. 25, 1989, Ser. No. 398,677
Int. Cl.[5] G06K *9/00*
U.S. Cl. 382—17 **7 Claims**

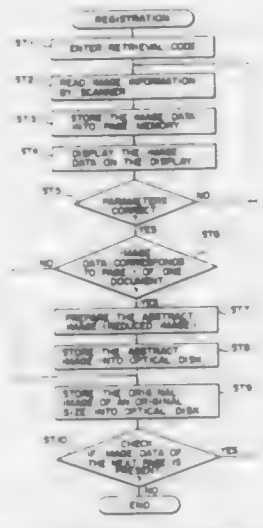
1. A system for extracting handwritten and typed information of a predetermined color from a form printed in a different color, comprising:

scanner means for scanning pixel locations on a printed form;

detector means for detecting at least two color values for each scanned pixel location;

comparator means for comparing the detected color values with reference color values;

identifier means for identifying and distinguishing ones of the pixel locations on the printed form from adjacent pixel locations by comparison of their color values to the reference color values, which identifier means provides a binary output for each scanned pixel location such that one state of the binary output represents correspondence between the detected color values of the scanned pixel location and at least one of the reference color values and, thereby, indicates whether handwritten and typed information on the printed form is to be extracted from the form when the color of the printing on the form is substantially different from the color of the handwritten and typed information at adjacent locations on the printed form; and



an optical character recognition engine for receiving data regarding identified ones of the pixel locations.

5,010,581

DATA PROCESSING APPARATUS HAVING FUNCTION FOR RETRIEVING ABSTRACT AND ORIGINAL IMAGE DATA

Masayuki Kanno, Fujisawa, Japan, assignor to Kabushiki Kaisha Toshiba, Kawasaki, Japan

Filed Nov. 30, 1988, Ser. No. 278,086
Claims priority, application Japan, Nov. 30, 1987, 62-302685
Int. Cl.[5] G06K *9/00*
U.S. Cl. 382—56 **24 Claims**

1. An image information filing apparatus comprising:

input means for inputting an original image which includes data covering a plurality of pages;

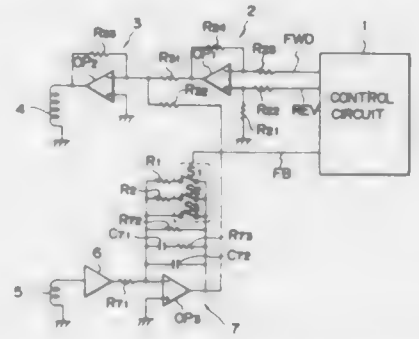
first memory means for temporarily storing the original image input by said input means;

drafting means for drafting an abstract image, the abstract image being formed of a predetermined portion or a combination of predetermined portions of the original image;

second memory means for storing the original image as stored in said first memory means and the abstract image drafted by said drafting means in association with the original image; and

retrieve means for retrieving the abstract image, based on retrieval data corresponding to both the original image and the abstract image, from the second memory means and for retrieving the original image associated with the abstract image when the retrieved abstract image is designated by the retrieval data,

in which said second memory means stores the abstract image as a first page of the original image.



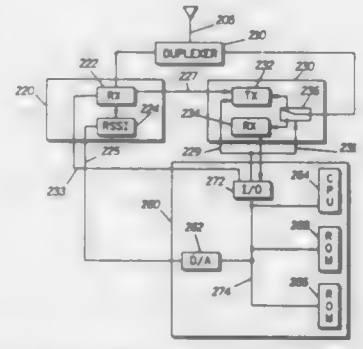
5,010,582

PICKUP DRIVING DEVICE FOR DISK PLAYER

Katsumi Kawamura, Tokorozawa, Japan, assignor to Pioneer Electronic Corporation, Tokyo, Japan

Filed Feb. 8, 1990, Ser. No. 476,948
Claims priority, application Japan, Apr. 4, 1989, 1-84974
Int. Cl.[5] H02P *5/00*
U.S. Cl. 388—815 **2 Claims**

1. A pickup driving device for a disk player comprising: a slider for holding a pickup for a disk player, a motor for moving said slider in a radial direction of a disk, a voltage generation means for generating a driving voltage corresponding to an operation command, an amplifier circuit for amplifying said driving voltage and supplying it to said motor, a speed detection means for obtaining a speed signal corresponding to a moving speed of said slider, and a negative feedback circuit for reverse amplifying said speed signal and for superimposing the voltage to said driving voltage, wherein the gain of said negative feedback circuit is variable, and the gain of said negative feedback circuit is made to vary correspondingly to the contents of said operation command, wherein the gain of said negative feedback circuit is made high when the content of said operation command is a first operation mode in which said slider is moved at a low speed, and the gain of said negative feedback circuit is made low when the content of said operation command is a second operation mode in which said slider is moved at a high speed.



5,010,583

REPEATER FOR A WIDE AREA COVERAGE SYSTEM

William D. Parken, Wilton Manors, Fla., assignor to Motorola, Inc., Schaumburg, Ill.

Filed Oct. 2, 1989, Ser. No. 415,818
Int. Cl.[5] H04B *17/00*
U.S. Cl. 455—9 **2 Claims**

1. A repeater for receiving a signal on an inbound channel and transmitting said signal on an outbound channel, comprising:

a first receiver means for receiving said signal on said inbound channel,

determination means for determining quality characteristic of said signal when received on said inbound channel,

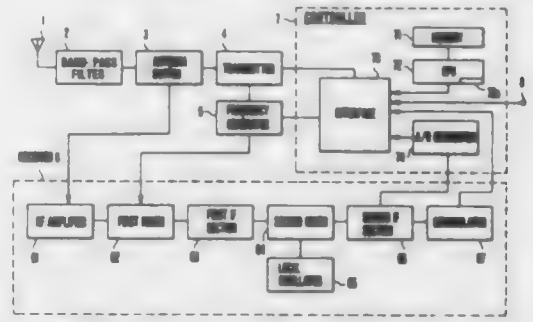
a second receiver means for monitoring presence of a channel activity on said outbound channel,

controller means responsive to presence of said channel activity on said outbound channel and said quality characteristic of said signal for generating a control signal:

transmitter means responsive to said control signal for transmitting said signal on said outbound channel.

5,010,584

MOBILE COMMUNICATION TRANSCEIVER



Kenji Seki, Tokyo, Japan, assignor to NEC Corporation, Japan

Filed Sep. 6, 1989, Ser. No. 403,601
Claims priority, application Japan, Sep. 14, 1988, 63-228504
Int. Cl.[5] H04B *1/44*
U.S. Cl. 455—83 **7 Claims**

1. A mobile communication transceiver including a receiver for demodulating a high-frequency signal, a transmitter for modulating a low-frequency signal into the high-frequency signal and amplifying the high-frequency signal, a frequency generator for transmitting a local frequency signal to said receiver in a reception mode and for transmitting the high-frequency signal for generating a transmission frequency signal to said transmitter in a transmission mode, a controller for transmitting data for changing a frequency of said frequency generator and for receiving transmission ON or OFF data to switch transmission and reception modes, and an antenna switch for switching between said receiver and said transmitter, wherein said controller comprises:

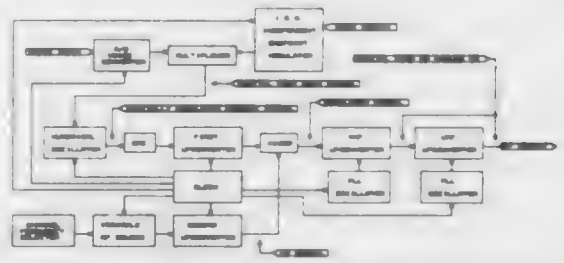
an A/D converter for converting an output voltage corresponding to a reception input voltage from said receiver into a digital signal;

a memory for storing a plurality of predetermined data for determining a speech enable electric field level and a

plurality of predetermined data for determining a high electric field level;

determining means for determining a speech enable electric field level by comparing the digital signal from said A/D converter with the speech enable electric field level determination data stored in said memory;

comparing means for comparing the digital signal supplied from said A/D converter through an interface with the high electric field level determination data stored in said memory when the high electric field level is determined; and



a CPU for selecting a determination level of the speech enable electric field level from the plurality of data stored in said memory.

5,010,585

DIGITAL DATA AND ANALOG RADIO FREQUENCY TRANSMITTER

Rafael A. Garcia, P.O. Box 530153, Miami Shores, Fla. 33153

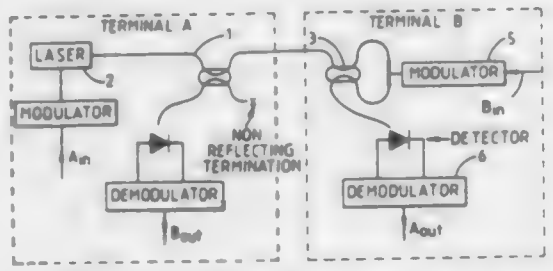
Filed Jun. 1, 1990, Ser. No. 531,587
Int. Cl.[5] H04B *1/04;* **H04L** *27/12*
U.S. Cl. 455—118 **11 Claims**

1. An RF transmitter for transmitting either analog voice or digital data comprising:

multiplexing means for switching between an analog voice input and digital data inputs to provide a selected signal,

numerical oscillator means connected to the output of the multiplexing means for converting the selected signal to a digitally modulated numeric frequency signal,

D/A conversion means connected to the output of the numerical oscillator means for converting the digitally modulated numeric frequency signal to an analog signal,



first upconversion means connected to the output of the D/A conversion means for upconverting the analog signal to a first higher frequency signal,
variable RF source means for providing a selected accurate preset frequency signal within a range of frequencies,
second upconversion means connected to the output of the variable RF source means for upconverting the preset frequency signal to a second higher frequency signal,
mixing means connected to the output of both the first and second upconversion means to provide a modulated signal,
clock means connected to the numerical oscillator means, the variable RF source means and the first and second upconversion means for providing synchronization for each said means.

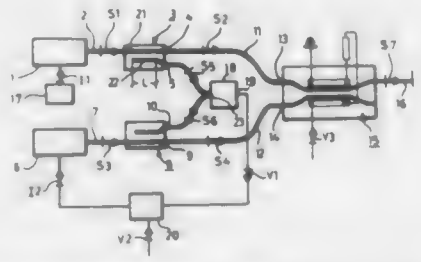
5,010,586

OPTICAL TWO-WAY TRANSMISSION SYSTEM WITH LOOP REFLECTOR MODULATOR

David B. Mortimore, Felixstowe, and David B. Payne, Wickham Market, both of England, assignors to British Telecommunications public limited company, England

PCT No. PCT/GB88/00291, § 371 Date Dec. 13, 1988, § 102(e) Date Dec. 13, 1988, PCT Pub. No. WO88/08232, PCT Pub. Date Oct. 20, 1988
PCT Filed Apr. 14, 1988, Ser. No. 288,251
Claims priority, application United Kingdom, Apr. 15, 1987, 8709072
Int. Cl.[5] H04B *10/12*
U.S. Cl. 455—605 12 Claims

1 A two way transmission system of the type for transmitting signals over a transmission line, said system comprising:
a first terminal operatively coupled to said transmission line, said first terminal having a source and further including:
a first modulation means for inputting a signal to said transmission line, and
a first demodulator for receiving return signals from a second terminal; and
a second terminal operatively coupled to said transmission line, said second terminal comprising:
a further demodulator, and
an interferometric loop reflector having a
second modulation means for inputting return signals to the transmission line.



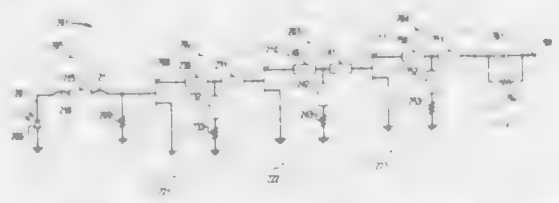
5,010,587

APPARTAUS FOR TRANSMITTING A COHERENT FREQUENCY MODULATED OPTICAL SIGNAL

Hans A. Eklund, Nykvarn, Sweden, assignor to Telefonaktiebolaget L M Ericsson, Stockholm, Sweden

Filed Mar. 8, 1989, Ser. No. 321,065
Claims priority, application Sweden, Mar. 11, 1988, 8800884
Int. Cl.[5] H04B *10/04*
U.S. Cl. 455—618 4 Claims

1. Apparatus for transmitting a coherent, frequency modulated optical signal, said apparatus comprising:
a laser light source transmitting at least two frequencies, each frequency having a spectral bandwidth which is less than 100 MHz,
an optical coupler connected to the laser light source and controllable by an electrical control means wherein the laser light source includes at least two laser devices each with an optical output connected to an optical input of the optical coupler and also to at least one photodetector, each photodetector connected to said optical outputs of two of said laser devices; at least one of the laser devices being connected to a frequency-determining normal control circuit which determines the light frequency of this laser device; each of the other of said at least two laser devices connected to a frequency control circuit which controls the light frequency of the respective laser device, and said at least one photodetector connected to one of



the frequency controlling circuits, said at least one photodetector transmits difference signals corresponding to the difference between frequencies of the laser devices, to the frequency controlling circuits which transmit control signals corresponding to said difference signals and at least one outside reference signal to the other of said at least two laser devices, so that the frequency differences of the laser devices are determined by said at least one outside reference signal; the electrical control means coupling the light alternatingly from the at least two laser devices to an output of the optical coupler such as to constitute the coherent, frequency modulated optical signal.

ULTRAWIDE-BANDWIDTH LOW-NOISE OPTICAL RECEIVER

James L. Gimlett, Holmdel, N.J., assignor to Bell Communications Research, Inc., Livingston, N.J.

Continuation-in-part of Ser. No. 166,267, Mar. 10, 1988, abandoned. This application Mar. 6, 1989, Ser. No. 318,844
Int. Cl.[5] H04B *10/06*
U.S. Cl. 455—619 16 Claims

1. An optical receiver having a bandwidth that extends from near dc to the multi-gigahertz range for converting a received optical signal to an amplified electrical signal at the output of the receiver, said receiver comprising:
photodetector means for converting the received optical signal to a proportional low-level electrical signal,
inductive/resistive frequency enhancement means connected to said photodetector means for extending the high frequency response of a first stage of an amplifying means and for providing a high input impedance to said first stage,
said amplifying means being connected between said frequency enhancement means and said receiver output and comprising a plurality of amplifying stages each comprising a transistor amplifier and a microwave matching circuit comprising a modified T-network having as series-arm impedances inductive elements and as a shunt-leg

impedance a microwave element in series with a resistor, said amplifying stages providing individual input and output impedances decreasing successively from said high input impedance at said first of said stages to a low output impedance at the last of said stages, the resistor in the shunt-leg of each modified T-network being chosen to extend the bandwidth of each stage to near the dc level and the values of said inductive and microwave elements being chosen to preserve the high frequency response as extended by said frequency enhancement means.

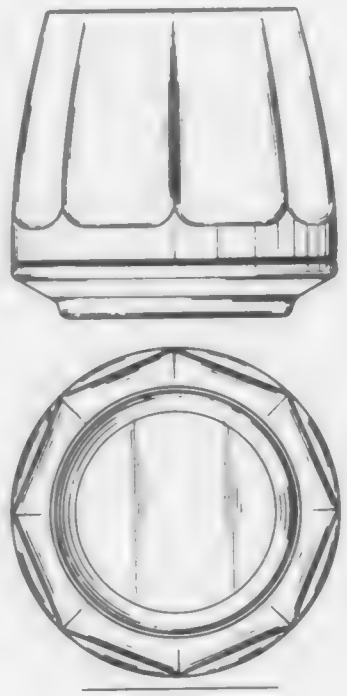
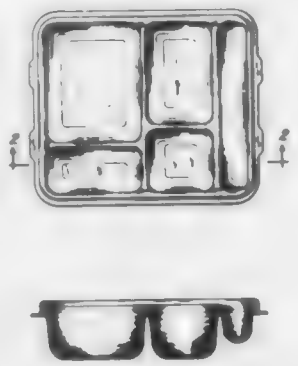
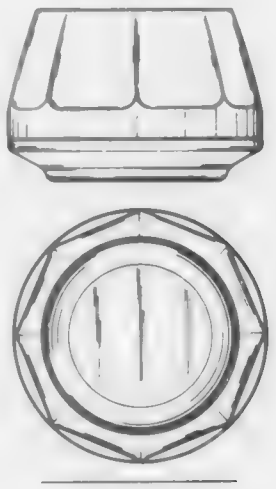
PORTABLE GAS GRILL
James C. Stephen, Arlington Heights; Erich J. Schlosser, Barrington, and Donald D. Pestka, Arlington Heights, all of Ill., assignors to Weber-Stephen Products Co., Palatine, Ill.
Filed Aug. 12, 1988, Ser. No. 231,843
Term of patent 14 years
U.S. Cl. D7—339



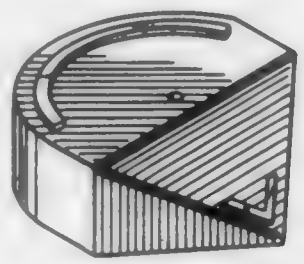
316,356
CAPPUCCINO MAKING ADAPTER FOR AN ESPRESSO MACHINE
Michael Borgmann, Solingen, Fed. Rep. of Germany, assignor to Robert Krups Stiftung & Co. KG., Solingen, Fed. Rep. of Germany
Filed Jan. 9, 1988, Ser. No. 205,114
Claims priority, application Fed. Rep. of Germany, Dec. 11, 1987, 5MR9831
Term of patent 14 years
U.S. Cl. D7—398



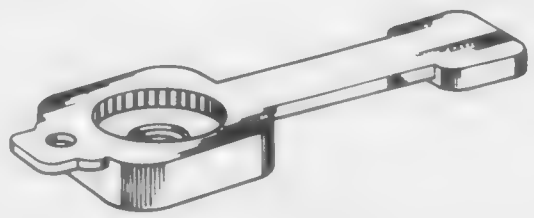
316,357
COOKING RANGE DRAWER PANEL
William D. Chanda, Louisville, Ky., assignor to General Electric Company, Louisville, Ky.
Filed Jun. 17, 1988, Ser. No. 208,018
Term of patent 14 years
U.S. Cl. D7—405



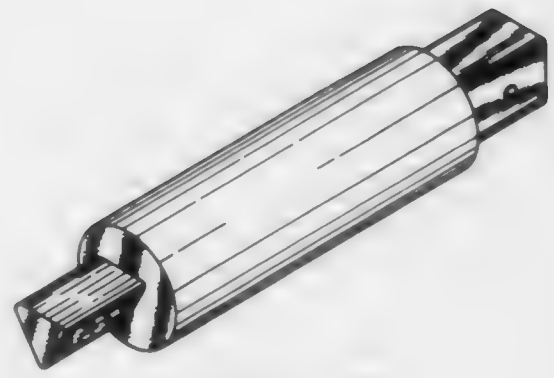
316,358
INSULATED DRINKING TUMBLER
Christopher S. Thorp, Mystic, Conn., assignor to Dinex International, Inc., Norwich, Conn.
Filed May 2, 1988, Ser. No. 189,520
The portion of the term of this patent subsequent to Apr. 23, 2005, has been disclaimed.
Term of patent 14 years
U.S. Cl. D7—531



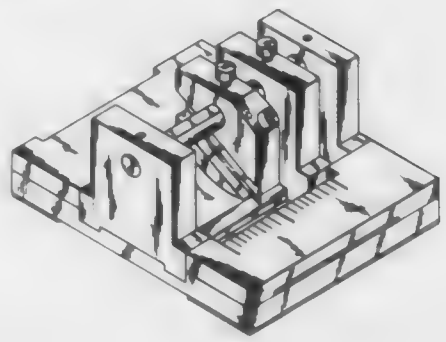
316,359
FOOD SERVING TRAY
John W. Anderson, Springfield, Mass., assignor to Temp-Tech Co. Inc., Springfield, Mass.
Filed Dec. 19, 1988, Ser. No. 286,059
Term of patent 14 years
U.S. Cl. D7—549



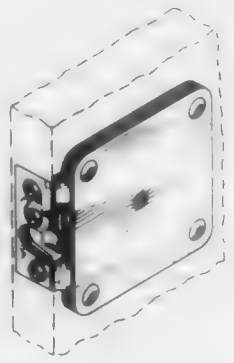
316,360
INSULATED BOWL
Christopher S. Thorp, Mystic, Conn., assignor to Dinex International, Inc., Norwich, Conn.
Filed May 2, 1988, Ser. No. 189,700
The portion of the term of this patent subsequent to Apr. 23, 2005, has been disclaimed.
Term of patent 14 years
U.S. Cl. D7—565



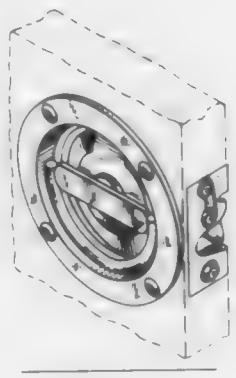
316,361
MARKING INSTRUMENT
Michael D. Kieffer, Avonmore, Pa., assignor to Mannington Mills, Inc., Salem, N.J.
Filed Apr. 11, 1988, Ser. No. 180,032
Term of patent 14 years
U.S. Cl. D8—14



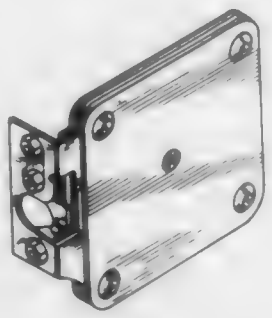
316,362
COMBINED BOTTLE CAP AND CAN TAB OPENER
Michael E. Hughes, 7112 Jefferson, NE., Albuquerque, N. Mex. 87109, assignor to Michael E. Hughes, Albuquerque, N. Mex.
Continuation-in-part of Ser. No. 798,577, Nov. 15, 1985. This application Mar. 30, 1987, Ser. No. 33,481
Term of patent 14 years
U.S. Cl. D8—40



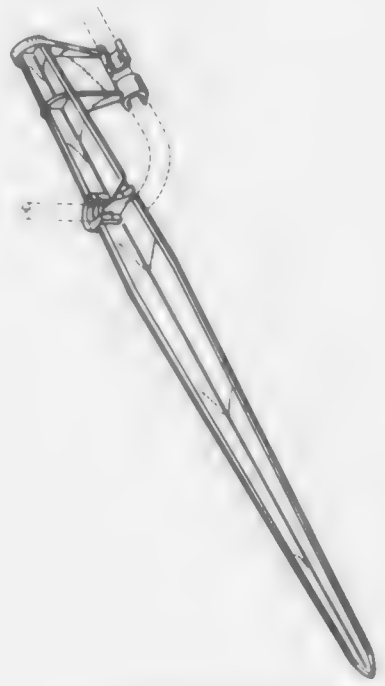
316,363
SOCKET ADAPTER FOR A DRILL
Rayford Lisenbee, P.O. Box 222, Winona, Miss. 38967
Filed Nov. 4, 1987, Ser. No. 116,677
Term of patent 14 years
U.S. Cl. D8—70



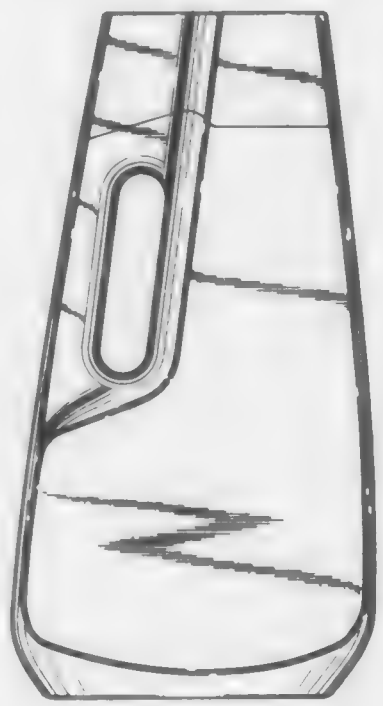
316,364
APPARATUS FOR SLITTING ELONGATED FLEXIBLE TAPE
William C. Isaacson, North Hollywood, and Herbert A. Farmery, Anaheim, both of Calif., assignors to Keen Corporation, New York, N.Y.
Filed May 20, 1987, Ser. No. 52,563
Term of patent 14 years
U.S. Cl. D8—98



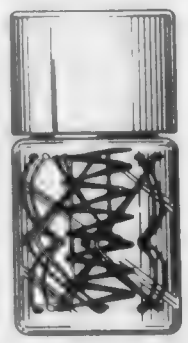
316,365
ROTARY LOCK
Randall C. Hansen, Lake Forest, Ill., and Gilbert H. Krahn, Kenosha, Wis., assignors to A.L. Hansen Manufacturing Company, Waukegan, Ill.
Filed Jan. 13, 1989, Ser. No. 297,064
Term of patent 14 years
U.S. Cl. D8—331



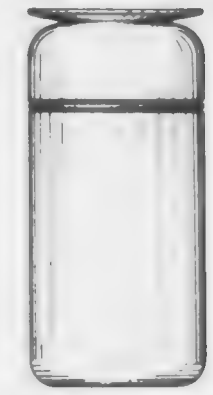
316,366
ROTARY LOCK
Randall C. Hansen, Lake Forest, Ill., and Gilbert H. Krahn, Kenosha, Wis., assignors to A. L. Hansen Manufacturing Company, Waukegan, Ill.
Filed Jan. 13, 1989, Ser. No. 297,534
Term of patent 14 years
U.S. Cl. D8—331



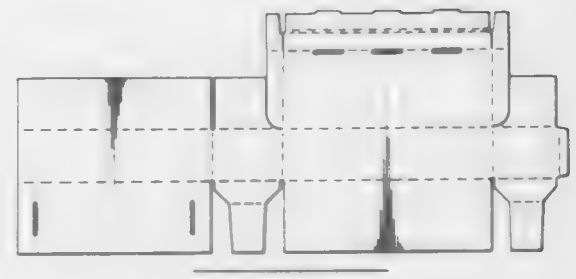
316,367
GROUND STAKE FOR RETAINING IRRIGATION CONDUIT
Donald O. Olson, 1935 Altozana Dr., El Cajon, Calif. 92020
Filed Dec. 27, 1988, Ser. No. 290,096
Term of patent 14 years
U.S. Cl. D8—356



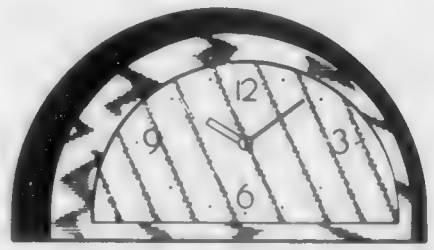
316,368
CLAMP
Daniel Kirby, Box 773, Kahnawake, Quebec J0L 1B0, Canada
Filed Mar. 23, 1989, Ser. No. 327,578
Term of patent 14 years
U.S. Cl. D8—395



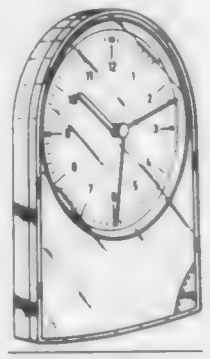
316,369
COMBINED BOTTLE AND MEASURING CUP COVER
Joseph Thompson, Upper Saddle River, N.J., assignor to Sterling Drug Inc., Rensselaer, N.Y.
Filed May 31, 1988, Ser. No. 200,369
Term of patent 14 years
U.S. Cl. D9—337



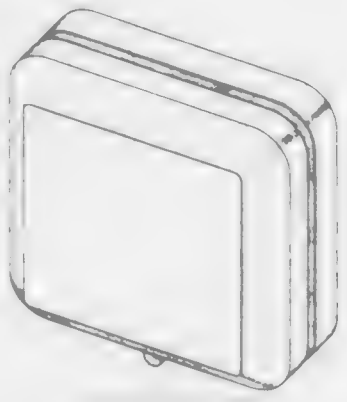
316,370
COSMETIC CONTAINER
David Hoenig, East Brunswick, N.J., assignor to Revlon, Inc., New York, N.Y.
Filed Oct. 7, 1988, Ser. No. 255,171
Term of patent 14 years
U.S. Cl. D9—337



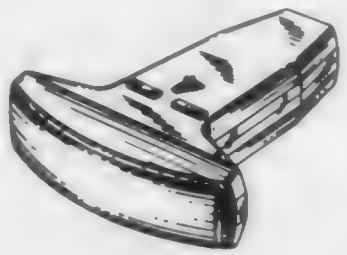
316,371
CONTAINER
Jean-Jacques Vola, Verrieres-le-Buisson, France, assignor to Honeywell, Inc., Minneapolis, Minn.
Filed Sep. 8, 1988, Ser. No. 242,276
Term of patent 14 years
U.S. Cl. D9—353



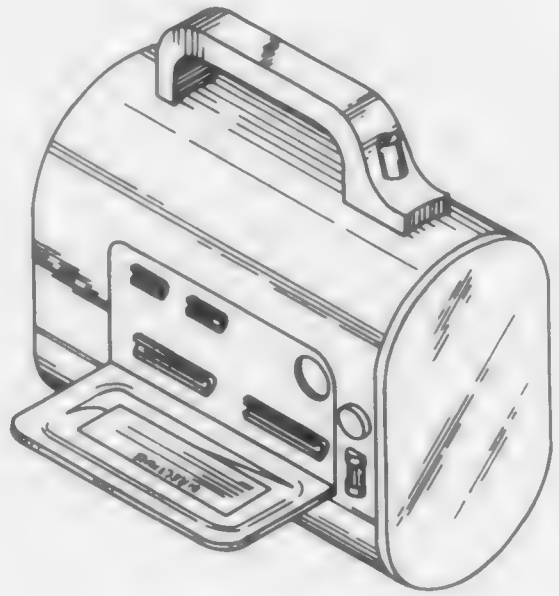
316,372
STORAGE BOX BLANK
Wedon G. Boggus, Jr., San Angelo, Tex., assignor to Stor-A-File, Inc., San Angelo, Tex.
Division of Ser. No. 67,911, Jun. 29, 1987, Pat. No. 8,312,402.
This application Sep. 4, 1990, Ser. No. 576,900
Term of patent 14 years
U.S. Cl. D9—433



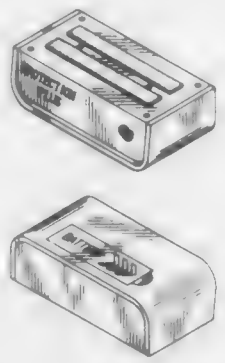
316,373
CLOCK
Seiji Odaka, Tokyo, Japan, assignor to Seikosha Co., Ltd., Japan
Filed Dec. 21, 1987, Ser. No. 135,629
Claims priority, application Japan, Jun. 22, 1987, 62-25327
Term of patent 14 years
U.S. Cl. D10—28



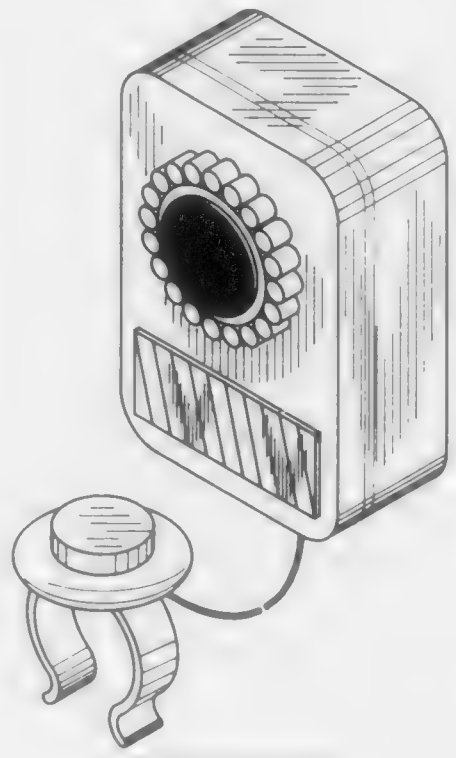
316,374
CLOCK
Hartmut Esslinger, and Wolfgang Jeschke, both of Altensteig, Fed. Rep. of Germany, assignors to Junghans Uhren GmbH, Schramberg, Fed. Rep. of Germany
Filed Jan. 4, 1988, Ser. No. 140,411
Claims priority, application Fed. Rep. of Germany, Jul. 1, 1987, MR 1321 0B
Term of patent 14 years
U.S. Cl. D10—28



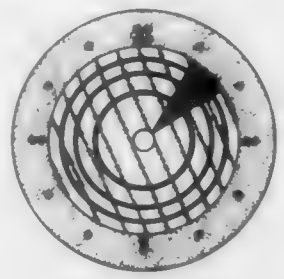
316,375
THERMOSTAT
Robert J. Tiedemann, Stamford, Conn., assignor to ITT Corporation, New York, N.Y.
Filed Jun. 27, 1989, Ser. No. 372,783
Term of patent 14 years
U.S. Cl. D10—50



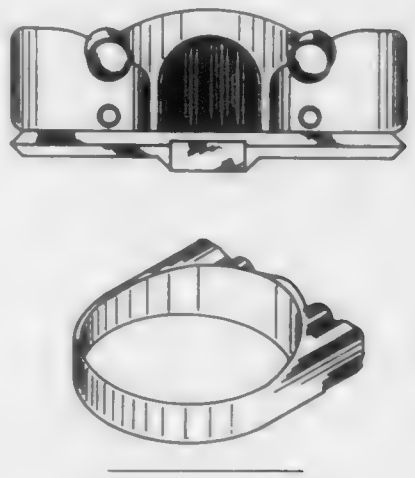
316,376
ULTRASONIC PROBE
Patrick G. Dubut, St. Paul de Vence, France, assignor to CGR Ultrasonic, Villenoy-les-Meaux, France
Filed May 22, 1987, Ser. No. 53,420
Claims priority, application France, Nov. 25, 1986, 86 6228
Term of patent 14 years
U.S. Cl. D10—60



316,377
WATTMETER
Dan B. Merlin, 4012 Tybo Ave., Las Vegas, Nev. 89110
Filed Nov. 14, 1988, Ser. No. 270,281
Term of patent 14 years
U.S. Cl. D10—78

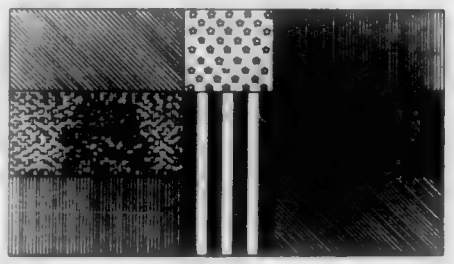


316,378
AUTOMOBILE ANTI-THEFT ALARM
John Liantonio, 3 Wichard Dr., Oakdale, N.Y. 11769
Filed Dec. 6, 1988, Ser. No. 280,525
Term of patent 14 years
U.S. Cl. D10—106

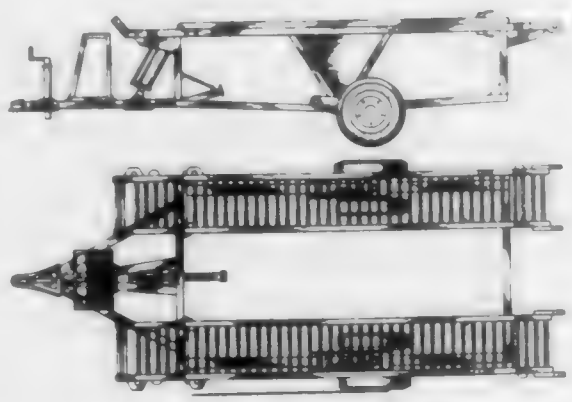


316,379
ALARM FOR A BICYCLE
Darren S. Labas, 142 - 8 St. NW., Medicine Hat, Alberta, Canada T1A 6P3
Filed Jul. 7, 1988, Ser. No. 216,249
Term of patent 14 years
U.S. Cl. D10—116

316,380
WATCH DIAL
Ryoichi Kaneko, Tokyo, Japan, assignor to Seikosha Co., Ltd., Japan
Filed Jun. 1, 1988, Ser. No. 201,094
Claims priority, application Japan, Dec. 7, 1987, 62-50034
Term of patent 14 years
U.S. Cl. D10—126

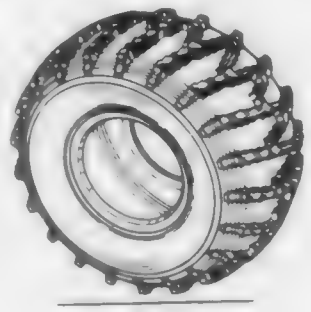


316,381
FINGER RING
Brian A. Klym, 22 Kinkora Drive, Winnipeg, Manitoba, Canada R3R 2L6
Filed Feb. 29, 1988, Ser. No. 161,675
Term of patent 14 years
U.S. Cl. D11—30



316,382
PLANT WATERER
Moises B. Lorenzana, 601 Lake Hinsdale Dr., Willowbrook, Ill. 60559, and Vance A. Lorenzana, 698 Spring Hill Cir., Naperville, Ill. 60540
Filed Dec. 27, 1988, Ser. No. 289,751
Term of patent 14 years
U.S. Cl. D11—164

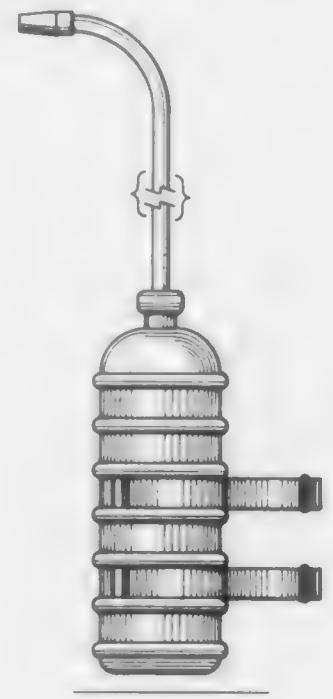
316,383
FLAG
Vincent Paramore, 2207 Johnson St., Hollywood, Fla. 33020
Filed May 31, 1990, Ser. No. 531,794
Term of patent 14 years
U.S. Cl. D11—167



316,384
VEHICLE SERVICE TRAILER, OR SIMILAR ARTICLE
Raymond E. Teagarden, 9430 Mission Blvd., Riverside, Calif. 92509
Filed Nov. 28, 1988, Ser. No. 276,554
Term of patent 14 years
U.S. Cl. D12—94

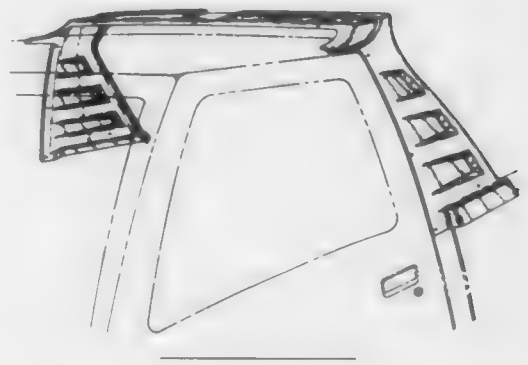
316,385
VEHICLE TIRE
Peter R. Marriott, Hurley, Nr. Atherstone, England, assignor to SP Tyres UK Ltd., Birmingham, England
Filed May 5, 1988, Ser. No. 190,520
Claims priority, application United Kingdom, Nov. 6, 1987, 1046105
Term of patent 14 years
U.S. Cl. D12—146

316,386
AUTOMOBILE TIRE
[redacted] Fujiki, Hyogo, Japan, assignor to Sumitomo Rubber Industries, Ltd., Hyogo, Japan
Filed May 25, 1989, Ser. No. 357,215
Claims priority, application Japan, Dec. 26, 1988, 63-51[redacted]
Term of patent 14 years
U.S. Cl. D12—146

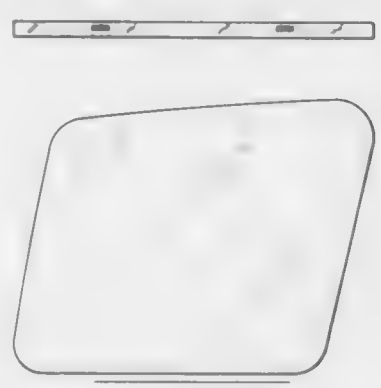


316,387
TIRE
Pentti Eromäki, Nokia, Finland, assignor to Nokia Tyres Limited, Nokia, Finland
Filed Dec. 14, 1988, Ser. No. 284,474
Claims priority, application Finland, Jun. 15, 1988, 541/88
Term of patent 14 years
U.S. Cl. D12—147

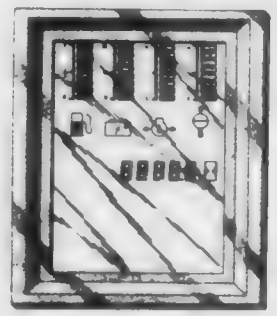
316,388
TIRE
Bill J. Wallet, Marshallville, and Joseph F. Molnar, Wadsworth, both of Ohio, assignors to Bridgestone/Firestone, Inc., Akron, Ohio
Filed Jun. 23, 1989, Ser. No. 370,510
Term of patent 14 years
U.S. Cl. D12—147



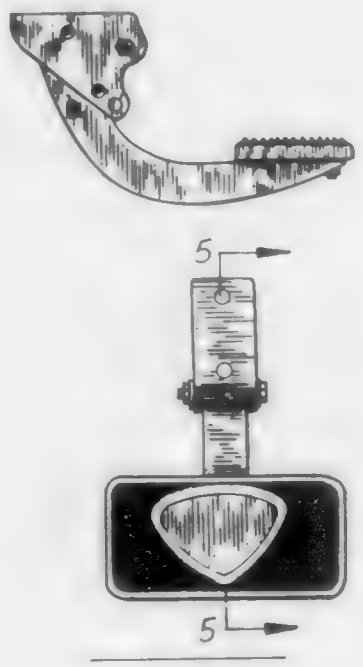
316,389
BOTTLE FOR ATTACHMENT TO A BICYCLE
Daniel H. Wood, 2108 Marchita Way, Carmichael, Calif. 95608, and Thomas S. W. Lee, 8462 Rick Mary Ct., Fair Oakes, Calif. 95628
Filed Sep. 2, 1988, Ser. No. 240,105
Term of patent 14 years
U.S. Cl. D12—158



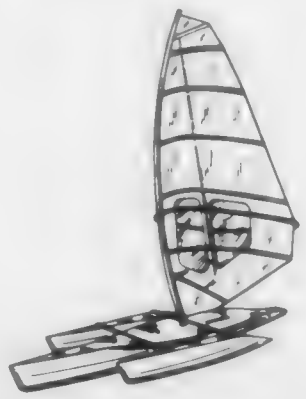
316,390
AIR DAM FOR AN AUTOMOBILE
Kazuhiro Ichinose, Tokyo, Japan, assignor to Honda Giken Kogyo Kabushiki Kaisha, Tokyo, Japan
Filed Aug. 8, 1989, Ser. No. 391,374
Claims priority, application Japan, Feb. 8, 1989, 1-4411
Term of patent 14 years
U.S. Cl. D12—181



316,391
CAB FAIRING FOR TRUCKS
David M. Lund, Coon Rapids, Minn., assignor to Lund Industries, Incorporated, Minneapolis, Minn.
Filed Sep. 25, 1989, Ser. No. 410,048
Term of patent 14 years
U.S. Cl. D12—181



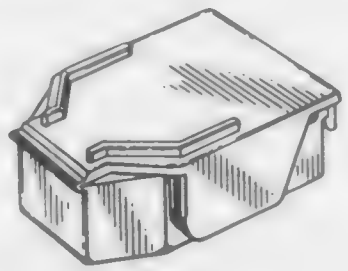
316,392
GLARE REDUCTION SHIELD FOR ATTACHMENT TO A VEHICLE MIRROR OR SIMILAR ARTICLE
Charles C. Rebeck, R.R. 3, Box 28A, Winamac, Ind. 46996
Filed Aug. 15, 1988, Ser. No. 232,653
Term of patent 14 years
U.S. Cl. D12—187



316,393
VEHICLE MONITORING DISPLAY PANEL
Wally L. Kaczmarski, Lisbon, N. Dak., assignor to Clark Equipment Company, South Bend, Ind.
Filed Jul. 25, 1988, Ser. No. 224,472
Term of patent 14 years
U.S. Cl. D12—192

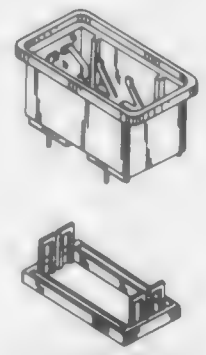
316,394
COMBINED VEHICLE STEP AND MOUNTING BRACKET
Jeff A. Carr, 10433 Samoline Ave., Downey, Calif. 90241
Filed Oct. 30, 1989, Ser. No. 428,749
Term of patent 14 years
U.S. Cl. D12—203

316,395
SAILING CRAFT
Toshiharu Yamada, Cypress, Calif., and Kunihiko Kobayashi, Iwata, Japan, assignors to Yamaha Hatsudoki Kabushiki Kaisha, Iwata, Japan
Filed Feb. 24, 1989, Ser. No. 315,034
Term of patent 14 years
U.S. Cl. D12—304

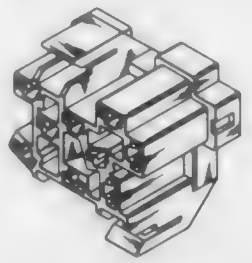


316,396
UNINTERRUPTIBLE POWER SUPPLY CELL
Jean Decoene, Charavines, and Georges Herman, Grenoble, both of France, assignors to Merlin Gerin, Meylan, France
Filed Aug. 13, 1987, Ser. No. 84,755
Claims priority, application France, Feb. 13, 1987, 505
Term of patent 14 years
U.S. Cl. D13—101

316,397
PORTABLE, RECHARGEABLE STORAGE BATTERY
Raymond F. Herbert, Yorkshire, United Kingdom, assignor to Powerbank Limited, United Kingdom
Filed Aug. 16, 1988, Ser. No. 232,895
Term of patent 14 years
U.S. Cl. D13—106

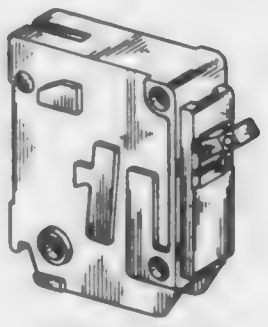


316,398
HOUSING FOR A BATTERY TERMINAL CONNECTOR
Jeremy C. Hill, 603½ Orchid Ave., Corona del Mar, Calif. 92628, assignor to Ronald G. Slagle, Laguna Beach and Jeremy C. Hill, Corona del Mar, both of, Calif.
Filed Sep. 19, 1988, Ser. No. 246,380
Term of patent 14 years
U.S. Cl. D13—120

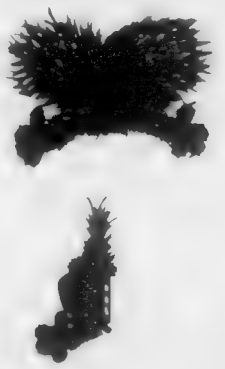


316,399
PANEL ELECTRICAL CONNECTOR
Richard F. Wharton, Glenview, Ill., assignor to Safco Corporation, Chicago, Ill.
Filed Oct. 28, 1988, Ser. No. 264,188
Term of patent 14 years
U.S. Cl. D13—133

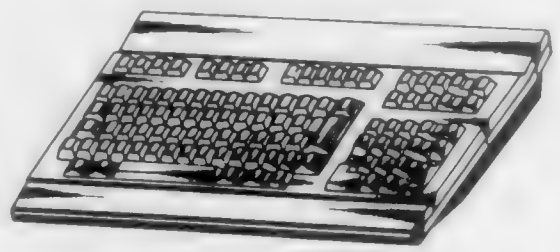
316,400
OUTER HOUSING OF ELECTRICAL CONNECTOR
Yasuharu Moriai, and Osamu Ito, both of Suzuka, Japan, assignors to Sumitomo Wiring Systems, Ltd., Yokkaichi, Japan
Filed Nov. 14, 1988, Ser. No. 271,082
Claims priority, application Japan, May 13, 1988, 63-18980
Term of patent 14 years
U.S. Cl. D13—133



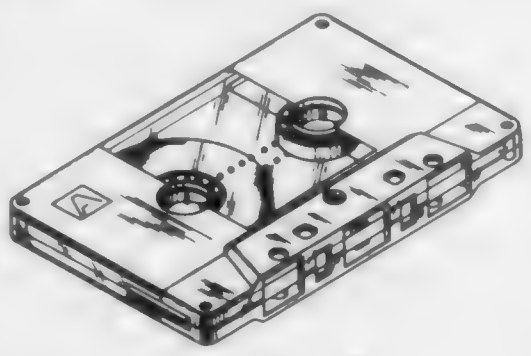
316,401
HOUSING FOR AN ELECTRICAL CONNECTOR
Hitoshi Sakai, Gotenba, Japan, assignor to Yazaki Corporation, Japan
Filed Oct. 7, 1988, Ser. No. 255,526
Claims priority, application Japan, Apr. 7, 1988, 63-13736
Term of patent 14 years
U.S. Cl. D13—146



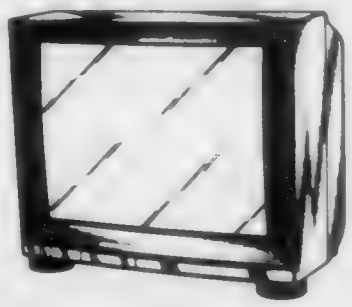
316,402
COVER FOR AN AUTOMOBILE-TYPE CIGARETTE LIGHTER RECEPTACLE
Larry Baker, 608 Albert Way, Petaluma, Calif. 94952
Filed Feb. 24, 1987, Ser. No. 18,184
Term of patent 14 years
U.S. Cl. D13—156



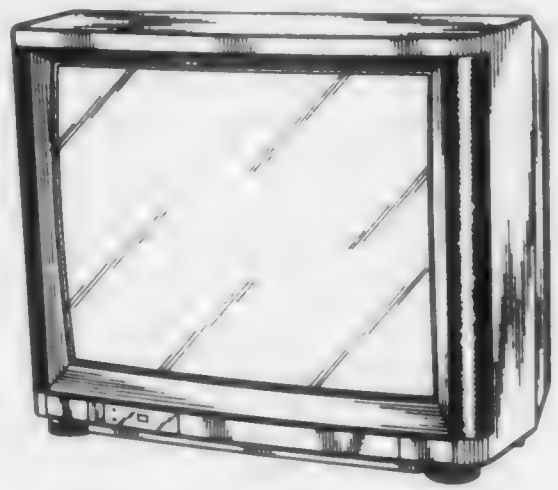
316,403
BREAKER CASE
James M. Mercer, Charlottesville, Va., and Keith A. Singer, Wilmington, N.C., assignors to Cooper Industries, Inc., Houston, Tex.
Filed Jun. 19, 1989, Ser. No. 368,018
Term of patent 14 years
U.S. Cl. D13—160



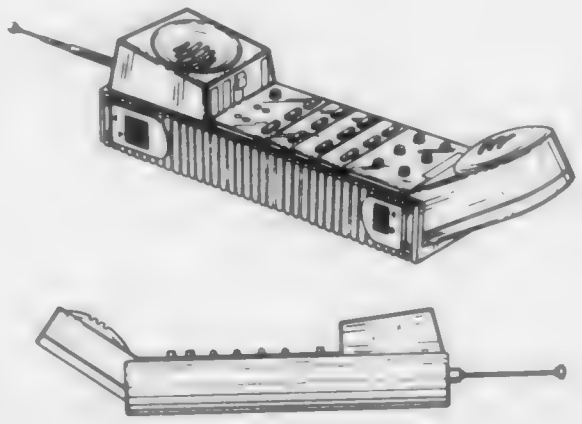
316,404
MAGNET
Ronald K. Calleja, 12 Primula Avenue, North Altona, Victoria 3025, Australia
Filed Jun. 13, 1988, Ser. No. 211,100
Claims priority, application Australia, Dec. 18, 1987, 4714/87
Term of patent 14 years
U.S. Cl. D13—183



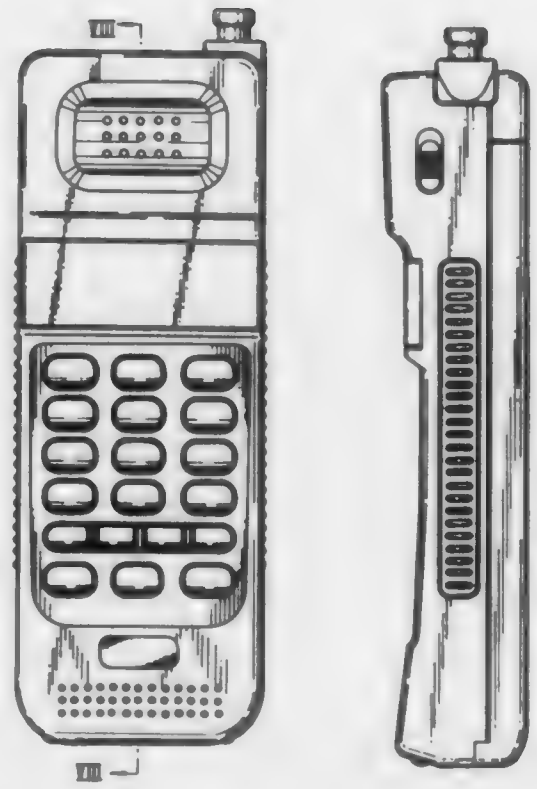
316,405
KEYBOARD FOR DATA PROCESSING SYSTEM
Isamu Yoshitake, Fuchu, Japan, assignor to Casio Computer Co., Ltd., Tokyo, Japan
Filed Feb. 27, 1989, Ser. No. 316,451
Term of patent 14 years
U.S. Cl. D14—100



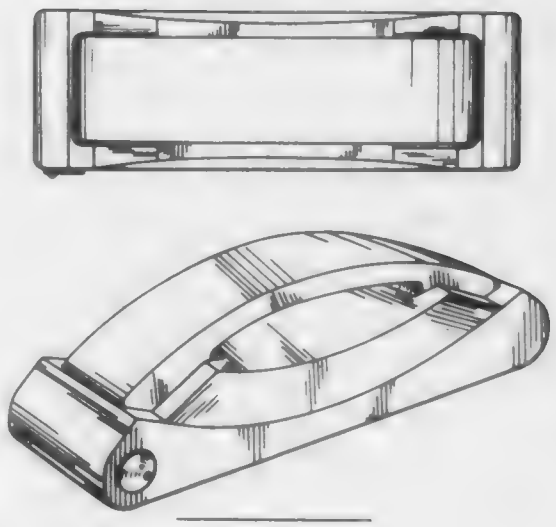
316,406
AUDIO CASSETTE
Fuyuki Yoshera, Tokyo, Japan, assignor to Fuji Photo Film Co., Ltd., Kanagawa, Japan
Filed Dec. 29, 1988, Ser. No. 291,877
Claims priority, application Japan, Jun. 29, 1988, 63-25956
Term of patent 14 years
U.S. Cl. D14—121



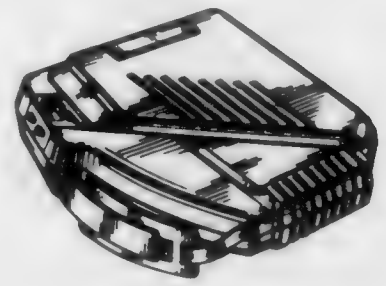
316,407
TELEVISION RECEIVER
Masao Yoshikawa, and Yuzo Fujii, both of Osaka, Japan, assignors to Matsushita Electric Industrial Co., Ltd., Osaka, Japan
Filed May 31, 1989, Ser. No. 361,002
Claims priority, application Japan, Dec. 2, 1988, 63-47323
Term of patent 14 years
U.S. Cl. D14—126



316,408
TELEVISION RECEIVER
Hiroyuki Tsubaki; Masao Yoshikawa, and Kazutoshi Masunari, all of Osaka, Japan, assignors to Matsushita Electric Industrial Co., Ltd., Osaka, Japan
Filed Jun. 6, 1989, Ser. No. 362,301
Claims priority, application Japan, Dec. 9, 1988, 63-48184
Term of patent 14 years
U.S. Cl. D14—126

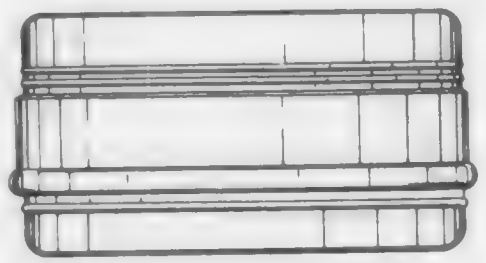


316,409
CORDLESS HANDSET TELEPHONE
David A. Sharbaugh, Irvine, Calif., assignor to PhoneMate, Torrance, Calif.
Filed Nov. 16, 1989, Ser. No. 437,974
Term of patent 14 years
U.S. Cl. D14—138

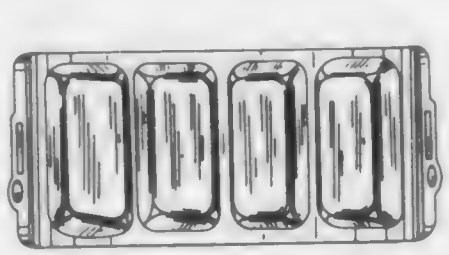


316,410
PORTABLE RADIO TELEPHONE
Katsuhito Watanabe, and Naoko Seki, both of Tokyo, Japan, assignors to Oki Electric Industry Co., Ltd., Tokyo, Japan
Filed Aug. 21, 1990, Ser. No. 571,092
Claims priority, application Japan, Feb. 21, 1990, 2-5181
Term of patent 14 years
U.S. Cl. D14—138

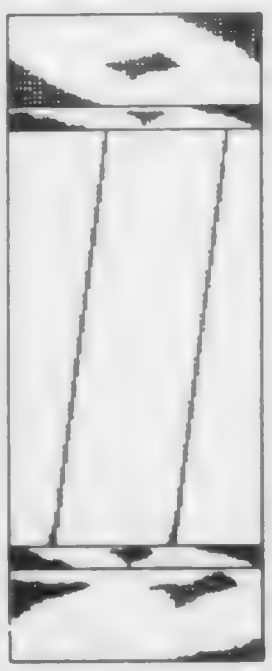
316,411
TELEPHONE
Cosmo Falloro, Pavia, Italy, assignor to Haina S.p.A., Rivoli Torino, Italy
Filed Jul. 6, 1990, Ser. No. 549,499
Claims priority, application Italy, Jan. 23, 1990, 52837/90[U]
Term of patent 14 years
U.S. Cl. D14—147



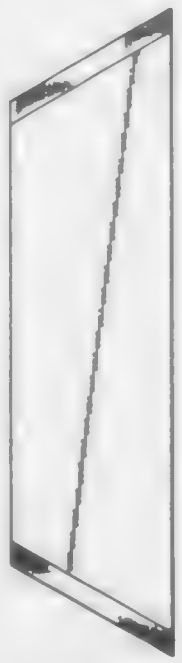
316,412
VOICE TRANSLATOR
Allen W. VanNoy, Bothell, Wash., assignor to Advanced Products and Technologies, Inc., Redmond, Wash.
Filed Jul. 5, 1988, Ser. No. 216,698
Term of patent 14 years
U.S. Cl. D14—158

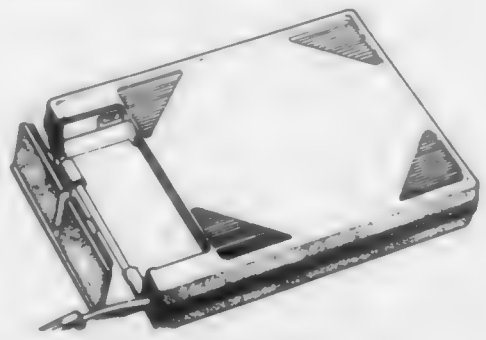


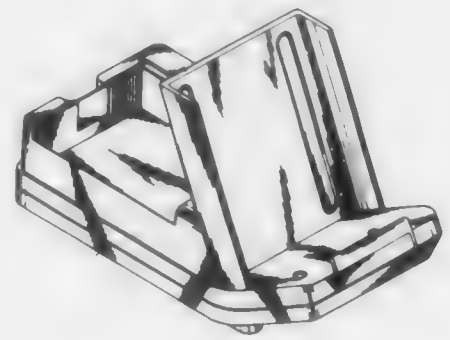
316,413
LOUDSPEAKER CABINET
Andrew E. Flanders, 570 N. 10th Ave., Cornelius, Oreg. 97113
Filed Jun. 25, 1987, Ser. No. 66,796
Term of patent 14 years
U.S. Cl. D14—214



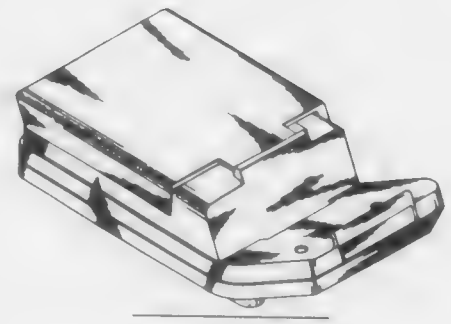
316,414
CUSHION FOR ATTACHMENT TO THE ARCUATE HEADBAND CONNECTING THE EARPIECE MEMBERS OF A COMMUNICATIONS HEADSET
Domenic L. Fratantonio, and Robert E. Dalbec, both of Worcester, Mass., assignors to David Clark Company Incorporated, Worcester, Mass.
Filed Jan. 27, 1989, Ser. No. 302,731
Term of patent 14 years
U.S. Cl. D14—223

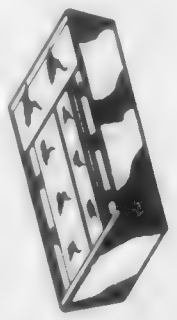




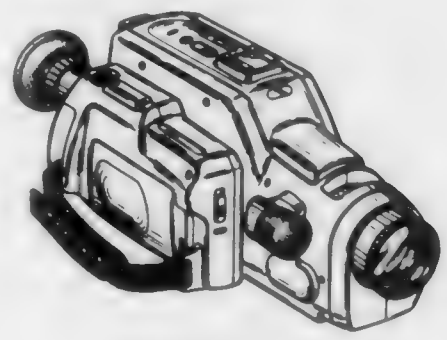


316,415
HOUSING FOR AN UNDER TELEPHONE EXTENSION REEL
Paul S. Hepworth, Guildford, England, assignor to Plessey Plugs Limited, Burton on Trent, England
Filed Sep. 8, 1988, Ser. No. 404,439
Claims priority, application United Kingdom, Mar. 9, 1989, 1057746
Term of patent 14 years
U.S. Cl. D14—231

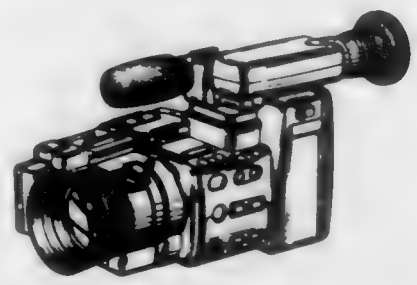




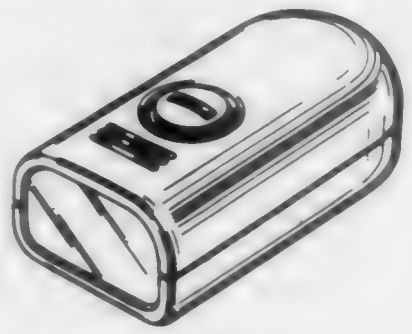
316,416
STAND FOR A PORTABLE TELEPHONE
Malcolm C. Cant, Wokingham, and Ron Major, Stroud, both of England, assignors to Technophone Limited, Surrey, England
Filed Jun. 7, 1989, Ser. No. 364,001
Claims priority, application United Kingdom, Jan. 31, 1989, 1056756
Term of patent 14 years
U.S. Cl. D14—252



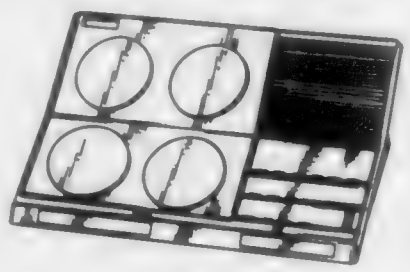
316,417
RADIO HOUSING OR SIMILAR ARTICLE
Eugene J. Wall, LaGrange; Bruce D. Hillier, Hoffman Estates, and Terrance N. Taylor, Cary, all of Ill., assignors to Motorola, Inc., Schaumburg, Ill.
Filed Apr. 27, 1987, Ser. No. 43,135
Term of patent 14 years
U.S. Cl. D14—299



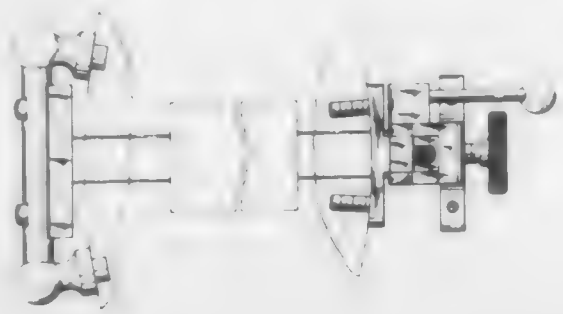
316,418
TURBINE HOUSING
Steven R. Benson, 5919 S. 350 West, Murray, Utah 84107
Filed Jan. 17, 1989, Ser. No. 296,987
Term of patent 14 years
U.S. Cl. D15—5



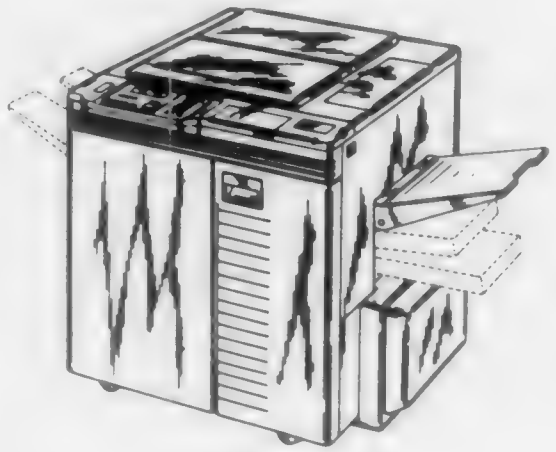
316,419
COMBINED VIDEO CAMERA AND TAPE RECORDER
Yoshiyuki Matsumura, Kunitachi, Japan, assignor to Canon Kabushiki Kaisha, Tokyo, Japan
Filed Dec. 2, 1988, Ser. No. 279,149
Claims priority, application Japan, Jun. 6, 1988, 63-22369
Term of patent 14 years
U.S. Cl. D16—202



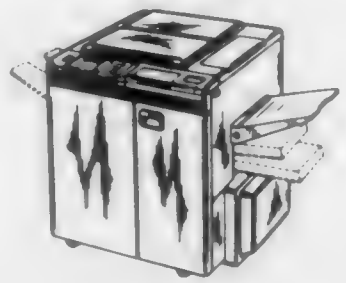
316,420
VIDEO CAMERA WITH VIDEO TAPE RECORDER
Chifuyu Tanaka, Tokyo, Japan, assignor to Canon Kabushiki Kaisha, Tokyo, Japan
Filed Jan. 16, 1989, Ser. No. 367,102
Claims priority, application Japan, Dec. 19, 1988, 63-49434
Term of patent 14 years
U.S. Cl. D16—202



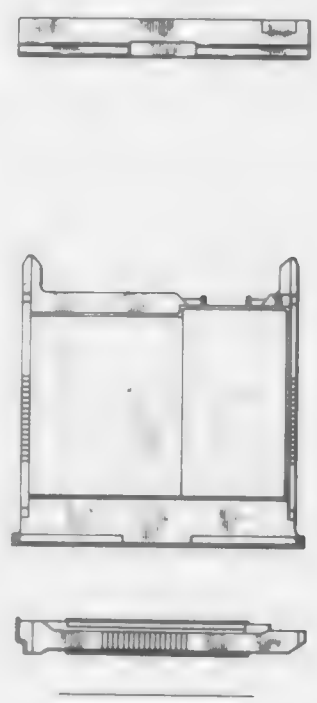
316,421
INFRARED IRRADIATION DEVICE FOR VIDEO CAMERA
Toru Shinano, Yokohama, and Kazuaki Sakuta, Koganei, both of Japan, assignors to Canon Kabushiki Kaisha, Tokyo, Japan
Filed Feb. 2, 1988, Ser. No. 151,085
Claims priority, application Japan, Aug. 4, 1987, 62-31919
Term of patent 14 years
U.S. Cl. D16—237



316,422
ELECTRONIC DRUM
Junko Mine, Hamamatsu, Japan, assignor to Yamaha Corporation, Japan
Filed Jun. 13, 1988, Ser. No. 207,438
Claims priority, application Japan, Dec. 10, 1987, 62-50520
Term of patent 14 years
U.S. Cl. D17—22

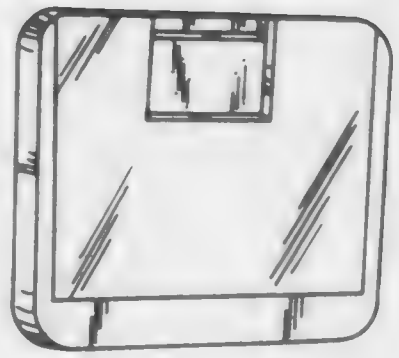


316,423
SNARE DRUM THROW OFF
Joseph P. Montineri, P.O. Box 3186, Dept. C, Vernon, Conn. 06066
Filed Jul. 12, 1988, Ser. No. 217,811
Term of patent 14 years
U.S. Cl. D17—22

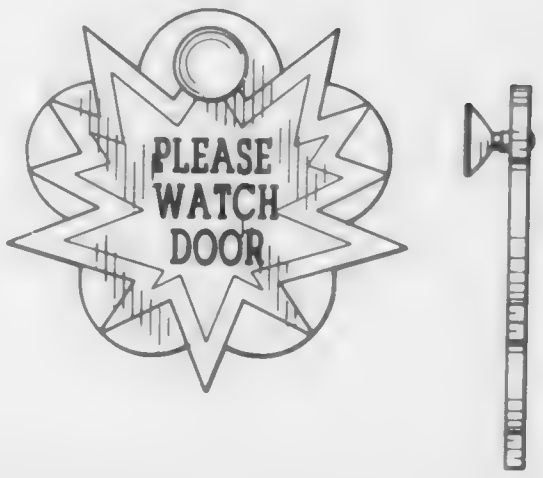


316,424
COPYING MACHINE
Takeshi Komada, Yokohama; Tomohiko Hirata, Kawasaki, and Minoru Aoyama, Tokyo, all of Japan, assignors to Canon Kabushiki Kaisha, Tokyo, Japan
Filed Jul. 18, 1988, Ser. No. 220,111
Claims priority, application Japan, Jan. 19, 1988, 63-1809
The portion of the term of this patent subsequent to Apr. 23, 2005, has been disclaimed.
Term of patent 14 years
U.S. Cl. D18—39

316,425
COPYING MACHINE
Minoru Aoyama, Tokyo; Takeshi Komada, Yokohama, and Tomohiko Hirata, Kawasaki, all of Japan, assignors to Canon Kabushiki Kaisha, Tokyo, Japan
Filed Oct. 21, 1988, Ser. No. 260,490
Claims priority, application Japan, Apr. 25, 1988, 63-17020
The portion of the term of this patent subsequent to Apr. 23, 2005, has been disclaimed.
Term of patent 14 years
U.S. Cl. D18—39



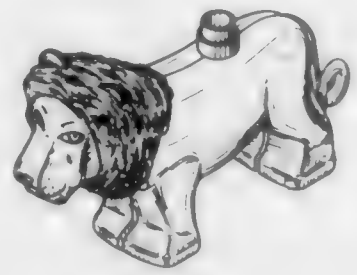
316,426
PAPER SUPPLY CASSETTE
Takeshi Komada, Yokohama, and Masataka Isomoto, Kawasaki, both of Japan, assignors to Canon Kabushiki Kaisha, Tokyo, Japan
Filed Jul. 19, 1988, Ser. No. 221,181
Claims priority, application Japan, Jan. 22, 1988, 63-2[illegible]2
Term of patent 14 years
U.S. Cl. D18—44



316,427
WRITING IMPLEMENT
Bernhard Tinz, Brunnwiesen 43 d, 7000 Stuttgart 75, BRD, Fed. Rep. of Germany
Filed Jul. 18, 1988, Ser. No. 220,845
Term of patent 14 years
U.S. Cl. D19—48

316,428
HEADER FOR A NEWSPAPER VENDING BIN OR SIMILAR ARTICLE
Milton J. Meri, New City, N.Y., assignor to Gannett Co., Inc., Arlington, Va.
Filed Aug. 14, 1987, Ser. No. 85,415
Term of patent 14 years
U.S. Cl. D20—8

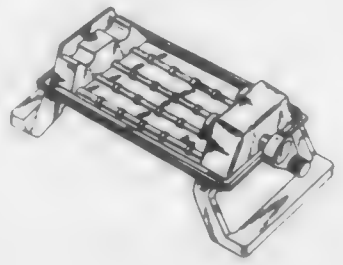
316,429
SIGN
David S. Gutierrez, 14771 Harper, Midway City, Calif. 92655
Filed Apr. 3, 1989, Ser. No. 332,105
Term of patent 14 years
U.S. Cl. D20—42



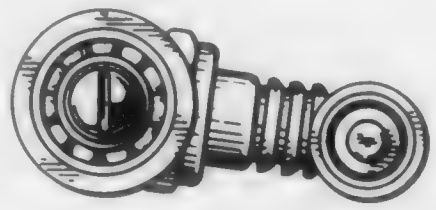
316,430
TOY BUILDING ELEMENT
Edel S. Andersen, Randbol, Denmark, assignor to Interlego AG, Baar, Switzerland
Filed May 9, 1989, Ser. No. 349,341
Term of patent 14 years
U.S. Cl. D21—108

316,431
TOY POLAR BEAR
Christian Stephensen, Marstal, and Jacob Nielsen, Copenhagens, both of Denmark, assignors to Interlego A.G., Baar, Switzerland
Filed Nov. 29, 1989, Ser. No. 443,224
Term of patent 14 years
U.S. Cl. D21—108

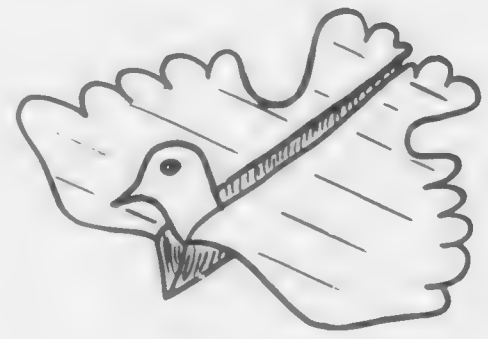
316,432
TOY LION
Christian Stephenson, Marstal, and Jacob Nielsen, Copenhagen S, both of Denmark, assignors to Interlego A.G., Baar, Switzerland
Filed Nov. 29, 1989, Ser. No. 443,226
Term of patent 14 years
U.S. Cl. D21—108



316,433
TOY GIRAFFE
Christian Stephensen, Marstal, and Jacob Nielsen, Copenhagens, both of Denmark, assignors to Interlego A.G., Baar, Switzerland
Filed Nov. 29, 1989, Ser. No. 443,228
Term of patent 14 years
U.S. Cl. D21—108



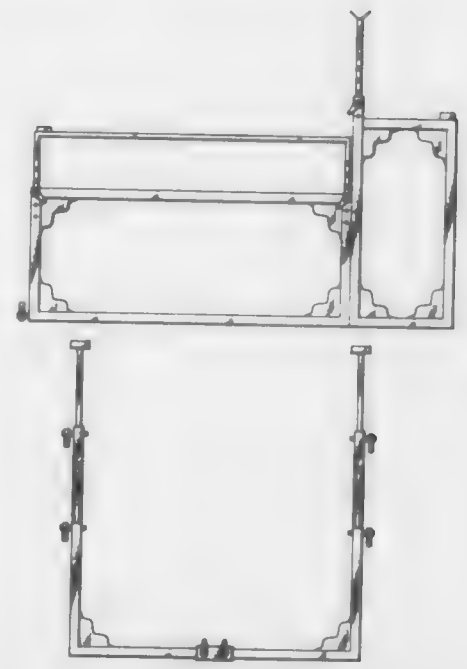
316,434
TOY TIGER
Christian Stephensen, Marstal, and Jacob Nielsen, Copenhagen S, both of Denmark, assignors to Interlego A.G., Baar, Switzerland
Filed Nov. 29, 1989, Ser. No. 443,229
Term of patent 14 years
U.S. Cl. D21—108



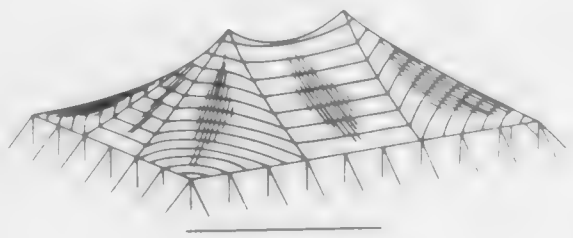
316,435
TOY COOKING GRILL
Janet E. Snell-Kelly, East Aurora, N.Y., assignor to The Quaker Oats Company, Chicago, Ill.
Filed Aug. 15, 1988, Ser. No. 232,583
Term of patent 14 years
U.S. Cl. D21—122

316,436
SPARKPLUG TOY CAR
Victor E. Franzone, 36 R.D. #2, Mertztown, Pa. 19539
Filed May 22, 1989, Ser. No. 354,938
Term of patent 14 years
U.S. Cl. D21—128

316,437
TOY BIRD
Jeffrey L. Peyton, P.O. Box C-32000, Richmond, Va. 23261-2000
Filed Jun. 2, 1987, Ser. No. 57,244
Term of patent 14 years
U.S. Cl. D21—160

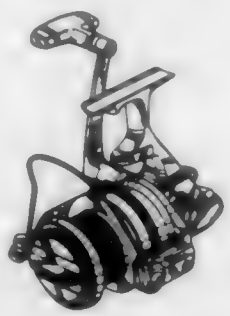


316,438
DOLL
Jerrie Waine, 121-E Crabapple La., Birmingham, Ala. 35214
Filed Sep. 26, 1988, Ser. No. 249,169
Term of patent 14 years
U.S. Cl. D21—171

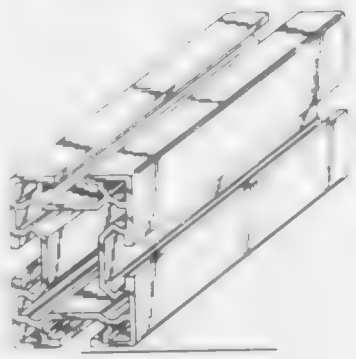


316,439
COMBINED STUFFED TOY AND TRANSPARENT CONTAINER THEREFOR
Richard C. Arginsky, Ellenville, N.Y., assignor to The Plush Factory Inc., Ellenville, N.Y.
Filed Jan. 11, 1988, Ser. No. 142,847
Term of patent 14 years
U.S. Cl. D21—159

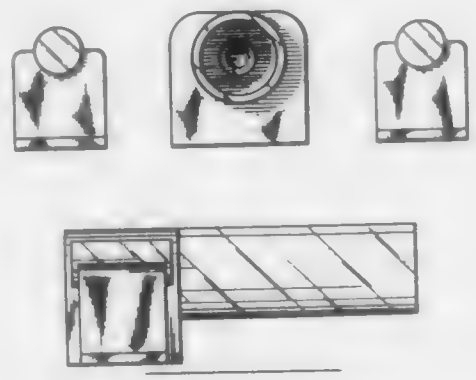
316,440
FREE WEIGHT SAFETY RACK
Mark E. Ekern, 207 N. Prarie, Flandreau, S. Dak. 57028
Filed Dec. 6, 1988, Ser. No. 280,522
Term of patent 14 years
U.S. Cl. D21—191



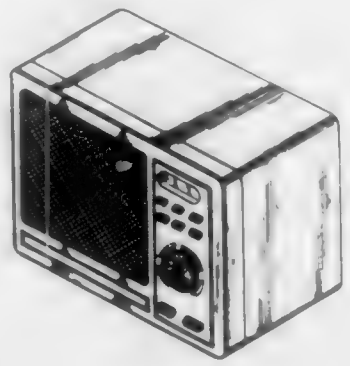
316,441
TENT
Todd Dalland, 110 Reade St., New York, N.Y. 10013
Division of Ser. No. 30,912, Mar. 26, 1987, Pat. No. D. 307,311. This application Feb. 5, 1990, Ser. No. 475,430
Term of patent 14 years
U.S. Cl. D21—253



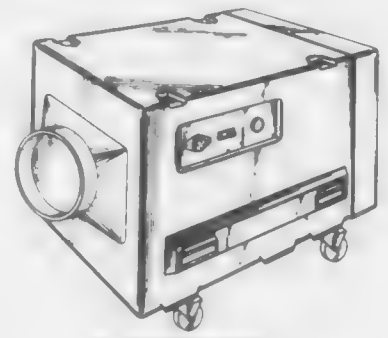
316,442
GUN
Thierry Guidat; Alain Lechelle, both of Mulhouse; Marc Renard, Pierrefitte, and Jean P. Puel, Puteaux, all of France, assignors to Matra Manurhin Defense, Velizy Villacoublay, France
Filed Apr. 6, 1988, Ser. No. 178,287
Term of patent 14 years
U.S. Cl. D22—104



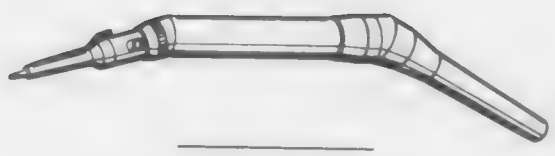
316,443
FISHING REEL
Toshiaki Yoshikawa, and Akihisa Shiozaki, both of Musashino, Japan, assignors to Daiwa Seiko, Inc., Tokyo, Japan
Filed Dec. 19, 1988, Ser. No. 285,954
Claims priority, application Japan, Jun. 20, 1988, 63-24465
Term of patent 14 years
U.S. Cl. D22—141



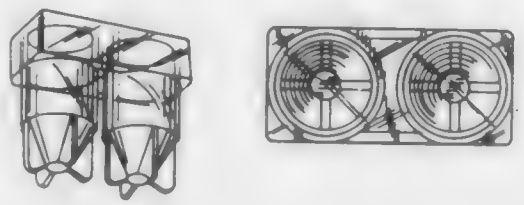
316,444
BEAM
Goran Abbestam, Landerigatan 2, S-416 70 Goteborg, and Leif Lachoulus, Utsiktsliden 5, S-445 00 Surte, both of Sweden
Division of Ser. No. 368,527, Jun. 20, 1989. This application Jul. 26, 1990, Ser. No. 558,191
Claims priority, application Sweden, Dec. 21, 1988, 882944
Term of patent 14 years
U.S. Cl. D25—122



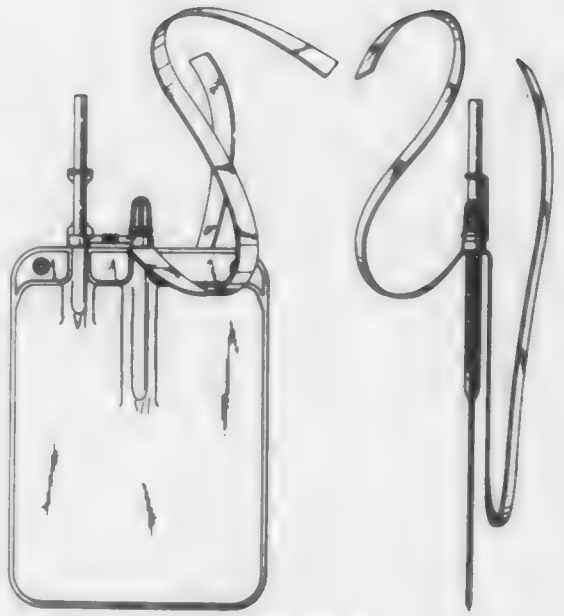
316,445
FAUCET SET
Regina Razumov, San Diego, Calif., assignor to Harden Industries, Inc., Los Angeles, Calif.
Filed May 11, 1988, Ser. No. 192,505
Term of patent 14 years
U.S. Cl. D23—242



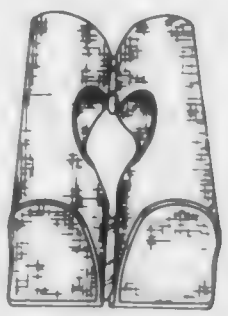
316,446
ELECTRIC HEATER
Wen T. Lee, Tainan, Taiwan, assignor to Caho-Yang Electric Mgf. Co., Ltd., Tainan, Taiwan
Filed Mar. 10, 1989, Ser. No. 321,336
Term of patent 14 years
U.S. Cl. D23—335



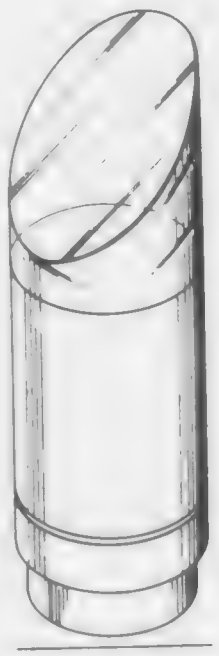
316,447
NEGATIVE PRESSURE AIR FILTRATION HOUSING
James C. Woodson; Ron W. Mumford, and Kenneth S. Kondo, all of Houston, Tex., assignors to Critical Industries, Inc., Houston, Tex.
Filed Sep. 19, 1989, Ser. No. 408,800
Term of patent 14 years
U.S. Cl. D23—365



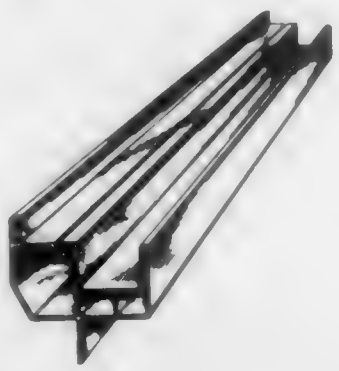
316,448
ULTRASONIC ASPIRATOR FOR MICROSCOPIC NEUROSURGERY
Masaichi Kijima, Tokyo, and Nobumichi Yajima, Nagano, both of Japan, assignors to Aloka Co., Ltd., Tokyo and Ueda Japan Radio Co., Ltd., Nagano, both of, Japan
Filed Mar. 31, 1988, Ser. No. 176,391
Claims priority, application Japan, Oct. 2, 1987, 62-40561
Term of patent 14 years
U.S. Cl. D24—26



316,449
DUAL RESERVOIR SAMPLE CUP
Michael D'Aquino, Miami, Fla., and Julius Becker, Cincinnati, Ohio, assignors to Baxter International Inc., Deerfield, Ill.
Division of Ser. No. 146,144, Jan. 15, 1988, Pat. No. Des. 309,779. This application May 14, 1990, Ser. No. 506,327
Term of patent 14 years
U.S. Cl. D24—29

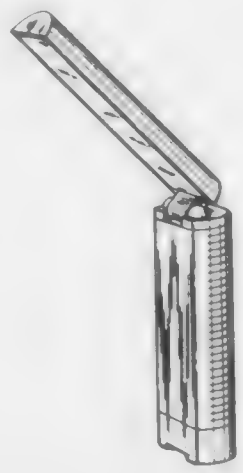


316,450
SURGICAL DRAINAGE CONTAINER
Kevin R. Baber, Folkestone, England, assignor to Smiths Industries Public Limited Company, London, England
Filed May 25, 1988, Ser. No. 198,819
Claims priority, application United Kingdom, Dec. 10, 1987, 1046997
Term of patent 14 years
U.S. Cl. D24—58

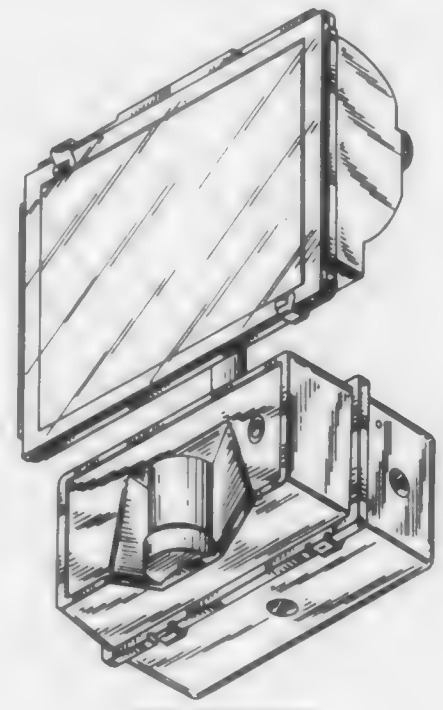


316,451
FOLDABLE CHIROPRACTIC PILLOW
Alan B. Carnathan, and Susan G. Carnathan, both of Edgemont, Ark., assignors to Slack, Inc., Greers Ferry, Ark.
Filed Mar. 14, 1988, Ser. No. 167,432
Term of patent 14 years
U.S. Cl. D24—64

316,452
OUTDOOR BOLLARD LIGHTING FIXTURE
Hiroshi Kira, Westlake Village, Calif., assignor to Lumiere Design and Manufacturing, Inc., Westlake, Calif.
Filed Oct. 13, 1989, Ser. No. 421,394
Term of patent 14 years
U.S. Cl. D26—68

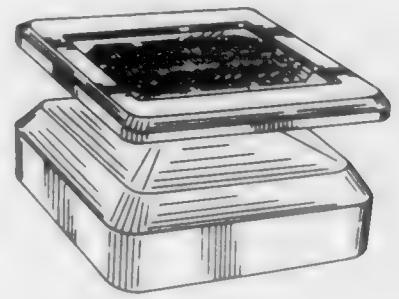


316,453
WINDOW COMPONENT EXTRUSION
Dennis Westphal, Galva, and Jonathan Piles, McPherson, both of Kans., assignors to CertainTeed Corporation, Valley Forge, Pa.
Filed Sep. 12, 1989, Ser. No. 406,112
The portion of the term of this patent subsequent to May 15, 2004, has been disclaimed.
Term of patent 14 years
U.S. Cl. D25—122

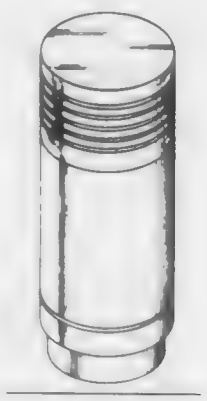


316,454
BATTERY OPERATED LIGHT FOR A HANDHELD COMPUTER GAME MACHINE SCREEN
Angelo Tortola, Lexington, and Robert Howitt, Leominster, both of Mass., assignors to Curtis Manufacturing Company, Inc., Jaffrey, N.H.
Filed Jun. 18, 1990, Ser. No. 540,501
Term of patent 14 years
U.S. Cl. D26—24

316,455
TORCH
Leonardus A. C. Krol, Gorinchem, Netherlands, assignor to U.S. Philips Corporation, New York, N.Y.
Filed Oct. 3, 1988, Ser. No. 253,285
Claims priority, application United Kingdom, Apr. 13, 1[illegible] 1049931
Term of patent 14 years
U.S. Cl. D26—44

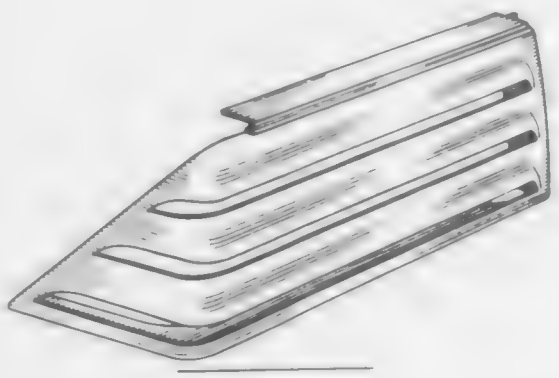


316,456
COMBINED OUTDOOR FLOODLIGHT AND PHOTO ELECTRIC CONTROL THEREFOR
Giovanni De Candia, Germantown, Tenn., assignor to FL Industries, Inc., Livingston, N.J.
Filed Feb. 1, 1988, Ser. No. 151,244
Term of patent 14 years
U.S. Cl. D26—63



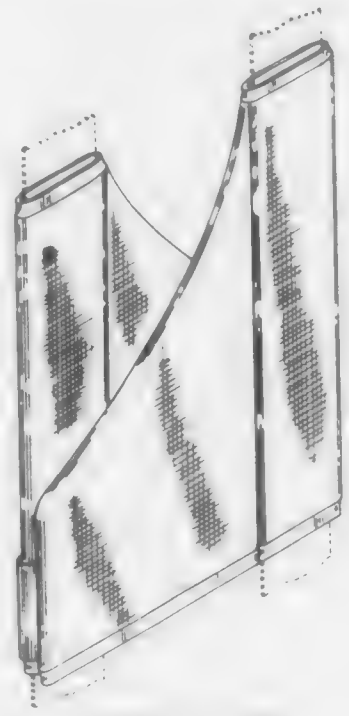
316,457
POST LANTERN OR THE LIKE
Robert De'Armond, Louisville, Ky., assignor to Thomas Industries Inc., Louisville, Ky.
Filed Jul. 6, 1987, Ser. No. 69,952
Term of patent 14 years
U.S. Cl. D26—67

316,458
SOLAR POWERED OUTDOOR RECREATIONAL LAMP
James C. Spotts, Kowloon, and Haw R. Chai, Des Voeux, both of Hong Kong, assignors to Australux North America, Ltd., Hong Kong
Filed Oct. 3, 1989, Ser. No. 416,444
Term of patent 14 years
U.S. Cl. D26—67



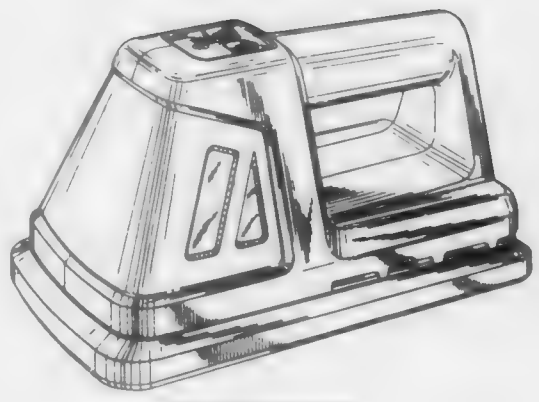
316,459
OUTDOOR BOLLARD LIGHTING FIXTURE
Hiroshi Kira, Westlake Village, Calif., assignor to Lumiere Design and Manufacturing, Inc., Westlake, Calif.
Filed Oct. 13, 1989, Ser. No. 421,395
Term of patent 14 years
U.S. Cl. D26—68

316,460
SHIELD FOR PROTECTING A TRUCK DRIVING LIGHT FROM ROAD DAMAGE
Roy M. Neece, Rte. 9, Box 289V, Saginaw, Tex. 76179
Filed Aug. 30, 1988, Ser. No. 238,160
Term of patent 14 years
U.S. Cl. D26—139

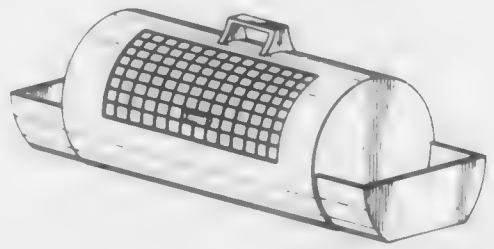


316,461
PAIR OF LOUVERED TAIL LIGHT COVERS
Gregory A. McGlothlin, 625 Grand Mesa Ave., Grand Junction, Colo. 81503
Filed Oct. 14, 1988, Ser. No. 257,797
Term of patent 14 years
U.S. Cl. D26—139

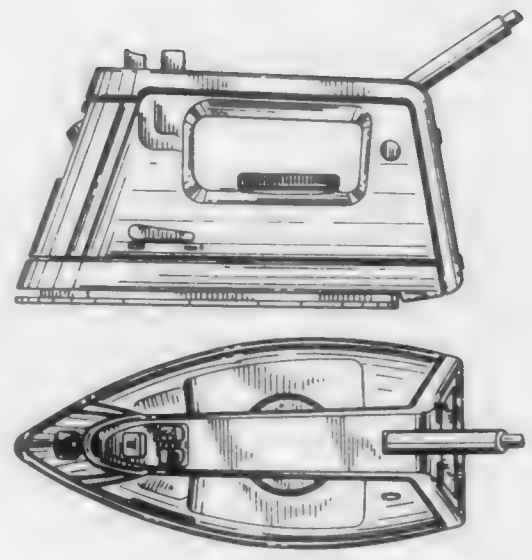
316,462
COSMETIC COMPACT
Frederico Restrepo, Paris, France, assignor to Societe D'Hygiene Dermatologique de Vichy, Vichy, France
Filed Feb. 27, 1989, Ser. No. 316,445
Claims priority, application Int'l Pat. Institute, Sep. 2, 1988, DM/01167,3
Term of patent 14 years
U.S. Cl. D28—83



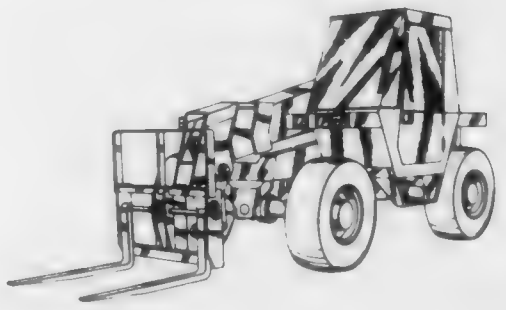
316,463
CHEST RESTRAINT FOR SHOULDER HARNESS
Michael R. Gravel, Little Falls, N.Y., assignor to Tumble Forms, Inc., Dolgeville, N.Y.
Filed Apr. 4, 1988, Ser. No. 176,981
Term of patent 14 years
U.S. Cl. D29—10



316,464
PET CUSHION
Peggy E. Kelley, 8202 Artic Kemp Rd., Frederick, Md. 21701
Filed Sep. 13, 1988, Ser. No. 243,775
Term of patent 14 years
U.S. Cl. D30—118

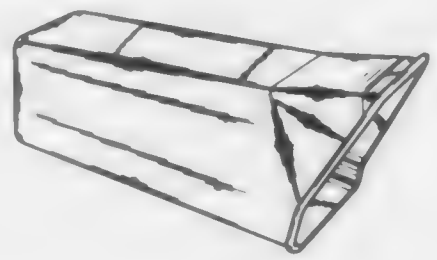


316,465
STEAM GENERATING MACHINE
Ulrich Reiferscheid, Ravensburg, Fed. Rep. of Germany, and Robin H. Spratt, Tyne & Wear, England, assignors to Black & Decker Inc., Newark, Del.
Continuation-in-part of Ser. No. 174,318, Mar. 25, 1988, abandoned. This application Oct. 17, 1988, Ser. No. 258,694
Claims priority, application United Kingdom, Sep. 28, 1987, 1045199; Apr. 26, 1988, 1050273
Term of patent 14 years
U.S. Cl. D32—17

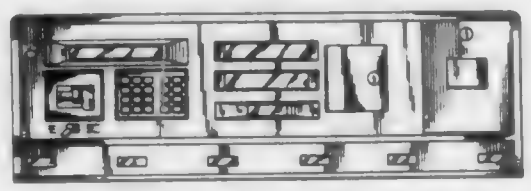


316,466
LAUNDRY CONTAINER
Michael J. Veasey, 15215 Threech La., Webster, Tex. 77059
Filed Aug. 24, 1988, Ser. No. 235,646
Term of patent 14 years
U.S. Cl. D32—37

316,467
IRON
Lung W. Choi, Kowloon, Hong Kong, assignor to Goodway Electrical Co., Ltd., Kowloon, Hong Kong
Filed Sep. 6, 1989, Ser. No. 402,855
Claims priority, application United Kingdom, Mar. 10, 1989, 1057762
Term of patent 14 years
U.S. Cl. D32—70



316,468
TELESCOPIC MATERIAL HANDLING VEHICLE
Dale D. Sandrock, Pekin, Ill.; Stephen H. Gill, Mentor; Llewellyn L. Walter, Chardon, both of Ohio; David P. Brown, Osmotherly, and James Wilson, Sunderland, both of United Kingdom, assignors to Caterpillar Industrial Inc., Mentor, Ohio
Filed Apr. 29, 1988, Ser. No. 187,784
Term of patent 14 years
U.S. Cl. D34—37



316,469
GRAVE MARKER
Armando Zapata, Box 428, Rosharon, Tex. 77583
Filed Jun. 22, 1988, Ser. No. 210,285
Term of patent 14 years
U.S. Cl. D99—18

316,470
NEWSPAPER BOX
Carl D. Fuemmeler, 1809 S. Morris, Mexico, Mo. 65265
Filed Jun. 10, 1987, Ser. No. 60,371
Term of patent 14 years
U.S. Cl. D99—29

316,471
CREDIT AND DEBIT AUTHORIZATION PANEL OR SIMILAR ARTICLE
Donald P. Austin, Jamestown; Albert L. Lawrence, Thomasville, and Arthur C. Prewitt, Julian, all of N.C., assignors to Gilbarco Inc., Greensboro, N.C.
Filed Jun. 24, 1988, Ser. No. 210,779
Term of patent 14 years
U.S. Cl. D99—43

LIST OF PATENTEES

TO WHOM

PATENTS WERE ISSUED ON THE 23RD DAY OF APRIL, 1991

NOTE.—Arranged in accordance with the first significant character or word of the name (in accordance with city and telephone directory practice)

A S Ferrosan *See*—
Braestrup, Claus T., Nielsen, Mogens C., Christensen, Joergen A., Engelstoft, Mogens, Schou, Henning, Eder, Ulrich, Neef, Gunter; Huth, Andreas, Rahtz, Dieter, and Schmiechen, Ralph, 5,010,077, Cl. 514-228.800.

A Stucki Company Division of Hansen, Inc *See*—
Wiebe, Donald, 5,009,521, Cl. 384-191.100

Abb, Thomas *See*—
Sacco, Bruno, Tomforde, Johann, Abb, Thomas, and Stengmann, Bruno, 5,009,042, Cl. 52-36.000

Abbott Laboratories *See*—
Brinker, Dale R., and Reiland, Thomas L., 5,009,897, Cl. 424-469.000

Abe, Akira, to Fuji Photo Film Co., Ltd. Method for processing silver halide photosensitive materials. 5,009,983, Cl. 430-372.000

Abe, Nobuyuki *See*—
Hasegawa, Takanori, Abe, Nobuyuki, Hibara, Toru, Hirose, Toshihiko, Kanda, Takashi, Saito, Hiroshi, Oshima, Masaki, and Nakazawa, Eiji, 5,010,420, Cl. 358-471.000

Abe, Ryoji, Okita, Junichi, Miyagoshi, Katsunobu, and Hashiyama, Kouichi, to Mazda Motor Corporation. Crankshaft supporting structure for an internal combustion engine. 5,009,205, Cl. 123-195.00H

Abe, Shigenobu *See*—
Hayashi, Yasuyuki, and Abe, Shigenobu, 5,009,451, Cl. 280-724.000

Abou-Gharbia, Magid A., Yardley, John P., and Childers, Wayne E., Jr., to American Home Products Corporation. Aryl- and heteroaryl piperazinyl carboxamides having central nervous system activity. 5,010,078, Cl. 514-252.000

Abou-Issa, Hussein M.: *See*—
Minton, John P., Webb, Thomas E., and Abou-Issa, Hussein M., 5,010,107, Cl. 514-578.000

Abraham, Martin J., III. System for cooling beer for remote dispensing. 5,009,082, Cl. 62-390.000

Abu-Isa, Ismat A., Eusebi, Elio, Jaynes, Craig B., Moran, Susan C., and Roy, Michael A., to General Motors Corporation. Process for forming an elastomeric membrane. 5,009,827, Cl. 264-156.000.

Abu-Isa, Ismat A., to General Motors Corporation. Dual modulus oriented elastomeric filaments. 5,009,955, Cl. 428-401.000

Acrymet Industries Inc.: *See*—
Paul, Stanley, 5,009,048, Cl. 52-308.000

Adanlock: *See*—
Roller, Timothy J.; and Thiele, Robert E., 5,009,470, Cl. 312-325.000

ADC Telecommunications, Inc *See*—
Werdin, David A., and Henke, Reinhold, 5,010,450, Cl. 361-415.000

Adelson, Edward H *See*—
Schreiber, William F., Lippman, Andrew B., Adelson, Edward H., and Netravali, Aran N., 5,010,405, Cl. 358-141.000

Adler, Robert *See*—
Petrik, Michael A., Adler, Robert J., and Wineland, Jonathan D., 5,009,796, Cl. 210-787.000

Adler, Robert J *See*—
Petrik, Michael A., Adler, Robert J., and Wineland, Jonathan D., 5,009,796, Cl. 210-787.000

Advance Display Technologies, Inc *See*—
Knudson, Steven B., 5,009,475, Cl. 350-96.100

Advanced Energy Industries, Inc *See*—
Siefkes, Jerry D.; Harpold, John G., and Schatz, Douglas S., 5,009,764, Cl. 204-298.080

Advanced Environmental Research Group *See*—
Gerritsen, Hendrik J., 5,009,484, Cl. 350-162.110

Advanced Micro Devices, Inc *See*—
Allen, Bert L., Gwozdz, Peter S., and Bowers, Thomas R., 5,010,024, Cl. 437-24.000
Itoh, Tatsuo, 5,010,561, Cl. 377-47.000
Liu, Yow-Juang (Bill); and Hadjizadeh-Amini, Zahra, 5,010,029, Cl. 437-44.000

Advanced Technologies Management, Inc *See*—
Hise, Ralph E., 5,009,763, Cl. 204-255.000

AE PLC: *See*—
Beaurepaire, Olivier, and Thompson, Frederick H., 5,009,124, Cl. 74-595.000

AEG Westinghouse Transportation Systems, Inc *See*—
Karg, Kenneth A.; Hvozda, Carl K., Neddermeyer, Robert N., and Feld, Alexander, 5,009,148, Cl. 98-10.000

Aeolian Partnership *See*—
Smith, Raoul D., 5,009,571, Cl. 416-79.000

Aerolux Produktions- und Handelsgesellschaft mbH *See*—
Miloslaus, Ludwig, 5,009,259, Cl. 160-323.100

Afromowitz, Martin A., to University of Washington, Board of Regents of the. Method of monitoring solidification of a liquid composition. 5,009,102, Cl. 73-590.000

Agency of Industrial Science & Technology *See*—
Kosugi, Yoshitsugu, Tanaka, Hideoki, Suzuki, Hideo, and Shiraki, Masaru, 5,010,004, Cl. 435-134.000

Agfa Gevaert Aktiengesellschaft *See*—
Grigat, Ernst; Meckel, Walter, and Nippe, Burkhard, 5,009,925, Cl. 427-48.000
Kunitz, Friedrich-Wilhelm, and Wichmann, Ralf, 5,009,985, Cl. 430-430.000
Scheerer, Rainer, and Moll, Franz, 5,009,990, Cl. 430-539.000

Agfa-Gevaert, N.V. *See*—
De Rycke, Gino L., Rutges, Antonius A., and De Prijcker, Jozef P., 5,009,984, Cl. 430-404.000
Nys, Pierre H., Vinck, Paul W., and von Erdmannsdorff, Andreas, 5,010,398, Cl. 358-80.000

Agip Petroli S.p.A.: *See*—
Brandolese, Ernesto, 5,009,803, Cl. 252-49.500

Agnew, Marc N *See*—
Allen, Richard C., Agnew, Marc N., and Fink, David M., 5,010,083, Cl. 514-292.000

Agri-Tech Incorporated *See*—
Chance, Lynn C., and Low, John A., 5,009,307, Cl. 198-538.000

Ahmad, Jameel, and Valenza, Joseph P., to High Technologies, Inc. Reinforced asphalt concrete and structure for producing same. 5,009,543, Cl. 404-70.000

Ahmad, Mohammad R., and Barke, Oscar A., to Floss Products Corporation. Dentifrice. 5,009,886, Cl. 424-58.000

Ahmed, Hassan J., to Westinghouse Electric Corp. Nuclear fuel rod helium leak inspection apparatus and method. 5,009,835, Cl. 376-251.000.

Ahmed, Salah H., and Luksas, Anthony J., to Dairy Research, Inc. Cheese-like spread composition and method of making. 5,009,913, Cl. 426-581.000

Aichi Steel Works, Ltd *See*—
Sugimoto, Atsushi, Nakano, Osamu, Yasuda, Shigeru, Maeda, Chikatoshi, Ozone, Toshio, and Kawagoe, Makoto, 5,009,843, Cl. 420-112.000.

Aichi Steel Works, Ltd *See*—
Honkura, Yoshinobu, Matsuo, Toru, and Murata, Kouji, 5,009,723, Cl. 148-12.00E

Aikoh Co., Ltd. *See*—
Iwahashi, Takashi, 5,009,887, Cl. 424-76.100

Air Products and Chemicals, Inc *See*—
Angus, Richard O., and Yaeoub, Kahlil, 5,009,679, Cl. 55-16.000
Ellison, Thomas L., Roberts, David A.; Ivankovits, John C., and Norman, John A. T., 5,009,725, Cl. 148-23.000
Famili, Amir F., Marten, F. Lennart, and Mohanty, Dillip K., 5,010,153, Cl. 526-243.000.

Aisan Kogyo Kabushiki Kaisha: *See*—
Hanai, Kazumichi; Mine, Koichi, and Kikuta, Hikaru, 5,009,575, Cl. 417-244.000

Aisin-AW Kabushiki Kaisha: *See*—
Harada, Kyouji, Kato, Eiji, Sakaguchi, Yoshikazu, Watanabe, Suzuaki; and Hoshino, Akira, 5,009,290, Cl. 188-71.500.

Aisin Seiki K.K.: *See*—
Sumi, Chiaki; and Kuwayama, Wataru, 5,010,212, Cl. 174-52.200.

Aisin Seiki Kabushiki Kaisha *See*—
Kuki, Nobuyuki; Isomura, Yukio, Suzumura, Hirokazu; Sakakibara, Yoshikazu, and Ishihara, Hiroshi, 5,009,035, Cl. 49-352.000

Akana, Yoshinori *See*—
Kohsaka, Masaki, Higashi, Isaburou, Akana, Yoshinori; Hashimoto, Mikio; and Yatsu, Tadao, 5,010,146, Cl. 525-439.000

Akazawa, Hiroyuki, and Imae, Toshihiro, to Seiko Epson Corporation. Paper feeding apparatus for accommodating different lengths of recording media for use with a printer. 5,009,532, Cl. 400-636.200

Akazawa, Hitoshi *See*—
Sasame, Akira, Sakanoue, Hitoyuki, Takeuchi, Hisao; Miyake, Masaya, Yamakawa, Akira; Yushio, Yasuhisa, and Akazawa, Hitoshi, 5,010,388, Cl. 357-70.000

Akebono Brake Industry Co., Ltd *See*—
Takahashi, Nobuyuki, 5,009,293, Cl. 188-72.400.

Akebono Research and Development Centre Ltd.: *See*—
Takahashi, Nobuyuki, 5,009,293, Cl. 188-72.400.

Aker Engineering a.s. *See*—
Brekke, Kristian, 5,009,680, Cl. 55-40.000

Akiyama, Masakazu *See*—
Mori, Kinji, Kunai, Yuko, Akiyama, Masakazu, Kadoya, Tadaaki, Kawano, Katsumi, Miyamoto, Shoji, Nohmi, Makoto, Shingai, Sadanori, and Ihara, Hirokazu, 5,010,479, Cl. 364-200.000

Akizawa, Nobuyuki, Kudo, Yasunori, Kanai, Toshiyuki, Kamei, Yasuo, Oyama, Nobuaki, and Negishi, Akihito, to Max Co., Ltd. Electric stapler 5,009,355, Cl. 227-114.000

Akva A/S *See*—
Molaug, Ole, and Risa, Steinar, 5,009,908, Cl. 426-454.000

Akzo N.V. *See*—
Becker, John W., 5,009,896, Cl. 424-467.000
Roos, Antonius, 5,009,829, Cl. 264-210.600
Sikkema, Doetze J., 5,010,168, Cl. 528-338.000

Albar *See*—
Bobry, Howard H., 5,010,469, Cl. 363-37.000

Alberta Energy Company Ltd. *See*—
Schramm, Laurier L., and Smith, Russell G., 5,009,773, Cl. 208-391.000

Albino, Anthony, Lloyd, Kenneth, Ikeda, Hisami, and Old, Lloyd, to Sloan-Kettering Institute for Cancer Research. Monoclonal antibodies to melanoma cells. 5,009,995, Cl. 435-7.230

Albinson, Rosemary B., to XAAR Limited. Method of forming an adherent fluorosilane layer on a substrate and ink jet recording head containing such a layer. 5,010,356, Cl. 346-140.00R

Alcan International Limited *See*—
Apte, Prasad S., and Pant, Aniket, 5,010,220, Cl. 219-10.55M

Alcatel Cit *See*—
Jacob, Jean-Baptiste, 5,010,545, Cl. 370-56.000

Alcatel Espace *See*—
Rene, Didier, Dusseux, Thierry, and Ginestet, Philippe, 5,010,348, Cl. 343-700.0MS

Alestrom, Peter *See*—
Gautvik, Kaare M., Alestrom, Peter, Oven, Tordis B., and Gabrielsen, Odd S., 5,010,010, Cl. 435-252.300

Alfa Wasserman S.p.A. *See*—
Piani, Silvano, Tamagnone, Gianfranco, Alpino, Raul R., Milani, Maria R., and Fantuz, Marinella, 5,010,063, Cl. 514-56.000

Alferness, Rodney C., Budnikis, Zigmantas L., Hagelbarger, David W., Kogelnik, Herwig W., and Netravali, Arun N., to AT&T Bell Laboratories. Optical interconnect arrangement. 5,009,477, Cl. 350-96.150

Allen, Bert L., Gwozdz, Peter S., and Bowers, Thomas R., to Advanced Micro Devices, Inc. Passivation for integrated circuit structures. 5,010,024, Cl. 437-24.000

Allen, Ernie L. *See*—
Johnson, Harlan B., Wiedrich, Charles R., Allen, Ernie L., and Howell, Peter P., 5,009,806, Cl. 252-187.280

Allen, Richard C., Agnew, Marc N., and Fink, David M., to Hoechst-Roussel Pharmaceuticals, Inc. 2,6-methano-1,3-benzodiazocine compounds which have useful pharmaceutical utility. 5,010,083, Cl. 514-292.000

Allen, Tate C. Aquatic amusement device. 5,009,413, Cl. 272-1.00B

Allenson, Stephan J. *See*—
Williamson, Charles D., Allenson, Stephan J., and Gabel, Robert K., 5,009,267, Cl. 166-271.000

Allied-Signal Inc. *See*—
Banik, Anthony, 5,009,704, Cl. 75-238.000
Baughman, Ray H., Buff, Ernest D., Eckhardt, Helmut, and Fuchs, Gerhard H., 5,009,044, Cl. 52-171.000
Damgaard-Iversen, Karsten, Morris, Robert C., Chin, Timothy C., and Kuper, Jerry W., 5,009,658, Cl. 606-128.000

Alpha Industries, Inc. *See*—
Nolan, John H., and Skvarce, Dennis H., 5,009,140, Cl. 83-698.000

Alpine Electronics Inc. *See*—
Kobari, Tadaomi, 5,010,448, Cl. 361-403.000

Alpino, Raul R. *See*—
Piani, Silvano, Tamagnone, Gianfranco, Alpino, Raul R., Milani, Maria R., and Fantuz, Marinella, 5,010,063, Cl. 514-56.000

Alps, Brian J. *See*—
Pascal, Jean C., Lee, Chi-Ho, Alps, Brian J., Pinhas, Henri, and Whiting, Roger L., 5,010,075, Cl. 514-218.000

Alps Electric Co., Ltd. *See*—
Hatanaka, Sunao, 5,010,365, Cl. 355-211.000
Kato, Takafumi, 5,010,219, Cl. 200-408.000

Alquist, John W., to Lake Shore, Inc. Cable tensioning device. 5,009,353, Cl. 226-172.000

Alt, Eckhard. For the thermodilution method of determining cardiac output. 5,009,234, Cl. 128-672.000

Alting, Cornelis L. *See*—
Haisma, Jan, Alting, Cornelis L., and Michielsen, Theodorus M., 5,009,689, Cl. 65-33.000

Alto, Brian J., and Alto, Gregory F. Roof shingle stripper apparatus. 5,009,131, Cl. 81-45.000

Alto, Gregory F. *See*—
Alto, Brian J., and Alto, Gregory F., 5,009,131, Cl. 81-45.000

Ameda AG *See*—
Riedweg, Robert; and Schlensog, Klaus, 5,009,638, Cl. 604-74.000

Amemiya, Koji *See*—
Takeuchi, Tatsuo, and Amemiya, Koji, 5,009,945, Cl. 428-76.000

American Cyanamid Company *See*—
Brady, Thomas E., Condon, Michael E., and Marc, Pierre A., 5,009,699, Cl. 71-92.000
Brown, Dale G., Siddens, Jack K., Diehl, Robert E., and Wright, Donald P., Jr., 5,010,098, Cl. 514-426.000

American Home Products Corporation *See*—
Abou-Gharbia, Magid A., Yardley, John P., and Childers, Wayne E., Jr., 5,010,078, Cl. 514-252.000
Felman, Steven W., Jirkovsky, Ivo L., and Memoli, Kevin A., 5,010,102, Cl. 514-473.000

American Language Academy *See*—
Willetts, John A., 5,010,495, Cl. 364-513.500

American Maize-Products Company *See*—
Mauro, David J., Furcsik, Susan L., Katz, Frances R., Faron, Eugene J., II, Gottneid, David J., and Pustek, Frank J., 5,009,911, Cl. 426-578.000

American Standard Inc. *See*—
Cocciadiferro, Michael J., and De Serio, Robert J., 5,009,059, Cl. 53-472.000
Okoren, Ronald W., 5,009,075, Cl. 62-127.000

Ames, Wilbur R., IV *See*—
Eilert, Randall N., Neel, Robert M., Harvey, N. Thatcher, Ames, Wilbur R., IV, and Lord, Randall D., 5,008,974, Cl. 16-114.00R

Ametani, Minoru, Funakoshi, Keigo, Kira, Akihiko, Matsushita, Takao and Shirakura, Keizo, to Nitto Denko Corporation. Process for peeling protective film off a wafer. 5,009,735, Cl. 156-241.000

Amoco Corporation *See*—
Clark, Frederick T., Hensley, Albert L., Jr., Lyzinski, David, and Peck, Lawrence B., 5,009,771, Cl. 208-216.0PP
Miller, Jeffrey T., and Hensley, Albert L., Jr., 5,009,770, Cl. 208-209.000
Park, Chang M., 5,010,207, Cl. 549-245.000

AMP Incorporated *See*—
Correll, Robert S., Jr., and Wiltraut, David D., 5,008,999, Cl. 29-882.000
Fogg, Michael W., Koegel, Keith S., Shuey, John R., Zelko, William E., and Beamenderfer, Robert E., 5,009,614, Cl. 439-497.000
Fogg, Michael W., and Morningstar, Leroy J., 5,009,616, Cl. 439-608.000
Henschen, Homer E., McKee, Michael J., and Pawlikowski, Joseph M., 5,010,233, Cl. 219-209.000
Shipe, Joanne E., 5,009,608, Cl. 439-331.000

Ampex Corporation *See*—
Trytko, David E., 5,010,407, Cl. 358-183.000

Analog Devices, Incorporated *See*—
Babcock, Douglas W., 5,010,297, Cl. 324-158.00R
Hisano, Shinichi, Ganesan, Apparajan, and Guy, Thomas S., 5,010,337, Cl. 341-154.000

Anchor Hocking Corporation *See*—
Ochs, Charles S., 5,009,324, Cl. 215-276.000

Andersen, Niels J. to Cabinnovent ApS. Device for the heating or cooling of food-stuffs. 5,009,150, Cl. 99-360.000

Andersen, Peter H. *See*—
Gronwald, Frederik, Andersen, Peter H., Faarup, Peter, Guddal, Erling, Hansen, Kristian T., Hansen, Louis B., and Nielsen, Erik B., 5,010,074, Cl. 514-213.000

Andersson, Henry, to Vaisala Oy. Method and device in the antenna and receiving system of a radio theodolite. 5,010,343, Cl. 342-432.000

Ando, Yasunori *See*—
Ogata, Kiyoshi, Ando, Yasunori, and Kamijo, Eiji, 5,009,923, Cl. 427-38.000

Ando, Yoshihira *See*—
Ueda, Makoto, Ando, Yoshihira, Sakurai, Shungo, and Yoshioka, Ritsuo, 5,009,840, Cl. 376-435.000

Andre, Gerald *See*—
Ergan, Francoise, Trani, Michael, and Andre, Gerald, 5,010,006, Cl. 435-177.000

Andrew Corporation *See*—
Lupkin, Charles I., and Jones, Marianne, 5,010,350, Cl. 343-704.000

Andrews, Claude R. *See*—
Wason, Satish K., Mooney, Gerry, Andrews, Claude R., Tarquini, Michael E., Kosin, John A., and Garcia, Rod A., 5,009,810, Cl. 252-350.000

Angst, Christof *See*—
Herold, Peter, and Angst, Christof, 5,010,189, Cl. 544-174.000

Angus, Richard O., and Yacoub, Kahlil, to Air Products and Chemicals, Inc. Membranes formed from rigid aromatic polyimide polymers. 5,009,679, Cl. 55-16.000

Anthony, Mark C. *See*—
Farrell, Jonathon E., and Anthony, Mark C., 5,010,215, Cl. 200-50.00A

Antonaroli, Simonetta, Bianco, Armandodariano, Brufani, Mario, Lo Baido, Giuseppe, and Rende, Giorgio, to Instituto Chimico Internazionale Dr. Giuseppe Rende S.r.l. Acetazolamide-related compounds, process for their preparation, and pharmaceutical composition containing the same. 5,010,204, Cl. 548-128.000

Antonelli, Joseph A., Scopazzi, Christopher, and Doherty, Mark M., to Du Pont de Nemours, E. I., and Company. Process for preparing stabilized polymer dispersion. 5,010,140, Cl. 525-269.000

Ao, Masahiro *See*—
Taguchi, Akira, Morita, Shigetoshi, Taka, Shunichi, Yamada, Hirohide, Takada, Yoshiaki, Furuichi, Shinji, and Ao, Masahiro, 5,010,429, Cl. 360-103.000

Aoki, Akio *See*—
Enari, Masahiko, Shikichi, Satoshi, Kawaguchi, Fumiaki, Suzuki, Kenichi, Usui, Masayuki, Matsuoka, Hiroshi, Matsuoka, Kazuhiko, Hosoya, Hideki, Aoki, Akio, and Minoura, Kazuo, 5,010,534, Cl. 369-32.000

Aoki, Hiroatsu *See*—
Kinoshita, Kitoshi, and Aoki, Hiroatsu, 5,009,481, Cl. 350-96.186

Aoki, Kozo, and Takahashi, Osamu, to Fuji Photo Film Co., Ltd. Silver halide photographic material. 5,009,989, Cl. 430-512.000

Aoki, Masaaki, Kamiyama, Masayuki, Asai, Kiyotsugu, and Yamaguchi, Akihiro, to Mitsui Toatsu Chemicals, Inc. Polyaldimine derivatives. 5,010,161, Cl. 528-59.000

Application Des Gaz *See*—
Roldan, Antoine, and Demilliere-Vergnais, Daniel, 5,009,592, Cl. 432-222.000

Apte, Prasad S., and Pant, Aniket, to Alcan International Limited. Process and apparatus for heating bodies at high temperature and pressure utilizing microwave energy. 5,010,220, Cl. 219-10.55M

Arai, Kunio; and Kanaya, Yasuhiko, to Hitachi Seiko, Ltd. Method of and apparatus for perforating printed circuit board. 5,010,232, Cl. 219-121.700

Arai, Takeshi, to Sanyo Electric Co., Ltd. Variable speed sound reproducing apparatus for sound reproduction and review system. 5,010,421, Cl. 360-32.000

Arai, Yoshiaki *See*—
Kida, Michio, Arai, Yoshiaki; and Sahira, Kensho, 5,009,862, Cl. 422-249.000.

Arai, Yuji, Shin, Yuaki, Ishiguro, Takashi, and Hamada, Emiko, to Taiyo Yuden Co., Ltd. Method of manufacturing an optical information recorded disc. 5,009,818, Cl. 264-1.003

Arakawa, Yoshiki, to Matsushita Electric Industrial Co., Ltd. Three-dimensional geometry processing method and apparatus therefor. 5,010,501, Cl. 364-522.000

Aratani, Shin-ichi, to Central Glass Company, Limited. Method of bending glass plate. 5,009,671, Cl. 65-106.000

Araya, Junji, Ohzeki, Yukihiro; Miyamoto, Toshio, Hiroshima, Koichi, Sato, Yasushi, and Nakahata, Kimio, to Canon Kabushiki Kaisha. Transfer apparatus and image bearing apparatus using same having transfer means for contacting a backside of a transfer material. 5,010,370, Cl. 355-274.000

Arch Development Corporation *See*—
Maroni, Victor A., 5,010,053, Cl. 505-1.000

Arco Chemical Technology, Inc. *See*—
Schuchardt, Jonathan L., 5,010,047, Cl. 502-24.000

Arditty, Herve, and Lefevre, Hevre, to Thomson-CSF. Monomode optical fiber ring interferometric device with semiconductor diode as light energy emission-reception/amplification means. 5,009,504, Cl. 356-350.000

Arizona Instrument Corp. *See*—
Bell, William E., and McNerney, John J., 5,010,021, Cl. 436-120.000.

Armour, Thomas W., II. Multi-purpose fastening device. 5,008,987, Cl. 24-442.000

Armstrong, Gordon P. *See*—
Pollet, Jean-Claude, Williams, Gary L.; Armstrong, Gordon P., and Miller, David G., 5,009,941, Cl. 428-36.300

Arnold, Edward *See*—
Arnold, Lawrence J., 5,009,135, Cl. 81-488.000

Arnold, Lawrence J., to Arnold, Edward. Brake adjustment tool. 5,009,135, Cl. 81-488.000

Arns, James A. *See*—
Shih, I-Fu, Chang, David B., Arns, James A., Moss, Gaylord E., and Smith, Ronald T., 5,009,502, Cl. 356-152.000

Aronoff, Marvin S., Keyes, Denis E., and Hahn, Robert C., Sr., to E. R. Squibb & Sons, Inc. Starch containing film ostomy pouches. 5,009,648, Cl. 604-332.000

Arora, Sudershan K. *See*—
Ronsen, Bruce, Arora, Sudershan K., and Thomas, Albert V., 5,010,058, Cl. 514-23.000

Arrington, Stephen T., and Bradley, Gary W., to Halliburton Company. Process for removing copper and copper oxide deposits from surfaces. 5,009,714, Cl. 134-2.000

Arthur Guinness Son & Company (Dublin) Limited *See*—
Byrne, William J., 5,009,901, Cl. 426-112.000

Arthur, James C. *See*—
Howe, Michael G., Arthur, James C., and Usleman, Robert T., 5,009,065, Cl. 60-288.000

Arthurs, Raymond C., to Saepter Manufacturing Company Limited. Bottle carrier assembly. 5,009,314, Cl. 206-427.000

Arvidson, Arvid N., Dosaj, Vishu D., and May, James B., to Dow Corning Corporation. Silicon smelting process in direct current furnace. 5,009,703, Cl. 75-10.360

Arvin Industries, Inc. *See*—
Howe, Michael G., Arthur, James C., and Usleman, Robert T., 5,009,065, Cl. 60-288.000

Asahi Glass Company, Ltd. *See*—
Nakanishi, Kazuki, 5,009,688, Cl. 65-18.300

Asahi Kogaku Kogyo Kabushiki Kaisha *See*—
Misawa, Masayuki, 5,010,357, Cl. 354-159.000
Morimoto, Akira, 5,009,472, Cl. 350-6.500

Asahi, Naotatsu *See*—
Iizuka, Nobuyuki, Hirose, Fumiyuki, Asahi, Naotatsu, and Kojima, Yoshitaka, 5,009,070, Cl. 60-753.000

Asai, Hiromitsu *See*—
Takajo, Toshimi, Asai, Hiromitsu, and Haginuma, Kiyoshi, 5,009,520, Cl. 384-100.000

Asai, Kenji, to Kabushiki Kaisha Toshiba. Access controller for controlling the seek operation of a head relative to a recording medium. 5,010,425, Cl. 360-78.040

Asai, Kiyotsugu *See*—
Aoki, Masaaki, Kamiyama, Masayuki, Asai, Kiyotsugu, and Yamaguchi, Akihiro, 5,010,161, Cl. 528-59.000

Asai, Kohtaro *See*—
Murakami, Tokumichi, Asai, Kohtaro; Kamizawa, Koh, Nishida, Masami, Yamazaki, Fizo, Itoh, Atsushi, and Kinjoh, Naoto, 5,010,401, Cl. 358-136.000

Asami, Motomu *See*—
Marutake, Yozo, Fukutome, Tatsuro, and Asami, Motomu, 5,010,575, Cl. 381-68.000

Asano, Masamichi *See*—
Minagawa, Hidenobu, Tatsumi, Yuuichi, Iwahashi, Hiroshi, Asano, Masamichi, Nakai, Hiroto, and Imai, Mizuho, 5,010,520, Cl. 365-174.000.

Asanuma, Masato, and Kaneshige, Masatoshi, to Sharp Kabushiki Kaisha. Developing device with shutter. 5,009,187, Cl. 118-658.000

Asao, Kouichiro *See*—
Ohmae, Tadayuki, Sakurai, Tadashi, and Asao, Kouichiro, 5,009,951, Cl. 428-294.000

Asche, James E., to Clark Equipment Company. Retractable boom stop. 5,009,566, Cl. 414-722.000

Asea Brown Boveri Limited *See*—
Mechtersheimer, Gunter, 5,009,858, Cl. 422-186.190

Ashahi Glass Company, Ltd. *See*—
Harano, Takeshi, Takaki, Satoru, Shigesato, Yuzo, Suzuki, Koichi, Hashimoto, Naoki, Kojima, Hiroyasu, and Oyama, Takuji, 5,009,922, Cl. 427-37.000

Ashland Oil, Inc. *See*—
Yatsuka, Takeshi, Murata, Hiroshi, Mizumura, Yutaka, and Kotera, Nobukazu, 5,009,960, Cl. 428-423.100

Ashlock Company. *See*—
Hirtle, Thomas W., Cimperman, Frederick J., and Silbermann, Klaus, 5,009,909, Cl. 426-481.000

Ashmore, Benjamin H., Jr., to Texas Instruments Incorporated. Integrated-circuit configuration having fast local access time. 5,010,522, Cl. 365-189.070

Astra Meditec Aktiebolag *See*—
Soderberg, Per O., 5,009,596, Cl. 433-173.000

AT&T Bell Laboratories *See*—
Alferness, Rodney C., Budnikis, Zigmantas L., Hagelbarger, David W., Kogelnik, Herwig W., and Netravali, Arun N., 5,009,477, Cl. 350-96.150
Bechtel, Linda K., and Martin, Gary D., 5,010,554, Cl. 371-37.100
Cooke, Paul W., and Taylor, Geoffrey W., 5,010,374, Cl. 357-16.000
Dodd, Courtney V., and Munie, Gregory C., 5,009,724, Cl. 148-23.000
Kutzavitch, Walter G., and Rosenthal, Eugene J., 5,010,306, Cl. 330-284.000
Wang, Robert C., 5,010,574, Cl. 381-42.000

Atkinson, Diane *See*—

Cinquemani, Paul L *See*—
Marciano-Agostinelli, Fabrizio, Barbaro-Forleo, Marco, Marin, Carlo, and Cinquemani, Paul L., 5,010,209, Cl. 174-23.00C
Cislo, Daniel M Modular lockbox and carrying case for pistols, 5,009,088, Cl. 70-63.000
Citadel Investments Limited *See*—
Nickel, Klaus-Dietrich, 5,009,371, Cl. 241-187.000
Clairouin, Noel, Gueroult, Alain, and Lemoyne, Remi, to Nestec S A, Reformed fish products, 5,009,918, Cl. 426-643.000
Clapham, Terrance N., to VISX, Incorporated, Gas purging, eye fixation hand piece, 5,009,660, Cl. 606-166.000
Clapp, Roy A, Process eliminating the use of a master positive film for making a duplicate negative of a color motion picture, 5,010,414, Cl. 358-244.000
Clark Equipment Company *See*—
Asche, James E., 5,009,566, Cl. 414-722.000
Clark, Frank L, Device for relieving ear pain, 5,009,228, Cl. 128-380.000
Clark, Frederick T., Hensley, Albert L., Jr., Lyzinski, David, and Peck, Lawrence B., to Amoco Corporation, Hydroconversion process using mixed catalyst system, 5,009,771, Cl. 208-216.0PP
Clark, Jack P *See*—
Richardson, David L., Clark, Jack P., Kowdley, Balasubramanian S., Patterson, Peter M., Perry, Richard W., and Smith, Thurman D., 5,009,105, Cl. 73-621.000
Clark, Jeff A Water spray for cement finisher, 5,009,547, Cl. 404-112.000
Clarke, Douglas C Pneumatic cylinder with positioning, braking, and feed rate control, 5,009,068, Cl. 60-583.000
Clarke, Neville, and Hansen, Reimer Z., to Conoco Specialty Products Inc, Cyclone separator with oppositely directed separating chambers, 5,009,784, Cl. 210-512.100
Clauss, Julius A *See*—
Ivey, John S., Bateman, Paul M., Clauss, Julius A., Cole, Edward H., Jr., and Mott, Philip J., 5,009,631, Cl. 474-213.000
Clayton, Simon N., Lambert, Peter M., and Wevers, Jean, to Procter & Gamble Company, The, Granular laundry compositions containing multi ingredient components having disparate rates of solubility, 5,009,804, Cl. 252-90.000
Cleary, Terrance M., Donahue, Raymond J., Hesterberg, William G., and Toniello, Lawrence I., to Brunswick Corporation, Vacuum lift foam filled casting system, 5,009,260, Cl. 164-255.000
Clegg, David E *See*—
Chuang, Karl T., McMonagle, James B., Quaiattini, Robert J., Seddon, William A., and Clegg, David E., 5,009,872, Cl. 423-245.300
Cloyd, Willard C., and Nelson, Robert M., to Hexcel Corporation, Method for coating fabric surface with electrically conductive film, 5,009,927, Cl. 427-121.000
Clumpner, J Michael *See*—
O'Lenick, Anthony J., Jr., Miller, John C., and Clumpner, J Michael, 5,010,173, Cl. 528-408.000
Coates, Don M., and Young, Patrick H., to Du Pont de Nemours, E I., and Company, Process of making acicular para-aramide particles, 5,009,820, Cl. 264-13.000
Coccia diferro, Michael J., and De Serio, Robert J., to American Standard Inc, Method and apparatus for protecting the finished surfaces of sanitary fixtures, 5,009,059, Cl. 53-472.000
Cohen, Allen L, Contact lenses utilizing keel orientation, 5,009,497, Cl. 351-161.000
Cohen, Richmond R., and Luzio, Gary A., to Hoechst Celanese Corporation, Selective delivery and retention of aldehyde and nicotine by-product from cigarette smoke, 5,009,239, Cl. 131-342.000
Colafati, Ralph Water blown foam, 5,010,116, Cl. 521-155.000
Cole, Edward H., Jr *See*—
Ivey, John S., Bateman, Paul M., Clauss, Julius A., Cole, Edward H., Jr., and Mott, Philip J., 5,009,631, Cl. 474-213.000
Cole, Susan M., to Minnesota Mining and Manufacturing Company, Method for attaching a pressure-sensitive film article having high moisture vapor transmission rate, 5,009,224, Cl. 128-156.000
Coleman, Darold D., and Nesseth, Raymond P., to NTH, Inc, Wire mesh straightening method and apparatus, 5,009,545, Cl. 404-100.000
Collier, Billie J *See*—
Collier, John R., and Collier, Billie J., 5,009,954, Cl. 428-400.000
Collier, John R., and Collier, Billie J., to Ohio University, Sheath-core fiber and its method of manufacture, 5,009,954, Cl. 428-400.000
Collins, Aaron A *See*—
Scheller, Clifford D., Collins, Aaron A., and Hansen, Joseph M., 5,010,553, Cl. 371-35.000
Colliopoulos, John A., to Procter & Gamble Company, The, Psyllium mucilloid fiber food products, 5,009,916, Cl. 426-615.000
Colombier, Christian, and Cuer, Jean-Pierre, to Atochem, Process for preparing polysiloxazane compositions and the products formed thereby, 5,010,158, Cl. 528-28.000

Colorado National Manufacturers, Inc *See*—
Urich, Oren D., and Meyer, Vernie G., 5,009,062, Cl. 56-341.000

Manfredi, Carl, Manfredi, Antonina, Manfredi, Dario P. and Giarraffa, Savia, 5,009,374, Cl. 244-1.00R

Giesler, Richard *See—*
Minshall, Billy W., Purohit, Kailash, Nygard, John F., Sintim-Damoa, Kwame, Giesler, Richard, and Woodworth, Archie, 5,009,654, Cl. 604-410.000

Gilberto, Daniel G. to Grant, Robert A. Bourque, Douglas A.; and Felt, Mildred T., a part interest. Torque device, 5,009,132, Cl. 81-57.300

Giles, Gary J., to Dresser Industries, Inc. System to avoid icing in the discharge piping of a pressure relief valve, 5,009,246, Cl. 137-205.500

Gill, Manzur, and Lin, Sung-Wei, to Texas Instruments Incorporated. Method of making hot electron programmable, tunnel-electron erasable contactless EEPROM, 5,010,028, Cl. 437-43.000

Gillette Canada Inc. *See—*
Suhonen, Christopher H., 5,009,883, Cl. 424-52.000
Suhonen, Christopher H., 5,009,884, Cl. 424-52.000

Gillette Company, The *See—*
Bodkins, Stanley H., 5,009,334, Cl. 211-54.100

Gimlett, James L., to Bell Communications Research, Inc. Ultrawide bandwidth low-noise optical receiver, 5,010,588, Cl. 455-619.000

Ginestet, Philippe *See—*
Rene, Didier, Dusseux, Thierry, and Ginestet, Philippe, 5,010,348, Cl. 343-700.0MS

Gingerich, Richard G. W. *See—*
Reilly, Kenneth T., Gingerich, Richard G. W. and Poss, Christopher S., 5,009,808, Cl. 252-301.60S

Gist-Brocades NV *See—*
Brake, Anthony J., and Van Den Berg, Johan A., 5,010,182, Cl. 536-27.000

Glaenzer-Spicer *See—*
Roullot, Michel, 5,009,628, Cl. 464-111.000

Glaxo Group Limited *See—*
Hayes, Ann G. and Birch, Phillip J., 5,010,096, Cl. 514-411.000

Gleaves, John T. *See—*
Ebner, Jerry R., and Gleaves, John T., 5,009,849, Cl. 422-83.000

Gleich, Peter *See—*
Hahn, Klaus, Guhr, Uwe, Hintz, Hans, Wittenberg, Dietmar, and Gleich, Peter, 5,010,111, Cl. 521-56.000

Glicksman, Leon R. and Lanciani, Arlene J., to Massachusetts Institute of Technology. Method and apparatus for improving the insulating properties of closed cell foam, 5,010,112, Cl. 521-76.000

Glinnorz, Lothar *See—*
Schoettle, Klaus, Buhk, Artur, and Glinnorz, Lothar, 5,010,434, Cl. 360-132.000

Glockler, Gerhard, Muller, Heinz, Kepplinger, Leopold W.; Matzawrakos, Panajiotis, Koch, Erwin, and Auberger, Heinrich, to Voest-Alpine Industrieanlagenbau GmbH. Plant to be used for metallurgical treatments of metal compounds and/or metal alloys or for producing calcium carbide, 5,009,397, Cl. 266-197.000

Glomb, Reiner Maresch, Peter and Wagner, Ralf, to Th. Kieserling & Albrecht GmbH & Co., Werkzeugmaschinenfabrik. Turning machine, 5,009,136, Cl. 82-127.000

Gocho, Makoto. *See—*
Noda, Hidetoshi, Gocho, Makoto, Shimizu, Masayasu, Komatsu, Osamu, and Inoue, Hideaki, 5,009,707, Cl. 75-375.000.

Goelzer, Alan R., to Stone & Webster Engineering Corporation. Process for catalytic cracking of hydrocarbons, 5,009,769, Cl. 208-113.000

Goldberg, Barry A. to Westvaco Corporation. Composite paperboard and polymer package, 5,009,939, Cl. 428-34.200

Goldfarb, Adolph E. and Goldfarb, Martin L., to Goldfarb, Adolph E. Surprise action game, 5,009,431, Cl. 273-258.000.

Goldfarb, Martin L. *See—*
Goldfarb, Adolph E. and Goldfarb, Martin L., 5,009,431, Cl. 273-258.000

Goldsmith, Alan and Forbes, Hugh O. to Xerox Corporation. Self contained troubleshooting aid for declared and non declared machine problems, 5,010,551, Cl. 371-16.400

Goldsmith, Robert L., to CeraMem Corporation. Cross-flow filtration device with filtrate network and method of forming same, 5,009,781, Cl. 210-247.000

Gomez, Fernando *See—*
Snowden, Gregory O., Barrett, Clifford E. III and Gomez, Fernando, 5,010,330, Cl. 340-825.210

Gomi, Takayuki, to Sony Corporation. Process for making bipolar transistor, 5,010,026, Cl. 437-31.000

Gonda, Hideyuki, to Sanden Corporation. Electromagnetic clutch having a structure for reducing impact noise, 5,009,297, Cl. 192-84.00C

Goodchild, Clive D. *See—*
Larner, David J. and Goodchild, Clive D., 5,010,321, Cl. 340.600.000

Goodman, David D. and Domnitz, Robert, to Inline Connection Corporation. Video transmission and control system utilizing internal telephone lines, 5,010,399, Cl. 358-85.000

Goodman, Kenneth R. *See—*
Gardner, Wallace R., Goodman, Kenneth R., Puckett, Robert D. and Draehn, Ricky L., 5,010,333, Cl. 340-856.000

Goodwin, Brent E., Karn, Donald L. and Mistyurik, John D., to Monarch Marking Systems, Inc. Hand-held labeler, 5,009,739, Cl. 156-384.000.

Gordon, Herman B., Owens, Mark J., Rubinstein, Leon, and Simpson, Scott, to Rogers Corporation. Flexible circuit connector, 5,009,607, Cl. 439-67.000.

Gordon, Ralph A. *See—*
Hoffman, Chalres T., Jr., Gordon, Ralph A., Hosmer, Thomas P. and Lucas, Robert M., 5,009,292, Cl. 188-71.700.

Gordon, Richard A. Tank cover III, 5,009,190, Cl. 119-5.000

Gordon, Richard A. Circular cat toy, 5,009,193, Cl. 119-29.000

Gorlitsyn, Nikolai V. *See—*
Paton, Boris E.; Utkin, Vladimir F., Nedoseka, Anatoly Y., Khromyak, Nikolai I., Gorlitsyn, Nikolai V., Tikhy, Viktor G., Mezintsev, Evgeny D. and Mezhuev, Nikolai N., 5,010,503, Cl. 364-569.000

Gorski, Jack: *See—*
Schuler, Linda A., Gorski, Jack; Hurley, Walter L., Bremel, Robert D., and Rottman, Fritz M., 5,010,011, Cl. 435-252.300

Gorthey, Lee A. *See—*
Chapman, George R., Jr.; Gorthey, Lee A. and Priester, Donnan E., 5,010,130, Cl. 524-445.000

Gorton, Lanny A., to Pacesetter Infusion, Ltd. Patient-controlled analgesia security attachment for a medication infusion system, 5,009,641, Cl. 604-131.000

Gottneid, David J. *See—*
Mauro, David J., Furesik, Susan I., Katz, Frances R., Faron, Eugene J., II, Gottneid, David J. and Pustek, Frank J., 5,009,911, Cl. 426-578.000

Goubeaux, Ronald J., and Pettitt, Edward D., to General Motors Corporation. Low refrigerant charge protection method for a variable displacement compressor, 5,009,074, Cl. 62-115.000.

Gould, John H., to United States of America, Health and Human Services. Quick color test to detect lead release from glaze and enamel coatings, 5,010,020, Cl. 436-77.000

Goulter, Barbara *See—*
Goulter, Victor, and Goulter, Barbara, 5,009,649, Cl. 604-351.000

Goulter, Victor, and Goulter, Barbara. Expandable banded male urinary incontinence condom and supporting undergarment, 5,009,649, Cl. 604-351.000

Grabinski, Piotr, to Foothills Diamond Coring (1980) Ltd. Deflection apparatus, 5,009,273, Cl. 175-61.000

Graham, John A. *See—*
Wilson, Cary L., and Graham, John A., 5,009,685, Cl. 55-385.200

Grandjean, Pierre-Andre; and Lee, Philip H. J., to Medtronic, Inc. Steroid eluting intramuscular lead, 5,009,229, Cl. 128-419.00P

Grange, Kenneth, to Wilkinson Sword Gesellschaft mit beschrankter Haftung. Razor, 5,009,003, Cl. 30-30.000

Granger, Yves and Wind, Daniel, to International Business Machines Corporation. Scanner interface for the line adapters of a communication controller, 5,010,548, Cl. 370-95.100

Grant Airmass Corporation. *See—*
Grant, Benton H., 5,009,579, Cl. 417-413.000

Grant, Benton H. to Grant Airmass Corporation. Fluid pump encasement, 5,009,579, Cl. 417-413.000

Grant, Robert A. *See—*
Gilberto, Daniel G., 5,009,132, Cl. 81-57.300

Grant TFW. *See—*
Carlin, Frank J., 5,010,225, Cl. 219-76.120

Grard, Guy *See—*
Less, Jacques, Perreau, Philippe, Bary, Daniel, and Grard, Guy, 5,009,512, Cl. 374-6.000

Grasdepot, Francois, to Schlumberger Industries. Optical pressure sensor and a method and apparatus for making such a sensor, 5,009,107, Cl. 73-705.000

Greco, Alberto, to Enichem Synthesis S.p.A. Novel silicon-organic compounds, containing an oxazolidine group, 5,010,202, Cl. 548-110.000

Green, Paul E., to Rockwell International Corporation. Charge domain successive approximation analog to digital converter, 5,010,340, Cl. 341-172.000

Greer, James A., to Raytheon Company. Saw device, 5,010,270, Cl. 310-313.00D

Gregory, Peter-Colin *See—*
Waldeck, Harald, Benson, Werner, Zeugner, Horst, Wolf, Klaus-Ullrich, Gregory, Peter-Colin, Hamminga, Derk, and van Wijngaarden, Ineke, 5,010,076, Cl. 514-221.000

Greif, Norbert *See—*
Martischius, Franz-Dieter, Vogel, Hans-Henning, Greif, Norbert, Oppenlaender, Knut, Denzinger, Walter, and Hartmann, Heinrich, 5,009,670, Cl. 44-385.000

Greife, Heinrich *See—*
Lindel, Hans, Hallenbach, Werner, Berschauer, Friedrich, Greife, Heinrich, and Klotz, Gernot, 5,010,091, Cl. 514-357.000

Griess, Gary A. *See—*
Serwer, Philip, and Griess, Gary A., 5,009,759, Cl. 204-182.800

Griffiths, John M. *See—*
Bankstahl, Herbert A., Forsgren, Lyle M., Newman, Neil A., Beck, Wayne T., and Griffiths, John M., 5,009,621, Cl. 440-75.000

Grigat, Ernst, Meckel, Walter, and Nippe, Burkhard, to Agfa Gevaert Aktiengesellschaft. Process for the production of magnetic recording carriers, 5,009,925, Cl. 427-48.000

Grigo, Ulrich *See—*
Serini, Volker, Freitag, Dieter, Westeppe, Uwe, Idel, Karsten, Grigo, Ulrich, Casser, Carl, Paetz, Klaus-Christian, and Hajek, Manfred, 5,010,162, Cl. 528-196.000
Serini, Volker, Freitag, Dieter, Westeppe, Uwe, Idel, Karsten, Grigo, Ulrich, Casser, Carl, Paetz, Klaus-Christian, and Hajek, Manfred, 5,010,163, Cl. 528-196.000
Westeppe, Uwe, Weymans, Gunther, Grigo, Ulrich, Idel, Karsten-Josef, and Freitag, Dieter, 5,010,147, Cl. 525-462.000

Grimm, Noel P., and Seivar, James, to Westinghouse Electric Corp. Method for temporary shielding of reactor vessel internals, 5,009,836, Cl. 376-260.000

Grinberg, Jan Welkowsky, Murray S. Wu, Chung-Sheng, and Braatz, Paul O., to Hughes Aircraft Company. Radiation detector array using radiation sensitive bridges, 5,010,251, Cl. 250-332.000

Grinberg, Oded, to MNY Holdings and Agencies Limited. Non-penetrating projectile and means therefor, 5,009,164, Cl. 102-502.000

Grindley, Inc *See—*
Grindley, John R., and Grindley, Robert M., 5,009,244, Cl. 137-101.110

Grindley, John R. and Grindley, Robert M., to Grindley, Inc., and Robwen, Inc. Fire fighting foam mixing system, 5,009,244, Cl. 137-101.110

Grindley, Robert M *See—*
Grindley, John R. and Grindley, Robert M., 5,009,244, Cl. 137-101.110

Grisoni, Bernard F., to Dow Corning France S.A. Silicone foams, 5,010,115, Cl. 521-154.000

Grob, Ferdinand, Kienzler, Dieter, Linder, Ernst, Potschin, Roger, and Stutzenberger, Heinz, to Robert Bosch GmbH. Apparatus for measuring the particulate matter in the flue gas or exhaust gas from a combustion process, 5,009,064, Cl. 60-276.000

Grollier, Jean-Francois, Fiquet, Claire, Fourcadier, Chantal, Dubief, Claude, and Cauwet, Daniele, to L'Oreal. Composition and process for the treatment of keratin materials with polymers, 5,009,880, Cl. 424-047.000

Gronvald, Frederik C. and Braestrup, Claus, to Novo Nordisk A/S. N-(butenyl substituted) azaheterocyclic carboxylic acids, 5,010,090, Cl. 514-326.000

Gronwald, Frederik, Andersen, Peter H., Faarup, Peter, Guddal, Erling, Hansen, Kristian T. Hansen, Louis B., and Nielsen, Erik B., to Novo Nordisk A/S. Novel benzazepine derivatives, 5,010,074, Cl. 514-213.000

Groover, Robert, III, to Texas Instruments Incorporated. Insulator separated vertical CMOS, 5,010,386, Cl. 357-42.000

Grossman, M. Gary, and Meisner, Edward H., to GEE Associates. Microwaveable coffee makers, 5,010,221, Cl. 219-10.55E

Gruber, Milan A., to Shook, Ed, Jr. Roofing clamp, 5,009,050, Cl. 52-408.000

Gruber, Norman G., and Krauss, Owen T., to Western Atlas International, Inc. Down hole reservoir fluid sampler, 5,009,100, Cl. 73-155.000

Gruenwald, Heinrich, Ramisch, Hans, and Pawlakowitsch, Anton, to Leybold Aktiengesellschaft. Apparatus for plasma etching, 5,009,738, Cl. 156-345.000

Grumman Aerospace Corporation *See—*
Giangano, David A., Kesselman, Martin, Boeskor, Steven, and Celona, Anthony R., 5,010,339, Cl. 341-164.000
Solomon, Allen L., 5,010,025, Cl. 437-29.000

Grunthaner, Paula J. *See—*
Lin, True-Lon, Fathauer, Robert W., and Grunthaner, Paula J., 5,010,037, Cl. 437-200.000

Grunwald, Werner, Holfelder, Gerhard, De La Prieta, Claudio, and Schmid, Kurt, to Robert Bosch GmbH. Printing paste and method of applying said paste, 5,009,708, Cl. 106-105.000

Grunwald, Werner *See—*
Fedter, Horst, Grunwald, Werner, Nolting, Peter, de la Prieta, Claudio, and Schmid, Kurt, 5,010,315, Cl. 338-7.000

Grzembra, Barbara *See—*
Sprintschnik, Gerhard, Niederstaetter, Walter, Reiss, Kurt, von Asten, Wolfgang, Scharf, Gunther, and Grzembra, Barbara, 5,009,722, Cl. 148-2.000

GTE Government Systems Corporation *See—*
Leonard, Donald A., and Sweeney, Harold E., 5,009,500, Cl. 356-43.000

GTE Products Corporation *See—*
Kim, Tai K., and Vanderpool, Clarence D., 5,009,788, Cl. 210-639.000
Reddy, V. Butchi, 5,009,807, Cl. 252-301.40H
Reilly, Kenneth T., Gingerich, Richard G. W., and Poss, Christopher S., 5,009,808, Cl. 252-301.60S

Guddal, Erling *See—*
Gronwald, Frederik, Andersen, Peter H., Faarup, Peter, Guddal, Erling, Hansen, Kristian T., Hansen, Louis B., and Nielsen, Erik B., 5,010,074, Cl. 514-213.000

Gueret, Jean-Louis, to L'Oreal. Piston dispenser for paste or solid products, 5,009,534, Cl. 401-75.000

Gueroult, Alain *See—*
Clairouin, Noel, Gueroult, Alain, and Lemoyne, Remi, 5,009,918, Cl. 426-643.000

Gugel, Bernd, Kaufmann, Clemens, Kitzberger, Herbert, and Rohrer, Kurt, to Mannesmann Aktiengesellschaft. Matrix print head of hinged-clapper-armature construction, 5,009,529, Cl. 400-124.000

Guhr, Uwe *See—*
Hahn, Klaus, Guhr, Uwe, Hintz, Hans, Wittenberg, Dietmar, and Gleich, Peter, 5,010,111, Cl. 521-56.000

Hubbard, Vance M., and Brunson, Welton K., to Tecnol, Inc. Sanitary head covering and method of manufacture. 5,008,961, Cl. 2-195.000

Huberty, John P. *See*—
Engelstad, Barry L.; Raymond, Kenneth N.; Huberty, John P.; and White, David L., 5,010,191, Cl. 544-225.000

Huebner, Werner. *See*—
Steck, Werner; Marosi, Laszlo; Haberkorn, Herbert; Feser, Rainer; Huebner, Werner; and Jakusch, Helmut, 5,009,877, Cl. 424-607.000.

Huels Aktiengesellschaft *See*—
Scharf, Helmut, 5,009,878, Cl. 423-608.000

Huenniken, Peter Gurd; John A., and Woodman, Douglas, to Siemens Automotive Limited. Inertia switch mounting housing. 5,010,217, Cl. 200-61.45R

Huffaker, Almyra; and Spector, George. Instruction clip for sewing machine. 5,009,382, Cl. 248-284.000

Hughes Aircraft Company *See*—
Bathrick, Erwin W.; and Zmuda, James E., 5,010,572, Cl. 380-21.000.
Crumly, William R.; Wonth, Blake F.; and Walen, James R., 5,009,605, Cl. 439-67.000
Grinberg, Jan; Welkowsky, Murray S.; Wu, Chiung-Sheng; and Braatz, Paul O., 5,010,251, Cl. 250-332.000
Hall, James T., 5,009,485, Cl. 350-163.000
Iossi, Daryl R.; Cook, Lacy G.; and Koppensteiner, Alfred, 5,009,494, Cl. 350-620.000
Kelly, Kenneth C., 5,010,351, Cl. 343-771.000
Shih, I-Fu; Chang, David B.; Arns, James A.; Moss, Gaylord F.; and Smith, Ronald T., 5,009,502, Cl. 356-152.000

Hughes, Dale L. *See*—
Sawyer, Alan G.; Hughes, Dale L.; and Petree, Edwyn H., 5,009,006, Cl. 30-90.600

Hughes, Ian *See*—
Markwell, Roger F.; Smith, Stephen A.; Hughes, Ian; and Gaster, Laramie M., 5,010,097, Cl. 514-419.000

Huizinga, Gert J., to L.PF Verpakkingen B.V. Method of forming lines of weakness in or grooving a plastic material, especially a packaging material, 5,010,231, Cl. 219-121.690

Hula, Emil; and Maresch, Gerald, to Maschinenfabrik Andritz Actiengesellschaft. Process and apparatus for the manufacture of a metal foil. 5,009,750, Cl. 204-13.000

Huls Aktiengesellschaft *See*—
Kelkenberg, Heike; Ruback, Wult; and Engel, Klaus, 5,009,814, Cl. 252-548.000

Hummel, Axel *See*—
Traubel, Harro; Strenger, Heinrich; Weber, Karl A.; Muller, Hans Werner; Zapfel, Horst; and Hummel, Axel, 5,009,921, Cl. 427-31.000

Hungerford, Robert E. Barbecuing protective food support. 5,009,151, Cl. 99-445.000

Hunter Douglas Inc. *See*—
Fraser, Donald E., 5,009,258, Cl. 160-168.100

Hunter, Gregory H.; Wells, Benjamin A.; and Feldstein, Michael A., to Reflection Technology, Inc. Low vibration resonant scanning unit for miniature optical display apparatus. 5,009,473, Cl. 350-6.600

Huntley, William P., and Swanick, David J., to United States of America, Navy. High pulse repetition frequency radar early warning receiver. 5,010,341, Cl. 342-20.000

Hurley, Walter L. *See*—
Schuler, Linda A.; Gorski, Jack; Hurley, Walter L.; Bremel, Robert D.; and Rottman, Fritz M., 5,010,011, Cl. 435-252.300

Hutchings, Michael G. *See*—
McDonald, Edward; Salmon, Roger; Whittle, Alan J.; and Hutchings, Michael G., 5,010,200, Cl. 546-245.000

Hutchinson, Donald P. to EOL, Inc. Personal glucose monitor. 5,009,230, Cl. 128-633.000

Huth, Andreas *See*—
Braestrup, Claus T.; Nielsen, Mogens C.; Christensen, Joergen A.; Engelstoft, Mogens; Schou, Henning; Eder, Ulrich; Neef, Gunter; Huth, Andreas; Rahtz, Dieter; and Schmechen, Ralph, 5,010,077, Cl. 514-228.800

Hvozda, Carl K. *See*—
Karg, Kenneth A.; Hvozda, Carl K.; Neddermeyer, Robert N.; and Feld, Alexander, 5,009,148, Cl. 98-10.000

Hyland, George J., to Crane Co. Motor-driven pumps. 5,009,578, Cl. 417-365.000

Hyvarinen, Olli V. J. *See*—
Heimala, Seppo O.; Hyvarinen, Olli V. J.; and Metsarinta, Marja Leena, 5,009,870, Cl. 423-239.000

I-Stat Corporation *See*—
Lauks, Imants R., 5,009,766, Cl. 204-419.000

Ibach, Harald *See*—
Boden, Karl; Ibach, Harald; and Linke, Udo, 5,009,865, Cl. 422-249.000

Ibe, Hiroyuki, and Uesugi, Toshiharu, to Shin-Etsu Handotai Company Limited. Recharging device for czochralski method. 5,009,864, Cl. 422-249.000

Ibsen, Robert L.; Chadwick, Thomas C.; and Pritchard, Sally A., to Den-Mat Corporation. Strong dental porcelain and method for its manufacture. 5,009,709, Cl. 106-35.000

Ichihara, Yasuo *See*—
Kirihara, Tomoo; Nakagawa, Ippei; Seki, Yoshinobu; Honda, Yutaka; and Ichihara, Yasuo, 5,009,751, Cl. 204-61.000

Ichikawa, Fumitoshi *See*—
Tokiwa, Yukio; Ichikawa, Fumitoshi; Nakamura, Naomi; Hirose, Syunichi; and Inokuchi, Haruhisa, 5,010,467, Cl. 363-37.000

Ichikawa, Mitsuo *See*—
Matsumoto, Sakae; and Ichikawa, Mitsuo, 5,009,121, Cl. 74-493.000

Idel, Karsten *See*—
Serini, Volker; Freitag, Dieter; Westeppe, Uwe; Idel, Karsten; Grigo, Ulrich; Casser, Carl; Paetz, Klaus-Christian; and Hajek, Manfred, 5,010,162, Cl. 528-196.000
Serini, Volker; Freitag, Dieter; Westeppe, Uwe; Idel, Karsten; Grigo, Ulrich; Casser, Carl; Paetz, Klaus-Christian; and Hajek, Manfred, 5,010,163, Cl. 528-196.000

Idel, Karsten-Josef *See*—
Westeppe, Uwe; Weymans, Gunther; Grigo, Ulrich; Idel, Karsten Josef; and Freitag, Dieter, 5,010,147, Cl. 525-462.000

Idemitsu Petrochemical Co., Ltd. *See*—
Tomotsu, Norio, 5,010,151, Cl. 526-105.000

Iggulden, Jerry R. *See*—
Streck, Donald A.; and Iggulden, Jerry R., 5,009,368, Cl. 239-70.000.

Ihara, Hirokazu *See*—
Mori, Kinji; Kunai, Yuko; Akiyama, Masakazu; Kadoya, Tadaaki; Kawano, Katsumi; Miyamoto, Shoji; Nohmi, Makoto; Shingai, Sadanori; and Ihara, Hirokazu, 5,010,479, Cl. 364-200.000

Iida, Hideyo *See*—
Hayashi, Yutaka; Itoh, Atuo; Imai, Mizuho; and Iida, Hideyo, 5,009,928, Cl. 427-126.300

Iida, Shinobu; Fujiyama, Masaaki; and Yamada, Keisuke, to Fuji Photo Film Co., Ltd. Process for the preparation of magnetic recording medium. 5,009,929, Cl. 427-130.000

Iizuka, Nobuyuki; Hirose, Fumiyuki; Asahi, Naotatsu; and Kojima, Yoshitaka, to Hitachi, Ltd. Combustion apparatus for gas turbine. 5,009,070, Cl. 60-753.000

Ikada, Yoshito, and Gen, Shokyu, to Daicel Chemical Industries, Ltd. Polylactic acid fiber. 5,010,145, Cl. 525-415.000

Ikata, Yoshikatsu *See*—
Utsugi, Nobuo; Kihara, Hisashi; Mori, Shuichi; Fuse, Junichi; Miyake, Takashi; and Ikata, Yoshikatsu, 5,010,437, Cl. 360-137.000

Ikebe, Masaru *See*—
Shiba, Haruo; Ikebe, Masaru; and Ishida, Toshihiko, 5,010,435, Cl. 360-133.000

Ikeda Bussan Co., Ltd. *See*
Mouri, Takayuki, 5,009,469, Cl. 297-468.000

Ikeda, Hayato; Sawada, Masahiro; Nakamura, Norihiko; and Yokomachi, Naoya, to Kabushiki Kaisha Toyoda Jidoshokki Seisakushi. Lubricating oil supplying mechanism in swash plate type compressor. 5,009,286, Cl. 184-6.170

Ikeda, Hayato; Sawada, Masahiro; and Nakamura, Norihiko, to Kabushiki Kaisha Toyoda Jidoshokki Seisakusho. Thrust bearing and shoe lubricator for a swash plate type compressor. 5,009,574, Cl. 417-222.000

Ikeda, Hisami *See*—
Albino, Anthony Lloyd; Kenneth Ikeda, Hisami; and Old, Lloyd, 5,009,995, Cl. 435-7.230.

Ikeda, Kazunari, and Sanada, Koichi, to Bridgestone Corporation. Method of manufacturing member for use in tire including engaging wires between gears. 5,009,732, Cl. 156-177.000

Ikeda, Kenichi *See*—
Hasegawa, Minekazu; Ikeda, Kenichi; and Fujihira, Junichi, 5,009,464, Cl. 296-213.000

Ikeda, Kyoichi *See*—
Harada, Kinji; Ikeda, Kyoichi; Kuwayama, Hideki; Kobayashi, Takashi; Nishikawa, Tadashi; Watanabe, Tetsuya; and Yoshida, Takashi, 5,009,108, Cl. 73-704.000

Ikeda, Masaaki *See*—
Kanehira, Makoto; Nakagawa, Takerou; Isubakimoto, Yasumasa; Tanaka, Kouji; Takahashi, Toshio; and Ikeda, Masaaki, 5,009,630, Cl. 474-211.000

Ikeda, Miyuki *See*—
Ogino, Masanori; Yamada, Takeo; and Ikeda, Miyuki, 5,010,280, Cl. 315-366.000

Ikeda, Takeo *See* Ikeda, Takeo, Sushi forming method. 5,009,905, Cl. 426-297.000

Ikeda, Yasuhiro, to Shin-Etsu Handotai Co., Ltd. Semiconductor rod zone melting apparatus. 5,009,860, Cl. 422-250.000

Ilford Limited *See*—
Mowforth, Clive W.; Bullock, James F.; Maternaghan, Trevor J.; and Harvey, Karen N., 5,009,991, Cl. 430-567.000

Kalfoglou, George, to Texaco Inc. Method of using a combination lignosulfonate/polyalkylene glycol system as a sacrificial agent for surfactant flooding 5,009,268, Cl. 166-274.000

Kali-Chemie AG *See*—
Schwetje, Norbert, Sizmann, Rudolf, and Khelifa, Noureddine, 5,009,071, Cl. 62-4.000

Kali-Chemie Pharma GmbH *See*—
Waldeck, Harald, Benson, Werner, Zeugner, Horst, Wolf, Klaus Ullrich, Gregory, Peter-Colin, Hamminga, Derk, and van Wijngaarden, Ineke, 5,010,076, Cl. 514-221.000

Kalina, Jaroslav *See*—
Pajgrt, Jan, Smetak, Vincenc, Kalina, Jaroslav, Zemek, Michal, Pus, Milan, and Bucek, Pavel, 5,009,253, Cl. 139-116.200

Kalman, Thomas I., to Research Foundation of State University of N.Y. The Compositions and methods comprising 2-mercaptomethylglutaric acid derivatives 5,010,103, Cl. 514-495.000

Kalotay, Paul, Bruck, Robert, Emch, Arnold, and Martella, Donald, to Micro Motion, Inc. Flow tube drive circuit having a bursty output for use in a coriolis meter 5,009,109, Cl. 73-861.380

Kalter, Howard L. *See*—
Fifield, John A., and Kalter, Howard L., 5,010,524, Cl. 365-205.000

Kamayachi, Yuichi, and Inagaki, Syoji, to Taiyo Ink Manufacturing Co., Ltd. Resist ink composition 5,009,982, Cl. 430-280.000

Kamei, Yasuo *See*—
Akizawa, Nobuyuki, Kudo, Yasunori, Kanai, Toshiyuki, Kamei, Yasuo, Oyama, Nobuaki, and Negishi, Akihito, 5,009,355, Cl. 227-114.000

Kameyama, Fumio, and Hattori, Chikamasa, to Brother Kogyo Kabushiki Kaisha Machine tool 5,009,554, Cl. 409-231.000

Kamijo, Eiji *See*—
Ogata, Kiyoshi, Ando, Yasunori, and Kamijo, Eiji, 5,009,923, Cl. 427-38.000

Kamio, Hiroshi *See*—
Shima, Yoshinobu, and Kamio, Hiroshi, 5,009,863, Cl. 422-249.000

Kamishiiri, Nobuyuki, Kaneda, Manabu, Tanaami, Toshiyasu, and Maeda, Miho, to Kao Corporation Surface material for sanitary articles and its preparing method 5,009,651, Cl. 604-378.000

Kamiya, Takashi *See*—
Yamauchi, Hiroshi, Sugiyama, Isao, Saito, Isao, Nomoto, Seiichiro, Kamiya, Takashi, Machida, Yoshimasa, and Negi, Shigeto, 5,010,188, Cl. 540-222.000

Kamiyama, Masayuki *See*—
Aoki, Masaaki, Kamiyama, Masayuki, Asai, Kiyotsugu, and Yamaguchi, Akihiro, 5,010,161, Cl. 528-59.000

Kamizawa, Koh *See*—
Murakami, Tokumichi, Asai, Kohtaro, Kamizawa, Koh, Nishida, Masami, Yamazaki, Eizo, Itoh, Atsushi, and Kinjoh, Naoto, 5,010,401, Cl. 358-136.000

Kamrat, Esko, to Janesko Oy Arrangement for displacing a measuring head of a measuring means into and from a process space 5,009,113, Cl. 73-866.500

Kanai, Seita *See*—
Edahiro, Takeshi, and Kanai, Seita, 5,009,449, Cl. 280-690.000

Kanai, Toshiyuki *See*—
Akizawa, Nobuyuki, Kudo, Yasunori, Kanai, Toshiyuki, Kamei, Yasuo, Oyama, Nobuaki, and Negishi, Akihito, 5,009,355, Cl. 227-114.000

Kanaya, Yasuhiko *See*—
Arai, Kunio, and Kanaya, Yasuhiko, 5,010,232, Cl. 219-121.700

Kanda, Makoto *See*—
Mitarai, Tadashi, and Kanda, Makoto, 5,009,590, Cl. 432-121.000

Kanda, Takashi *See*—
Hasegawa, Takanori, Abe, Nobuyuki, Hibara, Toru, Hirose, Toshihiko, Kanda, Takashi, Saito, Hiroshi, Oshima, Masaki, and Nakazawa, Eiji, 5,010,420, Cl. 358-471.000

Kandachi, Takayoshi, to Central Glass Company, Limited. Sintered glass body with opaquely mottled pattern and method of producing same 5,010,042, Cl. 501-32.000

Kane, John M. *See*—
Palfreyman, Michael G., Wiech, Norbert L., Cheng, Hsien C., and Kane, John M., 5,010,072, Cl. 514-183.000

Kaneda, Manabu *See*—
Kamishiiri, Nobuyuki, Kaneda, Manabu, Tanaami, Toshiyasu, and Maeda, Miho, 5,009,651, Cl. 604-378.000

Kanehira, Makoto, Nakagawa, Takerou, Tsubakimoto, Yasumasa, Tanaka, Kouji, Takahashi, Toshio, and Ikeda, Masaaki, to Tsubakimoto Chain Co. Chain formed by link elements of identical shape 5,009,630, Cl. 474-211.000

Kanehisa, Osam *See*—
Migita, Masahito, Uda, Tsuyoshi, Kanehisa, Osam, and Shiiki, Masatoshi, 5,010,517, Cl. 365-114.000

Kaneko, Toshimi, Morinaga, Tetsuya, and Hatakenaka, Tetsuo, to Murata Manufacturing Co., Ltd. Chip coil 5,010,313, Cl. 335.296.000

Kaneshige, Masatoshi *See*—
Asanuma, Masato, and Kaneshige, Masatoshi, 5,009,187, Cl. 118-658.000

Kang, Sung H., to Sung Ho Korea Company Electronic switching ballast for a fluorescent lamp 5,010,278, Cl. 315-224.000

Kanno, Masayuki, to Kabushiki Kaisha Toshiba Data processing apparatus having function for retrieving abstract and original image data 5,010,581, Cl. 382-56.000

Kansai Paint Co., Ltd. *See*—
Morita, Kaoru, and Shioda, Atsushi, 5,010,149, Cl. 525-481.000

Kao Corporation *See*—
Kamishiiri, Nobuyuki, Kaneda, Manabu, Tanaami, Toshiyasu, and Maeda, Miho, 5,009,651, Cl. 604-378.000
Watanabe, Taichi, Ogino, Hidekazu, Hirota, Hajime, Koshika, Tomohito, Moriya, Naoko, and Nozaki, Toshio, 5,009,813, Cl. 252-545.000

Kappas, Attallah, and Drummond, George S., to Rockefeller University, The Use of liposomes as carriers for metalloporphyrins 5,010,073, Cl. 514-185.000

Karasawa, Akira *See*—
Oshima, Etsuo, Obase, Hiroyuki, Karasawa, Akira, Kubo, Kazuhiro, Miki, Ichiro, and Ishii, Akio, 5,010,087, Cl. 514-307.000
Oshima, Etsuo, Obase, Hiroyuki, Karasawa, Akira, Kubo, Kazuhiro, Miki, Ichiro, and Ishii, Akio, 5,010,104, Cl. 514-510.000

Karg, Kenneth A., Hvozda, Carl K., Neddermeyer, Robert N., and Feld, Alexander, to AEG Westinghouse Transportation Systems, Inc. Vehicle air exchange according to passenger load 5,009,148, Cl. 98-10.000

Karl H. Sengewald KG *See*—
Kruessel, Bernhard, 5,009,632, Cl. 493-189.000

Karl Lautenschlager GmbH & Co. KG *See*—
Lautenschlager, Karl, and Lautenschlager, Gerhard W., 5,008,977, Cl. 16-278.000

Karl Storz Endoscopy-America, Inc. *See*—
Damgaard-Iversen, Karsten, Morris, Robert C., Chin, Timothy C. and Kuper, Jerry W., 5,009,658, Cl. 606-128.000

Karlsson, Markku *See*—
LePisto, Matti, Ilmanen, Reijo, Karlsson, Markku, and Laakso, Sauli, 5,009,016, Cl. 34-41.000

Karn, Donald L. *See*—
Goodwin, Brent E., Karn, Donald L., and Mistyurik, John D., 5,009,739, Cl. 156-384.000

Karsner, Grant G. *See*—
Bartilucci, Mark P., Karsner, Grant G., and Tracy, William J., III, 5,009,767, Cl. 208-85.000

Kasahara, Nobuo, Watanuki, Masayoshi, Maeno, Satoru, and Ohkuni, Masato, to Ricoh Company, Ltd., and Shinko Electric Co., Ltd. Black-and-white and color copier operable at different processing speeds 5,010,372, Cl. 355-313.000

Kashuba, Glen A. *See*—
Van Syckle, Peter B., and Kashuba, Glen A., 5,009,666, Cl. 623-23.000

Kast, Juergen *See*—
Keil, Michael, Schirmer, Ulrich, Kast, Juergen, Kolassa, Dieter, Wuerzer, Bruno, Meyer, Norbert, Rademacher, Wilhelm, Jung, Johann, and Carlson, Dale R., 5,009,702, Cl. 71-100.000

Katagawa, Hiromi, to Matsushita Electric Industrial Co., Ltd. Telephone-call distributor 5,010,569, Cl. 379-210.000

Katagiri, Shoichi *See*—
Yoshio, Junichi, Hosaka, Sumio, Matsuoka, Hisao, Tsuda, Youichirou, Katagiri, Shoichi, and Nomura, Satoru, 5,010,417, Cl. 358-335.000

Katahashi, Eriko *See*—
Matsubara, Shinichi, Uehara, Masafumi, Bunya, Shinichi, and Katahashi, Eriko, 5,009,981, Cl. 430-175.000

Katamoto, Tsutomu *See*—
Tamari, Kousaku, and Katamoto, Tsutomu, 5,009,712, Cl. 106-456.000

Katcherian, Ricky V., to General Motors Corporation Window reveal molding 5,009,462, Cl. 296-201.000

Kato, Eiichi, and Ishii, Kazuo, to Fuji Photo Film Co., Ltd. Electrophotographic photoreceptor 5,009,975, Cl. 430-96.000

Kato, Eiji *See*—
Harada, Kyouji, Kato, Eiji, Sakaguchi, Yoshikazu, Watanabe, Suzuaki, and Hoshino, Akira, 5,009,290, Cl. 188-71.500

Kato, Masaaki, to Fujitsu Limited Packet switching system 5,010,546, Cl. 370-85.110

Kato, Mikio *See*—
Kuzuya, Susumu, Shimizu, Seiji, Kato, Mikio, Ishikawa, Yujiro, Sakai, Takashi, and Yuki, Eiji, 5,009,530, Cl. 400-188.000

Kato, Osami *See*—
Otsuki, Hajime, Kusano, Hideaki, and Kato, Osami, 5,010,362, Cl. 355-74.000

Kato, Rentaro, and Suzuki, Tatsuya, to Tokai Rubber Industries, Ltd. Fluid-filled elastic mount 5,009,403, Cl. 267-140.100

Kato, Takafumi, to Alps Electric Co., Ltd. Push button switch with actuator for applying transverse force to buckling spring 5,010,219, Cl. 200-408.000

Katoh, Riichi, to Kabushiki Kaisha Toshiba Heterojunction bipolar transistor having double hetero structure 5,010,382, Cl. 357-34.000

Katoh, Takayuki, to Mitsubishi Denki Kabushiki Kaisha Method of making a semiconductor device operating in high frequency range 5,010,019, Cl. 437-8.000

Katou, Hiromi, and Kobayahsi, Hirokazu, to Kabushiki Kaisha Kenwood Packet data generator 5,010,549, Cl. 370-110.100

Katz, Frances R. *See*—
Mauro, David J., Furesik, Susan L., Katz, Frances R., Faron, Eugene J., II, Gottneid, David J., and Pustek, Frank J., 5,009,911, Cl. 426-578.000

Katz, Marcella M. Human lifelike dolls, mannequins and humanoids and pet animal dolls and methods of individualizing and personalizing same 5,009,626, Cl. 446-391.000

Katz, Michael Method of evaluating meconium content of amniotic fluid 5,009,507, Cl. 356-421.000

Katz, Murray *See*—
Guthrie, Robin J., Katz, Murray, and Schroll, Craig R., 5,009,968, Cl. 429-26.000

Katznelson, Ron D., to Titan Linkabit Corporation, and Cable/Home Communication Corporation Metering retrieval of encrypted data stored in customer data retrieval terminal 5,010,571, Cl. 380-4.000

Kaufmann, Clemens *See*—
Gugel, Bernd, Kaufmann, Clemens, Kitzberger, Herbert, and Rohrer, Kurt, 5,009,529, Cl. 400-124.000

Kaufmann, Dieter, and Gallenkamp, Bernd, to Bayer Aktiengesellschaft Process for the preparation of substituted 2-chloropyridines 5,010,201, Cl. 546-316.000

Kawada, Haruki *See*—
Eguchi, Ken, Kawada, Haruki, Sakai, Kunihiro, Tomida, Yoshinori, Matsuda, Hiroshi, Tsuboyama, Akira, Takimoto, Kiyoshi, and Takamatsu, Osamu, 5,009,489, Cl. 350-341.000

Kawada, Kazuo *See*—
Okumoto, Takaharu, Hayashida, Tadashi, Kawada, Kazuo, and Hayashi, Tetsuo, 5,009,423, Cl. 273-80.200

Kawagoe, Makoto *See*—
Sugimoto, Atsushi, Nakano, Osamu, Yasuda, Shigeru, Maeda, Chikatoshi, Ozone, Toshio, and Kawagoe, Makoto, 5,009,843, Cl. 420-112.000

Kawaguchi, Fumiaki *See*—
Enari, Masahiko, Shikichi, Satoshi Kawaguchi, Fumiaki, Suzuki, Kenichi, Usui, Masayuki, Matsuoka, Hiroshi, Matsuoka, Kazuhiko, Hosoya, Hideki, Aoki, Akio, and Minoura, Kazuo, 5,010,534, Cl. 369-32.000

Kawaguchi, Takayuki, Shiro, Takashi, Iwata, Kaoru, and Daido, Takahiro, to Teijin Limited Naphthalocyanine based compound and optical recording medium containing the same 5,009,986, Cl. 430-495.000

Kawai, Satoshi *See*—
Hiraoka, Takeshi, Takeguchi, Shunsuke, and Kawai, Satoshi, 5,009,123, Cl. 74-567.000

Kawakami, Toshikatsu, Fukuda, Shin, Shinbo, Hiroyasu, Unemura, Toyoaki, Sakamoto, Ken, and Kondo, Tomoji, to Matsushita Electric Industrial Co., Ltd. Apparatus for receiving character multiplex broadcasting 5,010,406, Cl. 358-147.000

Kawakubo, Hiroaki *See*—
Ueyama, Satoshi, Kawakubo, Hiroaki, Isoda, Satoru, and Maeda, Mitsuo, 5,010,451, Cl. 361-504.000

Kawamura, Hideaki, Fujibayashi, Kentaro, and Hitaka, Yosato, to Fanuc Ltd. Numerical control system 5,010,285, Cl. 318-569.000

Kawamura, Hideo, to Isuzu Motors Limited Electromagnetically operated valve assembly for use in internal combustion engine 5,009,202, Cl. 123-90.110

Kawamura, Hideo, to Isuzu Ceramics Research Institute, Co., Ltd. Electromagnetic force valve driving apparatus 5,009,389, Cl. 251-129.100

Kawamura, Katsumi, to Pioneer Electronic Corporation Pickup driving device for disk player 5,010,582, Cl. 388-815.000

Kawana, Shigeyuki, to Casio Computer Co., Ltd. IC card system for preventing unauthorized data alteration 5,010,237, Cl. 235-379.000

Kawano, Katsumi *See*—
Mori, Kinji, Kunai, Yuko, Akiyama, Masakazu, Kadoya, Tadaaki, Kawano, Katsumi, Miyamoto, Shoji, Nohmi, Makoto, Shingai, Sadanori, and Ihara, Hirokazu, 5,010,479, Cl. 364-200.000

Kawasaki Steel Corporation *See*—
Hayashi, Hiroyuki, Seto, Tsuneo, Miura, Hironori, and Fujimoto, Yoji, 5,009,094, Cl. 72-225.000

KB Lighting, Inc. *See*—
Weber, Walter K., 5,009,325, Cl. 220-374.000

Keil, Michael, Schirmer, Ulrich, Kast, Juergen, Kolassa, Dieter, Wuerzer, Bruno, Meyer, Norbert, Rademacher, Wilhelm, Jung, Johann, and Carlson, Dale R., to BASF Aktiengesellschaft Cyclohexenone compounds and use as herbicides or as plant growth regulators 5,009,702, Cl. 71-100.000

Kelkenberg, Heike, Ruback, Wulf, and Engel, Klaus, to Huls Aktiengesellschaft Use of n-polyhydroxyalkyl fatty acid amides as thickening agents for liquid aqueous surfactant systems 5,009,814, Cl. 252-548.000

Keller, John A., Traylor, Barry S., and Tickner, Robert H., to Unisys Corp. Multi-event mechanism for queuing happened events for a large data processing system 5,010,482, Cl. 364-200.000

Keller, Reinhold *See*—
Wullbrandt, Dieter, Keller, Reinhold, Schlingmann, Merten, Holla, Wolfgang, and Schneider, Manfred, 5,010,012, Cl. 435-280.000

Kelley, Joseph M., Kucher, Donald C., and Mayurnik, George, to International Dioxcide, Inc. Process of preparing clorine dioxide and apparatus therefor 5,009,875, Cl. 423-477.000

Kelly, John W., to Haskel, Inc. Method for radially expanding and anchoring sleeves within tubes 5,009,002, Cl. 29-890.031

Kelly, Kenneth C., to Hughes Aircraft Company Slot radiator assembly with vane tuning 5,010,351, Cl. 343-771.000

Kendall Company, The *See*—
Steigerwald, Carl J., 5,009,391, Cl. 251-149.100
Wortley, Ronald W., and Beattie, David C., 5,009,636, Cl. 604-43.000

Kenny, Thomas J., to Westinghouse Electrical Corp. Sampled digital filter system 5,010,507, Cl. 364-724.010

Kensinger, Jesse P. *See*—
Langenbeck, Keith A., and Kensinger, Jesse P., 5,009,053, Cl. 53-58.000

Keough, Laurence J., to Pitney Bowes Inc. Sorting system for organizing randomly ordered route grouped mail in delivery order sequence 5,009,321, Cl. 209-3.100

Kepplinger, Leopold W *See*—
Glockler, Gerhard, Muller, Heinz, Kepplinger, Leopold W., Matzawrakos, Panajiotis, Koch, Erwin, and Auberger, Heinrich, 5,009,397, Cl. 266-197.000

Kernforschungsanlage Julich GmbH *See*—
Boden, Karl, Ibach, Harald, and Linke, Udo, 5,009,865, Cl. 422-249.000

Kernosky, Stephen K *See*—
Bilsbury, Stephen J., Dennis, William G., Jr. and Kernosky, Stephen K., 5,009,166, Cl. 102-516.000

Kerr, E. Michael, Connelly, Lawrence J., Roe, William J., and Vallowe, Robert M., to Nalco Chemical Company Crystal modification in wet process phosphoric acid production 5,009,873, Cl. 423-320.000

Kerr-McGee Corporation *See*—
Nelson, Stephen R., and Hood, Richard I., 5,009,772, Cl. 208-309.000

Kersh, David V., III *See*—
Norwood, Roger D., and Kersh, David V., III, 5,010,260, Cl. 307-482.100

Kesselman, Martin *See*—
Giangano, David A., Kesselman, Martin, Boeskor, Steven, and Celona, Anthony R., 5,010,339, Cl. 341-164.000

Kessler, David L *See*—
Esola, John L., and Kessler, David L., 5,009,245, Cl. 137-116.500

Ketterman, Sylvan R., to General Motors Corporation Vehicle lamp ventilation system 5,010,453, Cl. 362-61.000

Keyes, Denis E *See*—
Aronoff, Marvin S., Keyes, Denis E., and Hahn, Robert C., Sr., 5,009,648, Cl. 604-332.000

Keymling, Michael, to Fresenius, AG Gastric/duodenal/jejunal catheter for percutaneous enternal feeding 5,009,639, Cl. 604-96.000

Khandaghabadi, Farrokh *See*—
Coppola, Richard, and Khandaghabadi, Farrokh, 5,010,335, Cl. 340-870.280

Khelifa, Noureddine *See*—
Schwetje, Norbert, Sizmann, Rudolf, and Khelifa, Noureddine, 5,009,071, Cl. 62-4.000

Khromyak, Nikolai T *See*—
Paton, Boris E., Utkin, Vladimir F., Nedoseka, Anatoly Y., Khromyak, Nikolai T., Gorlitsyn, Nikolai V., Tikhy, Viktor G., Mezintsev, Evgeny D., and Mezhuev, Nikolai N., 5,010,503, Cl. 364-569.000

Kida, Michio, Arai, Yoshiaki, and Sahira, Kensho, to Mitsubishi Kinzoku Kabushiki Kaisha Apparatus and process for growing crystals of semiconductor materials 5,009,862, Cl. 422-249.000

Kienzler, Dieter *See*—
Grob, Ferdinand, Kienzler, Dieter, Linder, Ernst, Potschin, Roger, and Stutzenberger, Heinz, 5,009,064, Cl. 60-276.000

Kigami, Takeo *See*—
Morinaga, Akio, and Kigami, Takeo, 5,010,132, Cl. 524-601.000

Kihara, Hisashi *See*—
Utsugi, Nobuo, Kihara, Hisashi, Mori, Shuichi, Fuse, Junichi, Miyake, Takashi, and Ikata, Yoshikatsu, 5,010,437, Cl. 360-137.000

Kijima, Takao, Edahiro, Takeshi, Koyama, Toshihide, and Taniguchi, Haruyuki, to Mazda Motor Corporation Vehicle suspension system 5,009,448, Cl. 280-673.000

Kikuta, Hikaru *See*—
Hanai, Kazumichi, Mine, Koichi, and Kikuta, Hikaru, 5,009,575, Cl. 417-244.000

Kikuyama, Hirohisa *See*—
Ohmi, Tadahiro, Miki, Masahiro, Kikuyama, Hirohisa, and Maeno, Matagoro, 5,009,963, Cl. 428-472.200

Killinger, Erich, to Dambach-Werke GmbH Warning light device 5,010,319, Cl. 340-472.000

Kim, Jeong Y., to Sang Wook Suh International Output control circuit of a 4-burner electronics induction heating cook system and a control method thereof 5,010,223, Cl. 219-10.770

Kim, Sun H., and Moreau, Sylviane, to Biomeasure, Inc. CCK antagonists and their use in treating gastrointestinal disorders. 5,010,089, Cl. 514-314.000

Kim, Tai K., and Vanderpool, Clarence D., to GTE Products Corporation. Method for removing organic and tungsten from sodium sulfate solution. 5,009,788, Cl. 210-639.000

Kimball, Donald B., Jr. *See*—
Kruse, Jurgen M., and Kimball, Donald B., Jr., 5,010,125, Cl. 524-308.000

Kimberly-Clark Corporation *See*—
Bernardin, Leo J., 5,009,650, Cl. 604-378.000
Hossain, Shafi U., and Blaney, Carol A., 5,009,745, Cl. 162-5.000
Hossain, Shafi U., and Blaney, Carol A., 5,009,746, Cl. 162-5.000

Kimijima, Masami. *See*—
Nakamura, Kosei, Kono, Shinichi, Numai, Kazuhisa, and Kimijima, Masami, 5,010,286, Cl. 318-571.000

Kimura, Kenji. *See*—
Tsuji, Kiyoshi, and Kimura, Kenji, 5,010,395, Cl. 358-44.000

Kimura, Hiroshi. *See*—
Yamaguchi, Hiroshi, and Yamaguchi, Masashi, 5,009,063, Cl. 57-124.000

Kimura, Tomohiro. *See*—
Honda, Mitsuru, Koike, Atsushi, Kimura, Tomohiro, Ogawa, Kyosuke, and Murai, Keiichi, 5,009,974, Cl. 430-69.000

Kinetic Concepts, Inc. *See*—
Vrzalik, John H., 5,008,965, Cl. 5-61.000

King, Raymond A., to B&W Fuel Company. Nuclear fuel assembly bottom nozzle plate. 5,009,839, Cl. 376-352.000

Kingsley, Jeffery P. *See*—
Weise, Mark K., Kingsley, Jeffery P., and Litz, Lawrence M., 5,009,816, Cl. 261-21.000

Kinjoh, Naoto. *See*—
Murakami, Tokumichi, Asai, Kohtaro, Kamizawa, Koh, Nishida, Masami, Yamazaki, Eizo, Itoh, Atsushi, and Kinjoh, Naoto, 5,010,401, Cl. 358-136.000

Kinkade, Charles E., Sharp, Harold L. and Vrbensky, Robert F., to General Motors Corporation. Transmission shifter to operator controlled mechanism interlock. 5,009,295, Cl. 192-4.00A

Kinoshita, Jiro. *See*—
Kurakake, Mitsuo, and Kinoshita, Jiro, 5,010,492, Cl. 364-474.290

Kinoshita, Kitoshi and Aoki, Hiroatsu, to Fujitsu Limited. Optical module and method of manufacturing same. 5,009,481, Cl. 350-96.180

Kinoshita, Masakatsu. *See*—
Yamanaka, Masahiko, Hanaoka, Motoyoshi, Konse, Hiroaki, Shigeno, Haruhisa, and Kinoshita, Masakatsu, 5,009,936, Cl. 427-407.100

Kinoshita, Takao, Tojo, Akihiko, Takayama, Tsutomu, Kaji, Toshio, and Tanaka, Nobuyoshi, to Canon Kabushiki Kaisha. Image pick-up device. 5,010,418, Cl. 358-335.000

Kinoshita, Tuneo. *See*—
Hikita, Mitsutaka, Sumioka, Atsushi, Tabuchi, Toyoji, Kurosawa, Kazuhito, and Kinoshita, Tuneo, 5,010,269, Cl. 310-313.00B

Kintz, Karl A. *See*—
Liang, Rong-Chang, Colyer, Emerson K., Chen, Jing-Den, Kintz, Karl A. and Suen, Chih-Her, 5,010,114, Cl. 521-109.100

Kinugawa Rubber Industrial Co., Ltd. *See*—
Hasegawa, Minekazu, Ikeda, Kenichi, and Fujihira, Junichi, 5,009,464, Cl. 296-213.000

Kippenhan, B. William, and Maholick, Andrew W., to International Business Machines Corporation. Structured fields at a data stream boundary for delimiting files. 5,010,514, Cl. 364-900.000

Kira, Akihiko. *See*—
Ametani, Minoru, Funakoshi, Keigo, Kira, Akihiko, Matsushita, Takao, and Shirakura, Keizo, 5,009,735, Cl. 156-241.000

Kirchhof, Rolf, to U.S. Philips Corporation. Method of adjusting a printing gap in a printer. 5,009,526, Cl. 400-56.000

Kirihara, Tomoo, Nakagawa, Ippei, Seki, Yoshinobu, Honda, Yutaka, and Ichihara, Yasuo, to Mitsubishi Nuclear Fuel Company, Ltd. Process for separation of hafnium tetrachloride from zirconium tetrachloride. 5,009,751, Cl. 204-61.000

Kirihata, Fumiaki. *See*—
Haruki, Hiromu, Kirihata, Fumiaki, and Hashimoto, Osamu, 5,010,384, Cl. 357-38.000

Kiryu, Naohiko. *See*—
Maruyama, Hiroshi, Kiryu, Naohiko, Minezaki, Etsuko, Tagashira, Susumu, and Shimokawahara, Hisashi, 5,009,944, Cl. 428-40.000

Kishi, Tomomi. *See*—
Sato, Kazuhiro, Kishi, Tomomi, Umeda, Koji, Uchida, Yasushi and Takeuchi, Masahiko, 5,010,226, Cl. 219-81.000

Kist, William J. Animal trap with sanitary handling means. 5,009,317 Cl. 206-466.000

Kistler Instrumente AG. *See*—
Kubler, John M., and Insalaco, Michael D., 5,009,106, Cl. 73-651.000

Kita, Jean-Claude, Puff, Roger M., Petrovic, Alexandre, and Chretien, Marcel, to Charbonnages de France. Cooled fluidization grid. 5,009,852, Cl. 422-143.000

Kitada, Masahiro, Shimizu, Noboru, Tanabe, Hideo, and Nakamura, Hitoshi, to Hitachi, Ltd. Magnetoresistive magnetic head having a shunt film of Nb. 5,010,433, Cl. 360-113.000

Kitajima, Kimio, and Kiuchi, Hiroyuki, to Sankyo Seiki Mfg. Co., Ltd. Motor control circuit. 5,010,283, Cl. 318-373.000

Kitamura, Keiji. *See*—
Koyama, Akihiro, Kitamura, Keiji and Yamamoto, Nobuyuki, 5,010,041, Cl. 501-4.000

Kitamura, Koichiro, to Kitamura Machinery Co., Ltd. Tool holder for machine tool. 5,009,555, Cl. 409-232.000

Kitamura Machinery Co., Ltd. *See*—
Kitamura, Koichiro, 5,009,555, Cl. 409-232.000

Kitao, Shiei. *See*—
Yamada, Shinjiro, Satoh, Seiki, Mabuchi, Kazuichi, Kitao, Shiei and Egawa, Yoshiaki, 5,010,264, Cl. 310-72.000

Kitzberger, Herbert. *See*—
Gugel, Bernd, Kaufmann, Clemens, Kitzberger, Herbert, and Rohrer, Kurt, 5,009,529, Cl. 400-124.000

Kiuchi, Hiroyuki. *See*—
Kitajima, Kimio, and Kiuchi, Hiroyuki, 5,010,283, Cl. 318-373.000

Kiyoshi, Yamada. *See*—
Masasumi, Yana, Hitoshi, Nagato, Kiyoshi, Yamada, Shyoji, Ueno and Kunihiro, Shibuya, 5,009,527, Cl. 400-120.000

Klaassens, J. Ben, Lauw, Hian K., and de Beer, Freddy, to Erijouf, Robert F. Three-phase AC-to-AC series resonant power converter with reduced number of switches. 5,010,471, Cl. 363-160.000

Klein, David C. Test tube cassette system and cassettes for use therein. 5,009,316, Cl. 206-443.000

Kleinschmit, Peter. *See*—
Deschler, Ulrich and Kleinschmit, Peter, 5,010,203, Cl. 548-110.000

Klemen, Donald. *See*—
Ordo, James P., Raszkowski, James A., and Klemen, Donald, 5,009,116, Cl. 74-331.000
Raszkowski, James A., and Klemen, Donald, 5,009,118, Cl. 74-331.000

Klepsch, Wilhelm, and Plobst, Dietmar, to Senoplast Klepsch & Co. Insulating wall for refrigerator devices. 5,009,952, Cl. 428-319.100

Kleschick, William A. *See*—
Van Heertum, John C., Gerwick, Ben C., III, and Kleschick William A., 5,010,195, Cl. 544-263.000

Klett, Paul A., Bakhshi, Shiv K., and Stahl, Steven B., to Owens-Corning Fiberglas Corporation. Method and apparatus for impregnating a porous substrate with foam. 5,009,932, Cl. 427-243.000

Kline, Loren H., Sherwin, Harry A., and Telep, Robert J., to Coltec Industries Inc. Control module having multiple solenoid actuated valves. 5,009,250, Cl. 137-596.170

Klok, Richard J. *See*—
Rue, Charles V., van de Merwe, Ronald H., Bauer, Ralph, Pellow, Scott W., Cottringer, Thomas E., and Klok, Richard J., 5,009,676, Cl. 51-309.000

Klotz, Gernot. *See*—
Lindel, Hans, Hallenbach, Werner, Berschauer, Friedrich, Greife Heinrich, and Klotz, Gernot, 5,010,091, Cl. 514-357.000

Knabenhans, Fritz. *See*—
Waeber, Rene, Knabenhans, Fritz and Bachmann, Othmar, 5,008,978, Cl. 19-66.00C

Knighton, Nigel J. *See*—
Storrow, Alan J., and Knighton, Nigel J., 5,010,444, Cl. 361-386.000

Knop, Albert W., and van Banning, Robert J. H. M., to Rockwool Lapinus B.V. Grow-mat for cultivating plants and a method for manufacturing same. 5,009,031, Cl. 47-64.000

Knopp, John V. Eigenvector synthesizer. 5,009,143, Cl. 84-604.000

Knorr, Andreas. *See*—
Henning, Rolf, Benz, Gunter, Stasch, Johannes-Peter, Knorr Andreas, and Bender, Wolfgang, 5,010,057, Cl. 514-018.000

Knudson, Steven B., to Advance Display Technologies, Inc. Image transfer device and method of manufacture. 5,009,475, Cl. 350-96.100

Kobari, Tadaomi, to Alpine Electronics Inc. Printed circuit board 5,010,448, Cl. 361-403.000

Kobayahsi, Hirokazu. *See*—
Katou, Hiromi and Kobayahsi, Hirokazu, 5,010,549, Cl. 370-110.100

Kobayashi, Kazuo, Morikawa, Kiyoshi, Yamada, Yoshinori Kurumada, Masakazu, and Sugihara, Masanori, to Pioneer Electronic Corporation. Disc guide mechanism for automotive disc player 5,010,484, Cl. 369-77.200

Kobayashi, Masanobu. *See*—
Maeno, Yoshinori, Kobayashi, Masanobu, and Oishi, Kayoko, 5,009,762, Cl. 204-192.160

Kobayashi, Takashi. *See*—
Harada, Kinji, Ikeda, Kyoichi, Kuwayama, Hideki, Kobayashi, Takashi, Nishikawa, Tadashi, Watanabe, Tetsuya, and Yoshida, Takashi, 5,009,108, Cl. 73-704.000

Kobayashi, Yoshiharu. *See*—
Sato, Shuichi, Koguchi, Yoshimi, and Kobayashi, Yoshiharu, 5,009,177, Cl. 112-292.000

Kobylarz, Daniel F., and Ford, David K., to Motorola, Inc. Method for active feedback suppression. 5,010,570, Cl. 379-390.000

Koch, Edmund, and Pruss, Dieter, to Dragerwerk Aktiengesellschaft. Mirror arrangement for a beam path in a multiple-reflection measuring cell. 5,009,493, Cl. 350-619.000

Koch, Erwin. *See*—
Glockler, Gerhard, Muller, Heinz, Kepplinger, Leopold W., Matzawrakos, Panajiotis, Koch, Erwin, and Auberger, Heinrich, 5,009,397, Cl. 266-197.000

Koch Industries, Inc. *See*—
Elias, Samir F., and Morrison, Daryl K., 5,010,129, Cl. 524-413.000

Koch, Peter. *See*—
Reich, Harry, and Koch, Peter, 5,009,643, Cl. 604-165.000

Koch, Roger H. *See*—
Hartstein, Allan M., and Koch, Roger H., 5,010,512, Cl. 364-807.000

Koegel, Keith S. *See*—
Fogg, Michael W., Koegel, Keith S., Shuey, John R., Zelko, William E., and Beamenderfer, Robert E., 5,009,614, Cl. 439-497.000

Koelle, William H. *See*—
Wilmott, James M.; Koelle, William H., and Znaiden, Alexander P., 5,010,110, Cl. 514-758.000

Koga, Shigeyuki, and Sugiue, Shigeki, to Kabushiki Kaisha Toyoseikusho. Method for and apparatus of thermal treatment of human waste. 5,009,172, Cl. 110-242.000

Kogelnik, Herwig W. *See*—
Alferness, Rodney C.; Budrikis, Zigmantas L.; Hagelbarger, David W., Kogelnik, Herwig W., and Netravali, Arun N., 5,009,477, Cl. 350-96.150.

Koguchi, Yoshimi. *See*—
Sato, Shuichi, Koguchi, Yoshimi, and Kobayashi, Yoshiharu, 5,009,177, Cl. 112-292.000

Kohl, Peter. *See*—
Wullenweber, Heinz, Kohl, Peter, Jung, Herbert, Borchardt, Jurgen, Bickle, Wolfgang, and Braus, Jurgen, 5,010,050, Cl. 502-301.000

Kohler, Burkhard; and Meyer, Rolf-Volker, to Bayer Aktiengesellschaft. Polyarylene sulphide containing phosphine groups. 5,010,169, Cl. 528-388.000

Kohno, Tetsushi. *See*—
Morimoto, Yoshihiko, and Kohno, Tetsushi, 5,009,127, Cl. 74-866.000
Morimoto, Yoshihiko, and Kohno, Tetsushi, 5,009,129, Cl. 74-866.000

Kohsaka, Masaki, Higashi, Isaburou, Akana, Yoshinori; Hashimoto, Mikio; and Yatsu, Tadao, to Mitsui Petrochemical Industries, Ltd. Polyester carbonate copolymers, processes for preparing same and polyester resin compositions containing said copolymers. 5,010,146, Cl. 525-439.000.

Koike, Atsushi. *See*—
Honda, Mitsuru, Koike, Atsushi, Kimura, Tomohiro, Ogawa, Kyosuke, and Murai, Keiichi, 5,009,974, Cl. 430-69.000

Koike, Seiji, to Tokyo Electric Co., Ltd. Color ink ribbon and printer using this ribbon. 5,009,531, Cl. 400-240.300

Kojima, Hiroyasu. *See*—
Harano, Takeshi, Takaki, Satoru, Shigesato, Yuzo, Suzuki, Koichi, Hashimoto, Naoki, Kojima, Hiroyasu, and Oyama, Takuji, 5,009,922, Cl. 427-37.000

Kojima, Keiji. *See*—
Mishina, Yusuke; and Kojima, Keiji, 5,010,483, Cl. 364-200.000

Kojima, Kunio. *See*—
Fuji, Hiroshi, Fujiwara, Tsuneo, Iwaki, Takashi; Numata, Tomiyuki, Tsuji, Kentaroh, Maeda, Shigemi, Yamaguchi, Takeshi, Kojima, Kunio; Deguchi, Toshihisa, and Terashima, Shigeo, 5,010,540, Cl. 369-50.000

Kojima, Yoshitaka. *See*—
Iizuka, Nobuyuki, Hirose, Fumiyuki; Asahi, Naotatsu, and Kojima, Yoshitaka, 5,009,070, Cl. 60-753.000

Kokusai Denshin Denwa Co., Ltd. *See*—
Nishimura, Kohsuke, and Sakai, Kazuo, 5,010,376, Cl. 357-17.000

Kolassa, Dieter: *See*—
Keil, Michael, Schirmer, Ulrich, Kast, Juergen, Kolassa, Dieter, Wuerzer, Bruno, Meyer, Norbert; Rademacher, Wilhelm, Jung, Johann, and Carlson, Dale R., 5,009,702, Cl. 71-100.000

Kolta, Peter. *See*—
Krebser, Werner, Lantos, Michael, and Kolta, Peter, 5,010,452, Cl. 362-19.000

Komabayashi, Masashi; Kuramochi, Kunio, and Hijikata, Kenichi, to Mitsubishi Metal Corporation. Thermoelectric element and method of manufacturing same. 5,009,717, Cl. 136-201.000

Komakine, Shigeo. *See*—
Horii, Masami, Komakine, Shigeo, Ochiai, Kuniaki, and Kondoh, Takashi, 5,009,528, Cl. 400-124.000

Komatsu, Osamu. *See*—
Noda, Hidetoshi, Gocho, Makoto; Shimizu, Masayasu, Komatsu, Osamu, and Inoue, Hideaki, 5,009,707, Cl. 75-375.000

Komatsu, Takahiro: *See*—
Inoue, Yoshinori; Kumanoya, Masaki, Komatsu, Takahiro, Konishi, Yasuhiro; and Dosaka, Katsumi, 5,010,259, Cl. 307-482.000

Komiya, Ryohei. *See*—
Yamamoto, Takemi; Nagata, Osamu; Komiya, Ryohei; Sakai, Jun, and Ban, Yoshiyuki, 5,010,360, Cl. 355-20.000

Kondo, Masao. *See*—
Ishida, Takashi; and Kondo, Masao, 5,009,145, Cl. 84-612.000

Kondo, Tomoji. *See*—
Kawakami, Toshikatsu, Fukuda, Shin, Shinbo, Hiroyasu, Unemura, Toyoaki, Sakamoto, Ken, and Kondo, Tomoji, 5,010,406, Cl. 358-147.000

Kondoh, Takashi. *See*—
Horii, Masami, Komakine, Shigeo, Ochiai, Kuniaki, and Kondoh, Takashi, 5,009,528, Cl. 400-124.000

Konica Corporation. *See*—
Maekawa, Yoshikazu, and Hirata, Tetsuo, 5,010,364, Cl. 355-207.000
Matsubara, Shinichi, Uehara, Masafumi, Bunya, Shinichi, and Katahashi, Eriko, 5,009,981, Cl. 430-175.000.
Murahashi, Takashi, Nakazawa, Toshihiko, Takesue, Toshihiro, and Motoi, Toshihiro, 5,010,353, Cl. 346-108.000
Yagi, Toshihiko, and Yamada, Yoshitaka, 5,009,988, Cl. 430-505.000

Konishi, Yasuhiro. *See*—
Inoue, Yoshinori, Kumanoya, Masaki, Komatsu, Takahiro, Konishi, Yasuhiro, and Dosaka, Katsumi, 5,010,259, Cl. 307-482.000

Kono, Shinichi. *See*—
Nakamura, Kosei, Kono, Shinichi, Numai, Kazuhisa, and Kimijima, Masami, 5,010,286, Cl. 318-571.000

Konse, Hiroaki. *See*—
Yamanaka, Masahiko, Hanaoka, Motoyoshi, Konse, Hiroaki, Shigeno, Haruhisa, and Kinoshita, Masakatsu, 5,009,936, Cl. 427-407.100

Koppensteiner, Alfred. *See*—
Iossi, Daryl R., Cook, Lacy G., and Koppensteiner, Alfred, 5,009,494, Cl. 350-620.000

Korber AG. *See*—
Heitmann, Uwe, 5,009,238, Cl. 131-108.000

Koshika, Tomohito. *See*—
Watanabe, Taichi, Ogino, Hidekazu, Hirota, Hajime, Koshika, Tomohito, Moriya, Naoko, and Nozaki, Toshio, 5,009,813, Cl. 252-545.000.

Kosin, John A., Mooney, Gerry, Tarquini, Michael A., and Garcia, Rod A., to J. M. Huber Corporation. High temperature endothermic blowing agents compositions and applications. 5,009,809, Cl. 252-350.000

Kosin, John A. *See*—
Wason, Satish K., Mooney, Gerry, Andrews, Claude R., Tarquini, Michael E., Kosin, John A., and Garcia, Rod A., 5,009,810, Cl. 252-350.000

Koski, Greg, to R.W. Technology, Inc. Plastic-rubber composites 5,010,122, Cl. 524-80.000

Kosugi, Yoshitsugu, Tanaka, Hideoki, Suzuki, Hideo, and Shiraki, Masaru, to Agency of Industrial Science & Technology, and Ministry of International Trade & Industry. Method for continuous reaction with fluidized immobilized lipase. 5,010,004, Cl. 435-134.000

Kotecki, Jeffrey D. *See*—
Raikes, Terry E., Kramer, William L., Howard, John H., Moore, Wayne D., Jackson, Louis, and Kotecki, Jeffrey D., 5,009,276, Cl. 177-25.150

Kotera, Nobukazu. *See*—
Yatsuka, Takeshi, Murata, Hiroshi, Mizumura, Yutaka, and Kotera, Nobukazu, 5,009,960, Cl. 428-423.100

Kotobuki & Co., Ltd. *See*—
Kageyama, Hidehei, 5,009,533, Cl. 401-65.000

Kouno, Tomomitsu, Hatano, Hideki, Yamaji, Takashi, Ootaki, Sakashi, and Nishida, Masami, to Pioneer Electronic Corp. Photo-conductive liquid crystal light valve. 5,009,490, Cl. 350-342.000

Kouzuki, Hiroyuki. *See*—
Naito, Yasuo, Kouzuki, Hiroyuki, and Murai, Takeshi, 5,010,490, Cl. 364-426.040

Kovacs, Richard C., Krambeck, Frederick J., and Sarli, Michael S., to Mobil Oil Corporation. Fluid catalytic cracking regeneration with reduction of nitrogen oxide. 5,009,853, Cl. 422-144.000

Kowdley, Balasubramanian S. *See*—
Richardson, David L., Clark, Jack P., Kowdley, Balasubramanian S., Patterson, Peter M., Perry, Richard W., and Smith, Thurman D., 5,009,105, Cl. 73-621.000

Koyama, Akihiro; Kitamura, Keiji, and Yamamoto, Nobuyuki, to Nippon Sheet Glass Co., Ltd. Colored low-expansion transparent glass ceramic. 5,010,041, Cl. 501-4.000

Koyama, Toshihide. *See*—
Kijima, Takao, Edahiro, Takeshi, Koyama, Toshihide, and Taniguchi, Haruyuki, 5,009,448, Cl. 280-673.000

Kozikowski, Barbara A. *See*—
Degenhardt, Charles R., and Kozikowski, Barbara A., 5,009,882, Cl. 424-52.000

Kozuki, Susumu. *See*—
Yasumura, Hiroto, Hirasawa, Masahide, Noji, Minoru, Kozuki, Susumu, Takahashi, Koji, and Yoshimura, Katsuji, 5,010,416, Cl. 358-314.000

Kraft General Foods, Inc. *See*—
Kratochvil, John F., 5,009,867, Cl. 426-128.000
Wiant, Matthew J., Lynch, William R., and LeFreniere, Robert C., 5,009,917, Cl. 426-631.000

Krambeck, Frederick J. *See*—
Kovacs, Richard C., Krambeck, Frederick J., and Sarli, Michael S., 5,009,853, Cl. 422-144.000

Kramer, William J. Packaging carton. 5,009,320, Cl. 206-607.000

Kramer, William L. *See*—
Raikes, Terry E., Kramer, William L., Howard, John H., Moore, Wayne D., Jackson, Louis, and Kotecki, Jeffrey D., 5,009,276, Cl. 177-25.150.

Kramer, Wolfgang, Weissmuller, Joachim, Berg, Dieter, Brandes, Wilhelm, and Dutzmann, Stefan, to Bayer Aktiengesellschaft. Pesticidal aminomethylheterocyclic compounds. 5,010,101, Cl. 514-462.000

Kramer, Wolfgang, Jautelat, Manfred, and Kranz, Eckart, to Bayer Aktiengesellschaft. Novel alkylcycloalkyl-triazolylmethyl ketones as fungicide intermediates. 5,010,208, Cl. 548-267.800.

Kranz, Eckart. *See*—
Kramer, Wolfgang, Jautelat, Manfred, and Kranz, Eckart, 5,010,208, Cl. 548-267.800

Kratochvil, John F., to Kraft General Foods, Inc. C-gel composite pizza snack kit. 5,009,867, Cl. 426-128.000

Krauss, Owen T. *See*—
Gruber, Norman G., and Krauss, Owen T., 5,009,100, Cl. 73-155.000

Krebser, Werner, Lantos, Michael, and Kolta, Peter, to Harmer GmbH Gesellschaft fur den Vertrieb medizinischer und technischer Gerate

Therapeutic lamp for biostimulation with polarized light 5,010,452, Cl 362-19 000)
Krempl, Peter W Wegscheider, Guenther, and Woess, Gerhard, to AVL Gesellschaft fuer Verbrennungs kraftmaschinen und Messtechnik m b H, Prof Dr Dr hc Hans List Charge amplifier circuit 5,010,302, Cl 330-107 000)
Krenz, Horst M, to Zenith Data Systems Corporation Installation mechanism for removable computer drive module 5,010,426, Cl 360-97 010.
Kreuter, Volker See—
Gansauge, Peter, Kreuter, Volker and Schettler, Helmut 5,010,389, Cl 357-67 000
Kreuzer, Franz-Heinrich See—
Wenski, Guido, Maier, Ludwig, and Kreuzer, Franz-Heinrich, 5,009,934, Cl 427-387 000.
Kromrey, Robert V, to United Technologies Corporation Method of molding a composite article using softened glass as a pressure transmitting medium 5,009,687, Cl 65 18 100
Kromrey, Robert V, to United Technologies Corporation Method of molding a carbon-carbon composite 5,009,823, Cl 264-29 700
Kronfli, Esam, Lovell, Keith V, Hooper, Alan, and Neat, Robin J, to United Kingdom Atomic Energy Authority Polymer electrolytes 5,009,970, Cl 429-192 000
Kruck, Richard W, Cur, Omer N, Leclear, Douglas D, Kuehl, Steven J, and Burn, Ralph R, to Whirlpool Corporation Modular mechanical refrigeration unit 5,009,081, Cl 62-264 000
Kruessel, Bernhard, to Karl H Sengewald KG Method and device for joining foil hoses 5,009,632, Cl 493-189 000
Krumb, Heinrich W See—
Reichman, Karl-Heinz, and Krumb, Heinrich W, 5,010,456, Cl 362-61 000
Kruse, Heinz-Josef See—
Sippel, Achim; Kruse, Heinz-Josef; and Becker, Wilfried 5,009,167, Cl 102 524 000
Kruse, Jurgen M and Kimball, Donald B Jr, to XAAR Limited Room temperature plain paper ink 5,010,125, Cl 524-308 000
Kruse, Rodger C See
Scholsky, Kevin M, Larsen, Lisa M, and Kruse, Rodger C, 5,010,166, Cl 528-323 000
Ku, San-Mei, and Perry, Kathleen A Method of forming contacts to a semiconductor device 5,010,039, Cl 437-228 000
Kubler, John M and Insalaco, Michael D, to Kistler Instrumente AG Accerlerometer with improved shock resistance 5,009,106, Cl 73-651 000
Kubo, Kazuhito See—
Oshima, Etsuo, Obase, Hiroyuki, Karasawa, Akira, Kubo, Kazuhito, Miki, Ichiro, and Ishii, Akio, 5,010,087, Cl 514-307 000
Oshima, Etsuo, Obase, Hiroyuki, Karasawa, Akira, Kubo, Kazuhito, Miki, Ichiro, and Ishii, Akio, 5,010,104, Cl 514-510 000.
Kubo, Shinji See
Yoshida, Keiji, Funato, Ryo, Takahiro, Syun, Kubo, Shinji, and Inagaki, Noboshi, 5,009,978, Cl 430-109 000
Kubota Ltd See—
Machida, Satoshi, and Hattori, Akio, 5,009,125, Cl 74-606 00R
Kubota, Toshiaki See—
Naganuma, Hiroshi, Sato, Kenji, Yamamoto, Masashi, Kubota, Toshiaki, Hayashi, Hiroshige, and Ishizaka, Yoshirou, 5,009,080, Cl 62-256 000
Kucher, Donald C See—
Kelley, Joseph M, Kucher, Donald C, and Mayurnik, George, 5,009,875, Cl 423-477 000
Kuchta, Richard, to Gerber Garment Technology Inc Track expander and method of use 5,009,168, Cl 104-172 100
Kudo, Yasunori See—
Akizawa, Nobuyuki, Kudo, Yasunori, Kanai, Toshiyuki, Kamei, Yasuo, Oyama, Nobuaki, and Negishi, Akihito, 5,009,355, Cl 227-114 000
Kudou, Osamu See—
Kushida, Kazumitsu, Kudou, Osamu, Ogawa, Sumitaka, and Uike, Hiroshi, 5,009,211, Cl 123-491 000
Kuehl, Steven J See—
Kruck, Richard W, Cur, Omer N, Leclear, Douglas D, Kuehl, Steven J, and Burn, Ralph R, 5,009,081, Cl 62-264 000
Kugimiya, Shuzo See—
Suzuki, Hiroshi, Shiotani, Shinobu, Tokunaga, Shinji, Hirai, Tokuyuki, Fukumochi, Yoji, Kugimiya, Shuzo, and Sata, Ichiko, 5,010,486, Cl 364-419 000
Kuhara, Takashi Device for providing communication between water tanks of heat accumulation tank system 5,009,261, Cl 165-96 000
Kuhl, Virgil F and Noll, Guenter, to Motorola, Inc Clip assembly 5,008,908, Cl 24-510 000
Kuki, Nobuyuki, Isomura, Yukio, Suzumura, Hirokazu, Sakakibara, Yoshikazu, and Ishihara, Hiroshi, to Aisin Seiki Kabushiki Kaisha Window regulator apparatus 5,009,035, Cl 49-352 000
Kulas, John L See—
Manic, Milan, and Kulas, John L, 5,009,271, Cl 175 53 000
Kulkarni, Padmakar V See
Shah, Vipin D, Kulkarni, Padmakar V, and Miranda, Quirinus R, 5,009,997, Cl 435-7 400
Kulkarni, Padmaker V See—
Shah, Vipin D, Kulkarni, Padmaker V, and Miranda Quirinus R, 5,009,996, Cl 435-7 000
Kulzer & Co GmbH See—

Lehtoluoma, Teuvo *See*—
Maenpaa, Matti, Lehtoluoma, Teuvo, Henttinen, Kauko, Jokipalo, Pertti, Saren, Aimo, and Pirinen, Seppo, 5,009,096, Cl. 72-239.000

Leitz, Edgar *See*—
Eckel, Thomas, Leitz, Edgar, Wittmann, Dieter, Ott, Karl-Heinz, Peters, Horst, and Schoeps, Jochen, 5,010,135, Cl. 525-63.000

Leland Stanford Junior University, Board of Trustees of the *See*—
Zare, Richard N., Huang, Xiaohua, and Ohms, Jack I., 5,009,760, Cl. 204-183.300

Lemoyne, Remi *See*—
Clairouin, Noel, Gueroult, Alain, and Lemoyne, Remi, 5,009,918, Cl. 426-643.000

Leonard, David W., Sr. *See*—
Hilbish, Brian K., Leonard, David W., Sr., Burgess, Arnold C., and Burns, David R., 5,009,550, Cl. 406-87.000

Leonard, Donald A. and Sweeney, Harold E., to GTE Government Systems Corporation, Remote method of measuring subsurface water temperatures, 5,009,500, Cl. 356-43.000

Leonard, Thomas A. *See*—
Murphy, Martin J., Jr., Stubbs, Jack B., and Leonard, Thomas A., 5,009,503, Cl. 356-339.000

Lepinoy, Dominique, to Lepinoy Industrie, Method, device and padded product for maintaining an object, 5,009,318, Cl. 206-524.800

Lepinoy Industrie *See*—
Lepinoy, Dominique, 5,009,318, Cl. 206-524.800

LePisto, Matti, Ilmanen, Reijo, Karlsson, Markku, and Laakso, Sauli, to Valmet Oy, Method for on-machine coating-drying of a paper web or the like, 5,009,016, Cl. 34-41.000

Lepow, Joyce, Sheet for foam sofa bed, 5,008,966, Cl. 5-496.000

Lescaut, Pierre L., to Atochem, Method of joining pipes at their ends to form a pipeline, 5,009,737, Cl. 156-264.000

Lesher, George Y., deceased (by Lesher, Louise E., executrix), Bacon, Edward R., Singh, Baldev, and Kuo, Gee-Hong, to Sterling Drug Inc., Imidazopyridines, compositions and use, 5,010,086, Cl. 514-303.000

Lesher, Louise E., executrix *See*—
Lesher, George Y., deceased, Bacon, Edward R., Singh, Baldev, and Kuo, Gee-Hong, 5,010,086, Cl. 514-303.000

Lesa, Jacques, Perreau, Philippe, Bary, Daniel, and Grard, Guy, to Institute Francais du Petrole, Device and method for measuring the deformations of a sample, 5,009,512, Cl. 374-6.000

Leung, Peter K., Steiger, Ronald P., and Kunze, Kenneth R., to Exxon Production Research Company, Method for determining the swelling clay content of cement mixtures by dielectric measurements, 5,010,301, Cl. 324-376.000

Lever Brothers Company, Division of Conopco Inc. *See*—
Foster, Francis G., 5,009,800, Cl. 252-8.900

Levi, Mark W., to United States of America, America, Wafer cleaning method, 5,009,240, Cl. 134-7.000

Levine, Harry, Slade, Louise, Van Lengerich, Bernhard, and Pickup, John G., to Nabisco Brands, Inc., Glassy matrices containing volatile and/or labile components, and processes for preparation and use thereof, 5,009,900, Cl. 426-96.000

Levinson, Arthur, Simonsen, Christian, and Yelverton, Elizabeth M., to Genentech, Inc., Human t-PA production using vectors coding DHFR protein, 5,010,002, Cl. 435-69.200

Levison, Barrie, Towel or cloth container, 5,009,327, Cl. 220-890.000

Levy, Davida, Magnetic jewelry closure with clip, 5,008,984, Cl. 24-303.000

Lewis, Larry N., to General Electric Company, Flame retardant aromatic polycarbonate compositions, 5,010,148, Cl. 525-464.000

Leybold Aktiengesellschaft *See*—
Gruenwald, Heinrich, Ramisch, Hans, and Pawlakowitsch, Anton, 5,009,738, Cl. 156-345.000

Liang, Jeanine *See*—
Lee, Hsien-Che, Lee, Hui-Jung, Kwon, Heemin, and Liang, Jeanine, 5,010,504, Cl. 364-574.000

Liang, Rong-Chang, Colyer, Emerson K., Chen, Jing-Den, Lee, Karl A., and Suen, Chih Her, to Mead Corporation, The, Microsuspension polymerization, 5,010,114, Cl. 521-109.100

Liaw, Peter, Structure of a multipurpose, hand-held swivel type stationery case, 5,009,336, Cl. 211-69.100

Libbey-Owens-Ford Co. *See*—
Weaver, William R., 5,009,821, Cl. 264-22.000

Liberty Diversified Industries, Inc. *See*—
Esau, LaVerne, 5,009,565, Cl. 414-607.000

Liesen, Gregory P. *See*—
Lam, William Y., and Liesen, Gregory P., 5,009,802, Cl. 252/48.200

Liet, Frederieus, to Liets Agrarische Technieken B.V., Heating device, 5,009,219, Cl. 126-523.000

Liets Agrarische Technieken B.V. *See*—
Liet, Frederieus, 5,009,219, Cl. 126-523.000

Light Ideas Incorporated *See*—
Streck, Donald A., and Iggulden, Jerry R., 5,009,368, Cl. 239-70.000

Lilliwyte Societe Anonyme *See*—
Baker, Derrick J., Bugden, Walter G., and Smith, Peter R., 5,009,357, Cl. 228-122.000

Lin, Emily M. Y. Double hook-bolt unit lock, 5,009,089, Cl. 70-114.000

Lin, Israel J., and Yotvat, Jacob, Magnetic treatment of water used for agricultural purposes, 5,009,791, Cl. 210/695.000

Lin, Jiang-Jen *See*—
Speranza, George P., Lin, Jiang-Jen, and Cuscurida, Michael, 5,010,160, Cl. 528-45.000

Lin, John Y. Waterscape lamp with shade of proximity-capacitance sensing type device, 5,010,460, Cl. 362-101.000

Lin, Sung-Wei *See*—
Gill, Manzur, and Lin, Sung-Wei, 5,010,028, Cl. 437-43.000

Lin, True-Lon, Fathauer, Robert W., and Grunthaner, Paula J., to California Institute of Technology, Pinhole-free growth of epitaxial CoSi2 film on Si(111), 5,010,037, Cl. 437-200.000

Lincoln, Thomas C., to Mierodot Inc., Method and apparatus for fabricating a pigtailed lens assembly, 5,009,482, Cl. 350-96.180

Lindel, Hans, Hallenbach, Werner, Berschauer, Friedrich, Greife, Heinrich, and Klotz, Gernot, to Bayer Aktiengesellschaft, 2,4-dihalogeno-6-pyridylethanolphenylisopropylamines for shifting the protein-fat ratio of animals in favor of protein, 5,010,091, Cl. 514-357.000

Linder, Ernst *See*—
Grob, Ferdinand, Kienzler, Dieter, Linder, Ernst, Potschin, Roger, and Stutzenberger, Heinz, 5,009,064, Cl. 60-276.000

Lindner, Christian *See*—
Westeppe, Uwe, Piejko, Karl-Erwin, and Lindner, Christian, 5,010,138, Cl. 525-183.000

Lindsay, William B., to General Signal Corporation, Ball screw supported Z stage, 5,010,295, Cl. 324-158.00R

Lindstrom, Michael J., to Atochem North America, Inc., Method for determining sulfur loading in organic polysulfides, 5,010,022, Cl. 436-123.000

Linke, Udo *See*—
Boden, Karl, Ihach, Harald, and Linke, Udo, 5,009,865, Cl. 422-249.000

Linsmeyer, Greg *See*—
Linsmeyer, John C., and Linsmeyer, Greg, 5,009,378, Cl. 248-99.000

Linsmeyer, John C., and Linsmeyer, Greg, Rake mate and methods of constructing and utilizing same, 5,009,378, Cl. 248-99.000

Linssen, Johannes L. J. M. and Pleyers, Jozef J. A., to Oce-Nederland B.V., Apparatus for supplying and discharging originals in a copying machine, 5,010,373, Cl. 355-319.000

Linville, Andrew F., Jr., and Shirley, Thomas E., to Mobil Oil Corporation, Method of digital filtering, 5,010,526, Cl. 367-46.000

Lipkin, Charles L., and Jones, Marianne, to Andrew Corporation, Anti-icing and de-icing system for reflector-type microwave antennas, 5,010,350, Cl. 343-704.000

Lipman, Kenneth, and Young, Douglas G., to International Fuel Cells, Current balancing structure for semiconductor switching devices, 5,010,470, Cl. 363-132.000

Lipo, Thomas A., and Xu, Longya, to Wisconsin Alumni Research Foundation, Variable speed machine with high power density, 5,010,267, Cl. 310-162.000

Liposome Company, Inc., The *See*—
Popescu, Mircea C., and Mertz, Edgar T., 5,009,819, Cl. 264-4.100

Lippman, Andrew B. *See*—
Schreiber, William F., Lippman, Andrew B., Adelson, Edward H., and Netravali, Aran N., 5,010,405, Cl. 358-141.000

Lipukhin, Jury V., Danilov, Leonid I., Ivoditov, Albert N., Garber, Eduard A., Subbotin, Anatoly N., Pavlov, Valentin P., Zhukov, Jury K., and Pimenov, Alexandr F., Apparatus for descaling the surface of a strip, 5,009,037, Cl. 51-7.000

Littleton, L. Arthur *See*—
Freidel, Kenneth; Littleton, L. Arthur, and Freund, William G., 5,009,693, Cl. 65-107.000

Litz, Lawrence M. *See*—
Weise, Mark K., Kingsley, Jeffery P., and Litz, Lawrence M., 5,009,816, Cl. 261-21.000

Liu, Yow-Juang (Bill), and Hadjizadeh-Amini, Zahra, to Advanced Micro Devices, Inc., Method of detecting the width of spacers and lightly doped drain regions, 5,010,029, Cl. 437-44.000

Ljungstrom, Tommy *See*—
Hanerus, Goran, and Ljungstrom, Tommy, 5,009,339, Cl. 222-1.000

Lloyd, Kenneth *See*—
Albino, Anthony, Lloyd, Kenneth, Ikeda, Hisami, and Old, Lloyd, 5,009,995, Cl. 435-7.230

Lo Baido, Giuseppe *See*—
Antonaroli, Simonetta, Bianco, Armandodariano, Brufani, Mario, Lo Baido, Giuseppe, and Rende, Giorgio, 5,010,204, Cl. 548-128.000

Lobitz, Walter A. *See*—
Chang, Ker-Chin, Elkins, Clarence E., Marshall, Paul A., Dunwoodie, Duane F., Mansour, Mohamed M., Bauer, Paul R., and Lobitz, Walter A., 5,010,544, Cl. 370-13.100

Loeffelholz, Frido *See*—
Worschech, Kurt, Wedl, Peter, Fleischer, Erwin, Loeffelholz, Frido, and Jaeckel, Manfred, 5,010,123, Cl. 524-114.000

Loewe, Erhard, to Du Pont de Nemours, E. I., and Company, Roll cassette with spacers for height adjustment, 5,009,372, Cl. 242-71.100.

Lof, Stig U., to Unroc Aktiebolag, Laterally adjustable drilling tool, 5,009,274, Cl. 175-260.000

Loge, Olaf *See*—
Skuballa, Werner; Dahl, Helmut, Vorbrueggen, Helmut, Loge, Olaf, and Thierauch, Karl-Heinz, 5,010,065, Cl. 514-58.000.

Lombardino, Paul A., Saxon, Ronald L., and Supchak, Dennis W., to Pharmacia Diagnostics Inc., Reagent tablet dispenser, 5,009,561, Cl. 414-412.000.

Lonardi, Emile, to Paul Wirth S.A., Device for reducing the stresses on a sealing shutter, 5,009,398, Cl. 266-199.000.

Loncraine Broxton & Partners Limited *See*—
Broxton, Peter A., 5,009,341, Cl. 222-130.000

Long, Royal B., Lock device with retaining cable, 5,009,087, Cl. 70-49.000

Longley, Ross E. *See*—
Gunasekera, Mahka, Gunasekera, Sarath P., Longley, Ross E., and Burres, Neal S., 5,010,099, Cl. 514-459.000

Longuet-Higgins, Michael S., Building blocks, 5,009,625, Cl. 446-92.000

Lonza LTD *See*—
Kunz, Reiner, and Dietrich, Rainer, 5,009,675, Cl. 51-295.000

Loos, Horst *See*—
Schneider, Alfred, Loos, Horst, and Fischbach, Karl H., 5,009,034, Cl. 49-192.000

Lord, Peter R., to North Carolina State University, Method and apparatus for detecting mechanical roll imperfections in a roler drafting system, 5,010,494, Cl. 364-507.000

Lord, Randall D. *See*—
Eilert, Randall N., Neel, Robert M., Harvey, N. Thatcher, Ames, Wilbur R., IV, and Lord, Randall D., 5,008,974, Cl. 16-114.00R

L'Oreal *See*—
Grollier, Jean-Francois, Fiquet, Claire, Fourcadier, Chantal, Dubief, Claude, and Cauwet, Daniele, 5,009,880, Cl. 424-047.000
Gueret, Jean-Louis, 5,009,534, Cl. 401-75.000
Morane, Bruno, 5,009,340, Cl. 222-94.000

Lorenzana, Moises B. and Lorenzana, Vance A., Apparatus for supplying water continuously to tree stand, 5,009,028, Cl. 47-40.500

Lorenzana, Vance A. *See*—
Lorenzana, Moises B. and Lorenzana, Vance A., 5,009,028, Cl. 47-40.500

Lovell, Keith V. *See*—
Kronfli, Esam, Lovell, Keith V., Hooper, Alan, and Neat, Robin J., 5,009,970, Cl. 429-192.000

Low, John A. *See*—
Chance, Lynn C. and Low, John A., 5,009,307, Cl. 198-538.000

Lov, Jerald M. *See*—
Dunaway, Thomas J., Spielberger, Richard K., Dicks, Lori A., and Lov, Jerald M., 5,010,387, Cl. 357-70.000

LPF Verpakkingen B.V. *See*—
Huizinga, Gert J., 5,010,231, Cl. 219-121.690

Luallin, John M., Nagengast, William E., and Roeske, Robert G., to General Motors Corporation, Headlamp assembly, 5,010,455, Cl. 362-61.000

Lucas Industries, plc *See*—
Shirley, Roy D., Nelson, Michael T., and Laurenzi, Robert J., 5,010,224, Cl. 219-69.170

Lucas, Robert M. *See*—
Hoffman, Charles T., Jr., Gordon, Ralph A., Hosmer, Thomas P., and Lucas, Robert M., 5,009,292, Cl. 188-71.700

Luddy, Michael A. G. *See*—
Chow, Allan T., and Luddy, Michael A. G., 5,009,998, Cl. 435-7.920

Ludwig, James F. Arrow rest and holder apparatus, 5,009,215, Cl. 124-44.500

Lueschen, Jeffrey D. Surfing saucer, 5,009,623, Cl. 441-56.000

Lui, Chung Y., to Merck & Co., Inc., Sustained release with high and low viscosity HPMC, 5,009,895, Cl. 424-465.000

Luksas, Anthony J. *See*—
Ahmed, Salah H., and Luksas, Anthony J., 5,009,913, Cl. 426-581.000

Lurie, Mark, Production of extruded round rod, 5,009,825, Cl. 264-148.000

Lutz, David E., and Lutz, David W., Cargo carrying vehicle having a movable bulkhead located therein, 5,009,564, Cl. 414-510.000

Lutz, David W. *See*—
Lutz, David E., and Lutz, David W., 5,009,564, Cl. 414-510.000

Lutzke, Wayne, to Nigrelli Systems, Inc., Automatic case accumulator, 5,009,303, Cl. 198-347.300

Luycka, Marcel G. M. *See*—
Stokbroekx, Raymond A., Luycka, Marcel G. M., and Janssens, Frans E., 5,010,198, Cl. 546-114.000

Luzio, Gary A. *See*—
Cohen, Richmond R., and Luzio, Gary A., 5,009,239, Cl. 131-342.000

Lyle, Robert L., Jr., to North American Philips Corporation, Voltage regulator with reduced semiconductor power dissipation, 5,010,292, Cl. 323-274.000.

Lynch, William R. *See*—
Wiant, Matthew J., Lynch, William R., and LeFreniere, Robert C., 5,009,917, Cl. 426-631.000.

Lynn, Gordon E. *See*—
Gatchel, Gary, Newgarden, Joseph E., and Lynn, Gordon E., 5,009,421, Cl. 273-30.000

Lyon, Richard S. *See*—
Sarko, Leonard S., and Lyon, Richard S., 5,009,511, Cl. 366-348.000.

Lysenkov, Viktor I. *See*—

Maeda, Minoru *See*—
Nakagawa, Hiroshi, and Maeda, Minoru, 5,010,262, Cl. 310-12.000

Maeda, Mitsuo *See*—
Ueyama, Satoshi, Kawakubo, Hiroaki, Isoda, Satoru, and Maeda, Mitsuo, 5,010,451, Cl. 361-504.000

Maeda, Shigemi *See—*
Fuji, Hiroshi, Fujiwara, Tsuneo, Iwaki, Takashi, Numata, Tomiyuki, Tsuji, Kentaroh, Maeda, Shigemi, Yamaguchi, Takeshi, Kojima, Kunio, Deguchi, Toshihisa, and Terashima, Shigeo, 5,010,540, Cl. 369-50.000

Maekawa, Yoshikazu, and Hirata, Tetsuo, to Konica Corporation Copier with automatic document feed having jam prevention function 5,010,364, Cl. 355-207.000

Maeno, Matagoro *See—*
Ohmi, Tadahiro, Miki, Masahiro, Kikuyama, Hirohisa, and Maeno, Matagoro, 5,009,963, Cl. 428-472.200

Maeno, Satoru *See—*
Kasahara, Nobuo, Watanuki, Masayoshi, Maeno, Satoru, and Ohkuni, Masato, 5,010,372, Cl. 355-313.000

Maeno, Yoshinori, Kobayashi, Masanobu, and Oishi, Kayoko, to Oki Electric Industry Co., Ltd. Magneto-optical recording medium having protective film with increased kerr effect and improved protection characteristic and manufacturing method of the same 5,009,762, Cl. 204-192.160

Maenpaa, Matti, Lehtoluoma, Teuvo, Henttinen, Kauko, Jokipalo, Pertti, Saren, Aimo, and Pirinen, Seppo, to Rautaruukki Oy Method and apparatus for the replacing of working rolls in a rolling mill 5,009,096, Cl. 72.239.000

Mag-Tek, Inc *See—*
Sheldon, Dunstan P., 5,010,240, Cl. 235-382.000

Magley, Donald A *See—*
Bustamante, Michael R., Renaker, John J., Jr., and Magley, Donald A., 5,009,790, Cl. 210-689.000

Maher, Galeb H., to MRA Laboratories, Inc. Capacitor with fine grained $BaTiO_3$ body and method for making 5,010,443, Cl. 361-321.000

Maholick, Andrew W *See—*
Kippenhan, B. William, and Maholick, Andrew W., 5,010,514, Cl. 364-900.000

Mahrer, Kenneth D., to Gas Research Institute Method for determining the depth of a hydraulic fracture zone in the earth 5,010,527, Cl. 367-86.000

Maier, Ludwig *See—*
Wenski, Guido, Maier, Ludwig, and Kreuzer, Franz-Heinrich, 5,009,934, Cl. 427-387.000

Maier, Ulrich *See—*
Seidel, Willi, Ehniss, Roland, Skabrond, Klaus, Sauter, Ulrich, Maier, Ulrich, and Ebner, Roland, 5,009,128, Cl. 74-866.000

Maitani, Yoshihisa, to Olympus Optical Company Ltd. Method and apparatus for photometry from plural points of automatic exposure camera 5,010,359, Cl. 354-410.000

Makita, Kensuke *See—*
Matsuda, Naohiko, and Makita, Kensuke, 5,009,933, Cl. 427-287.000

Makkuni, Ranjit, Zdybel, Frank, Jr., and Stults, Robert A., to Xerox Corporation Gesture-modified diagram for retrieval of image resembling diagram, with parts selectable for further interactive retrieval 5,010,500, Cl. 364-521.000

Malherbe, Bent, to Sony Corporation Method of making surface finishing rollers as well as a roller made thereby 5,008,993, Cl. 29-125.000

Malvern, Alan R., to British Aerospace Public Limited Company Optical sensor for determining changes in a dimension and/or a temperature of an object 5,009,505, Cl. 356-352.000

MAN Nutzfahrzeuge Aktiengesellschaft *See—*
Deschler, Gerhard, 5,009,001, Cl. 29-888.080

MAN Roland Druckmaschinen AG *See—*
John, Thomas, and Bock, Georg, 5,009,158, Cl. 101-219.000

Manabe, Hajime, and Murata, Yoshiyuki, to Casio Computer Co., Ltd. Electronic percussion instrument having a memory function and a musical tone parameter control function 5,009,146, Cl. 84-615.000

Manabe, Haruhiko *See—*
Suzuki, Fumio, Kuroda, Takeshi, Nakasato, Yoshisuke, Ohmori, Kenji, and Manabe, Haruhiko, 5,010,084, Cl. 514-293.000

Mandai, Harufumi, Tanaka, Yukio, Takakura, Shinichi, and Nakagawa, Takuji, to Murata Manufacturing Co., Ltd. Method of manufacturing laminated ceramic electronic component 5,009,744, Cl. 156-656.000

Manderfeld, Donald J., and Sells, Robert A., to DataCard Corporation Input hopper apparatus 5,009,411, Cl. 271-129.000

Manfredi, Antonina *See—*
Manfredi, Carl, Manfredi, Antonina, Manfredi, Dario P., and Giarraffa, Savia, 5,009,374, Cl. 244-1.00R

Manfredi, Carl, Manfredi, Antonina, Manfredi, Dario P., and Giarraffa, Savia Aircraft with releasable wings 5,009,374, Cl. 244-1.00R

Manfredi, Dario P *See—*
Manfredi, Carl, Manfredi, Antonina, Manfredi, Dario P., and Giarraffa, Savia, 5,009,374, Cl. 244-1.00R

Manganaro, James L *See—*
Wolf, Steven D., Manganaro, James L., and Miller, Ronald H., 5,009,677, Cl. 55-12.000

Mangeruga, Joseph N Debris collection for a lawnmower 5,009,377, Cl. 248-99.000

Maninger, Loren L., and Marks, Bruce G., to RCA Licensing Corporation Color picture tube having an electron gun with reduced convergence drift 5,010,271, Cl. 313-412.000

Mannesmann Aktiengesellschaft *See—*
Gugel, Bernd, Kaufmann, Clemens, Kitzberger, Herbert, and Rohrer, Kurt, 5,009,529, Cl. 400-124.000

Manoliu, Juliana, to National Semiconductor Corporation CMOS and bipolar fabrication process using selective epitaxial growth scalable to below 0.5 micron 5,010,034, Cl. 437-89.000

Manoury, Philippe, Binet, Jean, Obitz, Daniel, Defosse, Gerard, Dewitte, Elisabeth, and Veronique, Corinne, to Synthelabo Indolone derivatives, their preparation and their application in therapy 5,010,079, Cl. 514-253.000

Manschitz, Erwin, to Hilti Aktiengesellschaft Tool chuck for tool bits 5,009,440, Cl. 279-71.000

Mansour, Mohamed M *See—*
Chang, Ker-Chin, Elkins, Clarence F., Marshall, Paul A., Dunwoodie, Duane E., Mansour, Mohamed M., Bauer, Paul R., and Lobitz, Walter A., 5,010,544, Cl. 370-13.100

Manssen, Keith R., and Moutrie, Michael F., to Motorola, Inc. Ceramic block filter with co-fired coupling pins 5,010,309, Cl. 333-206.000

Mansukhani, Gul *See—*
Cherukuri, Subraman R., Raman, Krishna, Mansukhani, Gul, Cirese, Ralph, and Wong, Lucy I., 5,009,893, Cl. 424-440.000

Manufacture d'Appareillage Electrique de Cahors *See—*
Therond, Michel, 5,009,734, Cl. 156-184.000

Manufacturer's Consultants, Inc *See—*
Smith, Franklin G., 5,009,256, Cl. 152-221.000

Manville Corporation *See—*
Smith, Timothy R., 5,009,906, Cl. 426-330.400

Marc, Pierre A *See—*
Brady, Thomas F., Condon, Michael F., and Marc, Pierre A., 5,009,699, Cl. 71-92.000

Marciano-Agostinelli, Fabrizio, Barbaro-Forleo, Marco, Marin, Carlo and Cinquemani, Paul L., to Pirelli Cable Corp. Power cable with water swellable agents and elongated metal elements outside cable insulation 5,010,209, Cl. 174-23.00C

Marconi Instruments, Inc *See—*
Janney, Mark A., Newey, Roger, and Robinson, Irwin J., III, 5,010,560, Cl. 377-20.000

Maresch, Gerald *See—*
Hula, Emil, and Maresch, Gerald, 5,009,750, Cl. 204-13.000

Maresch, Peter *See—*
Glomb, Reiner, Maresch, Peter, and Wagner, Ralf, 5,009,136, Cl. 82-127.000

Marhold, Albrecht *See—*
Schade, Gerold, Marhold, Albrecht, and Brandes, Wilhelm, 5,010,094, Cl. 514-399.000

Maric, Milan, and Kulas, John I Drill assembly 5,009,271, Cl. 175-53.000

Marin, Carlo *See—*
Marciano-Agostinelli, Fabrizio, Barbaro-Forleo, Marco, Marin, Carlo, and Cinquemani, Paul L., 5,010,209, Cl. 174-23.00C

Marin Tek, Inc *See—*
Missimer, Dale J., Fyfe, David T., Jr., Housman, Joseph J., and Forrest, Scott M., 5,009,073, Cl. 62-51.100

Marine Environmental Research, Inc *See—*
Riffe, William J., and Carter, Jack D., Jr., 5,009,757, Cl. 204-147.000

Marion Laboratories, Inc *See—*
Bottom, Carey B., and Kwoka, Margaret N., 5,010,069, Cl. 514-166.000

Markel Industries, Inc *See—*

Araya, Junji, Ohzeki, Yukihiro, Miyamoto, Toshio, Hiroshima, Koichi, Sato, Yasushi, and Nakahata, Kimio, 5,010,370, Cl. 355-274.000

Miyata, Hidenobu, to GFK GmbH, Video printer, 5,010,408, Cl. 364-519.000

Mizumura, Yutaka *See*—
Yatsuka, Takeshi, Murata, Hiroshi, Mizumura, Yutaka and Kotera, Nobukazu, 5,009,960, Cl. 428-423.100

Mizuno, Tsuyoshi and Hirano, Motoki, to Nissan Motor Company, Ltd., Plane patch antenna, 5,010,349, Cl. 343-700.0MS

MNY Holdings and Agencies Limited *See*—
Grinberg, Oded, 5,009,164, Cl. 102-502.000

Moberg, Gregory O., to Eastman Kodak Company, Method and apparatus for driving a DC motor, 5,010,282, Cl. 318-254.000

Mobil Oil Corporation *See*—
Avidan, Amos A. and Yurchak, Sergei, 5,009,851, Cl. 422-141.000
Bartilucci, Mark P., Karsner, Grant G. and Tracy, William J. III, 5,009,767, Cl. 208-65.000
Harandi, Mohsen N. and Owen, Hartley, 5,009,850, Cl. 422-189.000
Kovacs, Richard C., Krambeck, Frederick J. and Sarli, Michael S., 5,009,853, Cl. 422-144.000
Linville, Andrew F. Jr. and Shirley, Thomas F., 5,011,526, Cl. 367-46.000

Mobil Solar Energy Corporation *See*—
Vayman, Zinovy S., 5,010,380, Cl. 437-230.000

Mobley, Dewey F., Peterson, Robert G. Sr. and LaCava, James E., to Interlock Corporation, Terminal assembly with fixed and flexible tab receptacle retainers, 5,009,615, Cl. 439-595.000

Modern Industries, Inc. *See*—
Barnes, Richard C. and Hayes, Philip A., 5,009,967, Cl. 14-7.000

Moeller, Randolph C. *See*—
Sliger, Kris M., Moeller, Randolph C. and Williamson, Scott E., 5,009,264, Cl. 166-106.000

Mohanty, Dilip K. *See*—
Hamdi, Amir F., Marten, F. Lennart and Mohanty, Dilip K., 5,010,158, Cl. 526-243.000

Mohnot, Shantilal M. *See*—
Johnson, Hiram B., Laferty, Samuel B., Wright, Merwin P. and Mohnot, Shantilal M., 5,009,671, Cl. 427-252.000

Moring, Ove and Resa, Steinar, to Akva A/S, Method of pelleting dry pellets from a mixture containing thermo-hardened ingredients particularly for use as fish feed, and the machine for carrying out the process, 5,009,808, Cl. 426-454.000

Mold Masters Limited *See*—
Schmidt, Harald H., 5,009,718, Cl. 156-242.000

Moles, Incorporated *See*—
Plocek, Edward J., Weiss, Stephen Z. and Pike, Benjamin, 5,009,604, Cl. 433-154.000
Regner, Kent, 5,009,641, Cl. 433-26.000
Rishworth, Paul E., Rishworth, Dennis E. and Dixon, Daniel A., 5,009,612, Cl. 433-40.000

Molins, Alberto F., Method of recovering energy from sea waves, 5,009,069, Cl. 60-641.200

Moll, Franz *See*—
Scheerer, Rainer and Moll, Franz, 5,009,900, Cl. 430-300.000

Mollier, Pierre *See*—
Bouden, Gerard, Mollier, Pierre, Suez, Jean-Paul, Ong, Teng Tannhot, Pascal and Wallart, Francis, 5,011,257, Cl. 385-146.000

Monarch Marking Systems, Inc. *See*—
Goodwin, Brent E., Karn, Donald L. and Mistarz, John D., 5,009,789, Cl. 156-384.000

Monroe, James A. *See*—
Newman, Jack and Monroe, James A., 5,010,267, Cl. 307-116.000

Monsanto Company *See*—
Ebner, Jerry R. and Gleaves, John T., 5,009,842, Cl. 422-63.000
Hardiman, Christopher T., 5,011,154, Cl. 527-145.000
Iwaszkowicz, Carlos, 5,009,369, Cl. 260-22.000

Montangero, Paolo *See*—
Braglia, Marco, DeFrancesco, Robert, and Montangero, Paolo, 5,010,254, Cl. 250-396.000

Montgomery, Gary V. and Beck, Terry E., to Sunbeam Plastics Corporation, Tamper indicating closure having a rotary seal, 5,009,329, Cl. 215-252.000

Moody, Paul E., to United States of America, Navy, Submarine torpedo tube shutterway launch mode adapter, 5,009,152, Cl. 114-238.000

Mooney, Gerry *See*—
Kosin, John A., Mooney, Gerry, Tarquini, Michael V. and Garcia, Rod A., 5,009,820, Cl. 252-350.000
Wason, Satish K., Mooney, Gerry, Andrews, Claude R., Tarquini, Michael E., Kosin, John A. and Garcia, Rod A., 5,009,810, Cl. 252-350.000

Moore, John F. to Kabushiki Kaisha Toshiba, System for communicating energy between territory missing devices, 5,010,294, Cl. 250-551.000

Moore, Richard C. *See*—
Dekeyser, Mark A. and Moore, Richard C., 5,010,005, Cl. 514-7.000

Moore, Wayne D. *See*—
Raikes, Terry F., Kramer, William L., Howard, John H., Moore, Wayne D., Jackson, Lewis and Kotecki, Jeffrey D., 5,009,277, Cl. 137-25.5

Morales, Alfredo *See*—
Galbasso, Roberto, Morales, Alfredo and Salazar, Jose A., 5,009,268, Cl. 205-367.000

Moran, Larry K. and Murray, Thomas R., to Conoco, Inc., Well cement fluid loss additive and method, 5,009,267, Cl. 166-293.000

Moran, Susan C. *See*—
Abu Isa, Ismat A., Lusebi, Elio, Jaynes, Craig B., Moran, Susan C. and Rey, Michael A., 5,009,827, Cl. 264-156.000

Morand, Michel, to Wyant & Company, Limited, Bathroom tissue dispenser (spindle release), 5,009,313, Cl. 206-391.000

Morane, Bruno, to L'Oreal, Packaging container using a system of fermentation to produce a propulsive gas, 5,009,340, Cl. 222-94.000

Moreau, Sylviane *See*—
Kim, Sun H. and Moreau, Sylviane, 5,010,089, Cl. 514-314.000

Morgan, Charles R., Reverse-diffusing baffle for applying sprout inhibitor to stored potatoes, 5,009,152, Cl. 99-476.000

Morgan, Cheryle L. and Judy, Millard M., Medical sponges and wipes with a barrier impermeable to infectious agents, 5,009,652, Cl. 604-365.100

Mori, Kinji, Kuma, Yuko, Akiyama, Masakazu, Kadowa, Tadaaki, Kawano, Katsumi, Miyamoto, Shoji, Nohmi, Makoto, Shingai, Sadamori, and Ihara, Hirokazu, to Hitachi, Ltd., Information processing and storage system with signal transmission loop line, 5,010,479, Cl. 364-200.000

Mori, Shuichi *See*—
Utsugi, Nobuo, Kihara, Hisashi, Mori, Shuichi, Fuse, Junichi, Miyake, Takashi and Ikata, Yoshikatsu, 5,010,437, Cl. 360-137.000

Morikawa, Kiyoshi *See*—
Kobayashi, Kazuo, Morikawa, Kiyoshi, Yamada, Yoshinori, Kurumada, Masakazu, and Sugihara, Masanori, 5,010,484, Cl. 369-77.200

Morikawa, Koji, to Fuji Jukogyo Kabushiki Kaisha, Two-cycle engine having a direct fuel injection system, 5,009,201, Cl. 123-65.0BA

Morikuni, Mitsuru *See*—
Matsumoto, Kenji, Yanagita, Tomoatsu, Nishiyama, Yoshinori, Nagai, Masahiko, and Morikuni, Mitsuru, 5,010,493, Cl. 364-490.000

Morimoto, Akira, to Asahi Kogaku Kogyo Kabushiki Kaisha, Light scanning device with polarizing device to make light transmission more uniform, 5,009,472, Cl. 350-6.500

Morimoto, Yoshihiko and Kohno, Tetsushi, to Fuji Jukogyo Kabushiki Kaisha, Transmission ratio control system for a continuously variable transmission, 5,009,127, Cl. 74-866.000

Morimoto, Yoshihiko, and Kohno, Tetsushi, to Fuji Jukogyo Kabushiki Kaisha, Transmission ratio control system for a continuously variable transmission, 5,009,129, Cl. 74-866.000

Morin, Carl F. *See*—
Benin, Joshua, Di Maio, William G., Morin, Carl F., and Lawler, James A., 5,009,942, Cl. 428-36.600

Morinaga, Akio, and Kigami, Takeo, to Mitsui Petrochemical Industries, Ltd., Water-base paint for coating the inside surface of metallic can, 5,010,132, Cl. 524-601.000

Morinaga, Tetsuya *See*—
Kaneko, Toshimi, Morinaga, Tetsuya, and Hatakenaka, Tetsuo, 5,010,313, Cl. 335-296.000

Morita, Kaoru, and Shioda, Atsushi, to Kansai Paint Co., Ltd., Can interior coating composition, 5,010,149, Cl. 525-481.000

Morita, Shigetoshi *See*—
Taguchi, Akira, Morita, Shigetoshi, Taka, Shunichi, Yamada, Hirohide, Takada, Yoshiaki, Furuichi, Shinji, and Ao, Masahiro, 5,010,429, Cl. 360-103.000

Morita, Tsutomu *See*—
Tsuyuguchi, Hiroshi, Noda, Yasushi, Morita, Tsutomu, and Shimozawa, Kenji, 5,010,246, Cl. 250-216.000

Morita, Yuzo *See*—
Yoneda, Kenzi, Ueshima, Takaaki, Kuzunuki, Soshiro, Morita, Yuzo, and Tobita, Toshimitsu, 5,010,472, Cl. 364-148.000

Moriwaki, Masafumi, Sano, Shigeaki, Hatakeyama, Katsunori, Yamada, Hiroshi, and Nouno, Youzou, to Toppan Moore Company, Ltd., Signal input sheet, 5,010,213, Cl. 178-18.000

Moriya, Naoko *See*—
Watanabe, Taichi, Ogino, Hidekazu, Hirota, Hajime, Koshika, Tomohito, Moriya, Naoko, and Nozaki, Toshio, 5,009,813, Cl. 252-545.000

Morningstar, Leroy J. *See*—
Fogg, Michael W., and Morningstar, Leroy J., 5,009,616, Cl. 439-608.000

Morris, Christopher J., Coulson, Ian, and Surguy, Paul W. H., to Thorn EMI plc, Display device, 5,010,328, Cl. 340-784.000

Morris, James K., Jacketed paint pellet, 5,009,165, Cl. 102-513.000

Morris, Robert C. *See*—
Damgaard-Iversen, Karsten, Morris, Robert C., Chin, Timothy C., and Kuper, Jerry W., 5,009,658, Cl. 606-128.000

Morrison, Daryl K. *See*—
Elias, Samir F., and Morrison, Daryl K., 5,010,129, Cl. 524-413.000

Morrison, Shawn J., to Northern Telecom Limited, Optical fiber coupling device and method for its use, 5,009,479, Cl. 350-96.150

Mortimore, David B., and Payne, David B., to British Telecommunications public limited company, Optical two-way transmission system with loop reflector modulator, 5,010,586, Cl. 455-605.000

Mosele, John L., and Stolpe, Lars O., to Jelp, Inc., Temporary traffic light control, 5,010,336, Cl. 340-907.000

Moss, Gaylord E. *See*—
Shih, I-Fu, Chang, David B., Arns, James A., Moss, Gaylord E., and Smith, Ronald T., 5,009,502, Cl. 356-152.000

Motoi, Toshihiro *See*—
Murahashi, Takashi, Nakazawa, Toshihiko, Takesue, Toshihiro, and Motoi, Toshihiro, 5,010,353, Cl. 346-108.000

Motorola, Inc. *See*—
Braun, Jeffrey J., 5,010,303, Cl. 330-257.000
Johnson, Richard F., Kabcenell, Amy R., and DeLuca, Joan S., 5,010,547, Cl. 370-94.100
Kobylarz, Daniel E., and Ford, David K., 5,010,570, Cl. 379-390.000
Kuhl, Virgil F., and Noll, Guenter, 5,008,988, Cl. 24-510.000
Manssen, Keith R., and Moutrie, Michael F., 5,010,309, Cl. 333-206.000
Parken, William D., 5,010,583, Cl. 455-9.000
Pfiester, James R., and Hayden, James D., 5,010,030, Cl. 437-192.000
Schwendeman, Robert J., and Kuznicki, William J., 5,010,317, Cl. 340-311.100
Snowden, Gregory O., Barrett, Clifford E., III, and Gomez, Fernando, 5,010,330, Cl. 340-825.210

Motoyama, Shimesu *See*—
Niwa, Kozo, and Motoyama, Shimesu, 5,009,891, Cl. 424-195.100

Mott, Philip J. *See*—
Ivey, John S., Bateman, Paul M., Clauss, Julius A., Cole, Edward H., Jr., and Mott, Philip J., 5,009,631, Cl. 474-213.000

Motykiewicz, Krystyn, to Rostra Engineered Components, Solenoid actuators, 5,010,312, Cl. 335-261.000

Moulin, Claude *See*—
Ferrua, Bernard, and Moulin, Claude, 5,010,017, Cl. 436-500.000

Mouri, Takayuki, to Ikeda Bussan Co., Ltd., Vehicle seat with seatbelt buckler receiver, 5,009,469, Cl. 297-468.000

Moutrie, Michael F. *See*—
Manssen, Keith R., and Moutrie, Michael F., 5,010,309, Cl. 333-206.000

Mowforth, Clive W., Bullock, James F., Maternaghan, Trevor J., and Harvey, Karen N., to Ilford Limited, Silver halide emulsions containing twinned silver halide crystals, 5,009,991, Cl. 430-567.000

MRA Laboratories, Inc. *See*—
Maher, Caleb H., 5,010,443, Cl. 361-321.000

Muellenberg, Ralph, Clamping set with screw sleeve, 5,009,539, Cl. 403-370.000

Mueller, Carl F. *See*—
Garg, Diwakar, Mueller, Carl F., Schaffer, Leslie E., and Dyer, Paul N., 5,009,966, Cl. 428-627.000

Mueller, Hans R., Ulmann, Martin, Conti, Josef, and Muerdel, Guenter, to Eprova AG, Method for the resolution of folinic acid, 5,010,194, Cl. 544-258.000

Mueller, Karl F., to Ciba-Geigy Corporation, Reactive silicone and/or fluorine containing hydrophilic prepolymers and polymers thereof, 5,010,141, Cl. 525-276.000

Mueller, Karl F., to Ciba-Geigy Corporation, Vinyl-urethane substituted hydroxyethyl cellulose, 5,010,155, Cl. 527-301.000

Mueller, Otward M., and Edelstein, William A., to General Electric Company, Cryogenically-cooled radio-frequency power amplifier, 5,010,304, Cl. 330-269.000

Mueller, Richard A. *See*—
Fuller, George C., Martin, George R., Mueller, Richard A., and Reich, Reuven, 5,010,080, Cl. 514-255.000

Mueller, Timothy T. Sculpture apparatus, 5,009,599, Cl. 434-81.000

Muerdel, Guenter *See*—
Mueller, Hans R., Ulmann, Martin, Conti, Josef, and Muerdel, Guenter, 5,010,194, Cl. 544-258.000

Muirfield Holdings L.P. *See*—
Freidel, Kenneth, Littleton, I. Arthur, and Freund, William G., 5,009,693, Cl. 65-107.000

Mukai, Tadayoshi and Yoshino, Akira, to Matsushita Electric Works, Ltd., Induction motor control system, 5,010,287, Cl. 318-801.000

Mukai, Toshio *See*—
Sakamoto, Hiroaki, Fujikura, Masahiro, and Mukai, Toshio, 5,009,706, Cl. 75-244.000

Mukoyama, Yoshiyuki *See*—
Tanaka, Kazuyuki, Iwami, Etsuji, Matsuzawa, Jun, Mukoyama, Yoshiyuki, Shibata, Noriohiko, Hanawa, Akinori, and Yokota, Mitsuo, 5,009,949, Cl. 428-260.000

Muller, Eugenio *See*—
Boghen, Franklin M., Camanni, Franco, Del Soldato, Piero, Ghigo, Ezio, and Muller, Eugenio, 5,010,056, Cl. 514-12.000

Muller, German, to Industrie Automation Sondertechnik GmbH & Co., Process for the separation of heavy metals from waste materials, 5,009,793, Cl. 210-710.000

Muller, Hans-Werner *See*—
Traubel, Harro, Strenger, Heinrich, Weber, Karl A., Muller, Hans-Werner, Zapfel, Horst, and Hummel, Axel, 5,009,921, Cl. 427-31.000

Muller, Heinz *See*—
Gloeckler, Gerhard, Muller, Heinz, Kepplinger, Leopold W., Matzawrakos, Panajiotis, Koch, Erwin, and Auberger, Heinrich, 5,009,397, Cl. 266-197.000

Mullverbrennungsanlage Wuppertal GmbH *See*—
Temelli, Sedat, 5,009,173, Cl. 110-244.000

Multiform Desiccants, Inc. *See*—
Cullen, John S., Incorvia, Samuel A., Sigon, Christopher S. and Vaylen, Nicholas E., 5,009,308, Cl. 206-204.000

Multisource Technology Corp. *See*—
Estrov, Alexander, 5,010,314, Cl. 336-198.000

Munie, Gregory C. *See*—
Dodd, Courtney V., and Munie, Gregory C., 5,009,724, Cl. 148-23.000

Murahashi, Takashi, Nakazawa, Toshihiko, Takesue, Toshihiro, and Motoi, Toshihiro, to Konica Corporation, Laser recorder with integrally molded deflector, 5,010,353, Cl. 346-108.000

Murai, Keiichi *See*—
Honda, Mitsuru, Koike, Atsushi, Kimura, Tomohiro, Ogawa, Kyosuke, and Murai, Keiichi, 5,009,974, Cl. 430-69.000

Murai, Takeshi *See*—
Naito, Yasuo, Kouzuki, Hiroyuki, and Murai, Takeshi, 5,010,490, Cl. 364-426.040

Murakami, Masakazu *See*—
Uehara, Katsuhiro, Kurita, Masanori, and Murakami, Masakazu, 5,009,584, Cl. 425-135.000

Murakami, Tokumichi, Asai, Kohtaro, Kamizawa, Koh, Nishida, Masami, Yamazaki, Eizo, Itoh, Atsushi, and Kinjoh, Naoto, to Mitsubishi Denki Kabushiki Kaisha, Picture coding and decoding apparatus using vector quantization, 5,010,401, Cl. 358-136.000

Murao, Fumihide, to Mitsubishi Denki Kabushiki Kaisha, Automatic white balance circuit capable of effectively adjusting white balance under a flashing light source, 5,010,394, Cl. 358-29.000

Muraoka, Takao *See*—
Yamada, Takehito, Tanimoto, Kazushi, Sakai, Yuji, Muraoka, Takao, Inoue, Tetsuo, and Takada, Yoshinao, 5,010,430, Cl. 360-103.000

Murata, Hiroshi *See*—
Yatsuka, Takeshi, Murata, Hiroshi, Mizumura, Yutaka and Kotera Nobukazu, 5,009,960, Cl 428-423.100

Murata, Katsuhide *See*—
Hirano, Yoshinao, Sato, Katsumo, Nagamori, Shigeru, Murata, Katsuhide, Horikiri, Kazuhito, and Shirai, Junji, 5,009,585, Cl 425-174.400

Murata, Kouji *See*—
Honkura, Yoshinobu, Matsuo, Toru, and Murata, Kouji, 5,009,723, Cl 148-12.00E

Murata Manufacturing Co., Ltd *See*—
Kaneko, Toshimi, Morinaga, Tetsuya, and Hatakenaka, Tetsuo, 5,010,313, Cl 335-296.000
Mandai, Harufumi, Tanaka, Yukio, Takakura, Shinichi and Nakagawa, Takuji, 5,009,744, Cl 156-656.000

Murata, Shigemi, to Mitsubishi Denki Kabushiki Kaisha Hall effect type sensing device 5,010,263, Cl 310-68.00B

Murata, Yoshiyuki *See*—
Manabe, Hajime, and Murata, Yoshiyuki, 5,009,146, Cl 84-615.000

Murdoch, James B *See*—
Paley, Martyn N J, Murdoch, James B, Lampman, David A, and McNally, James M., 5,010,300, Cl 324-309.000

Murphy, Martin J., Jr., Stubbs, Jack B, and Leonard, Thomas A., to Hipple Cancer Research Corporation Automated capillary scanning system 5,009,503, Cl 356-339.000

Murray, Thomas R *See*—
Moran, Larry K, and Murray, Thomas R., 5,009,269, Cl 166-293.000

Murray, William D *See*—
Duff, Sheldon J B, and Murray, William D., 5,010,005, Cl 435-147.000

Muskegon Automation Equipment, Inc *See*—
Johnson, Bruce R., 5,008,995, Cl 29-252.000

Musyck, Christian E *See*—
Musyck, Emile P, and Musyck, Christian E., 5,010,573, Cl 380-28.000

Musyck, Emile P, and Musyck, Christian E, Cryptographic system by blocs of binery data 5,010,573, Cl 380-28.000

Nabisco Brands, Inc *See*—
Levine, Harry, Slade, Louise, Van Lengerich, Bernhard and Pickup, John G., 5,009,900, Cl 426-96.000

Nagai, Masahiko *See*—
Matsumoto, Kenji, Yanagita, Tomoatsu, Nishiyama, Yoshinori, Nagai, Masahiko and Morikuni, Mitsuru, 5,010,493, Cl 364-490.000

Nagakura, Kaoru, to Fujitsu Limited Block polling data communication system having optimum block determination means 5,010,329, Cl 340-825.080

Nagamori, Shigeru *See*—
Hirano, Yoshinao, Sato, Katsumo, Nagamori, Shigeru, Murata, Katsuhide, Horikiri, Kazuhito, and Shirai, Junji, 5,009,585, Cl 425-174.400

Nagano, Masashi, to Shimano Industrial Company Limited Brake control apparatus for bicycle 5,009,119, Cl 74-489.000

Naganuma, Hiroshi, Sato, Kenji, Yamamoto, Masashi, Kubota, Toshiaki, Hayashi, Hiroshige, and Ishizaka, Yoshirou, to Sanyo Electric Co., Ltd Low-temperature show case 5,009,080, Cl 62-256.000

Nagao, Masashi, to Mitsubishi Denki Kabushiki Kaisha Refrigerator 5,009,072, Cl 62-6.000

Nagashima, Shigeo *See*—
Omoda, Koichiro, Tanaka, Teruo, Nakagoshi, Junji, Hamanaka, Naoki, and Nagashima, Shigeo, 5,010,477, Cl 364-200.000

Wakita, Naohide, Uemura, Tsuyoshi, Ohnishi, Hiroyuki, Ohba, Norriko, Ota, Isao, and Fujita, Shingo, 5,010,327, Cl. 340-784.000

Otis Elevator Company *See*—
Nakai, Kenchiro, and Nakanishi, Yoshinori, 5,009,288, Cl. 187-20.000
Sansevero, Frank M., 5,009,302, Cl. 198-328.000

Oto, Hideki, to Kabushiki Kaisha Toshiba, Television tuner for receiving multiple band television signals, 5,010,400, Cl. 358-86.000

Otokawa, Mitsuhiro *See*—
Hasegawa, Masahide, Otokawa, Mitsuhiro, Matsuoka, Hidetoshi, and Hirata, Noritsugu, 5,010,424, Cl. 360-77.140

Otsuki, Hajime, Kusano, Hideaki, and Kato, Osami, to Minolta Camera Kabushiki Kaisha, Image projecting system, 5,010,362, Cl. 355-74.000

Ott, Gerhard, to Dr. Ing. hc F. Porsche AG, Active spring and damper system, 5,009,400, Cl. 267-64.110

Ott, Karl-Heinz *See*—
Eckel, Thomas, Leitz, Edgar, Wittmann, Dieter, Ott, Karl-Heinz, Peters, Horst, and Schoeps, Jochen, 5,010,135, Cl. 525-63.000

Outboard Marine Corporation *See*—
Meier, Peter W., 5,009,619, Cl. 440-53.000

Outokumpu Oy *See*—
Heimala, Seppo O., Hyvarinen, Olli V. J., and Metsarinta, Marja-Leena, 5,009,870, Cl. 423-239.000

Oven, Tordis B. *See*—
Gautvik, Kaare M., Alestrom, Peter, Oven, Tordis B., and Gabrielsen, Odd S., 5,010,010, Cl. 435-252.300

Overman, Gregg *See*—
West, Michael H., and Overman, Gregg, 5,009,937, Cl. 427-440.000

Owen, Hartley *See*—
Harandi, Mohsen N. and Owen, Hartley, 5,009,859, Cl. 422-189.000

Owens Corning Fiberglas Corporation *See*—
Klett, Paul A., Bakhshi, Shiv K., and Stahl, Steven B., 5,009,962, Cl. 427-243.000
Pollet, Jean-Claude, Williams, Gary L., Armstrong, Gordon P., and Miller, David G., 5,009,941, Cl. 428-36.300

Owens, Mark J. *See*—
Gordon, Herman B., Owens, Mark J., Rubinstein, Leon, and Simpson, Scott, 5,009,607, Cl. 439-67.000

Oy Alko AB *See*—
Palva, Ilkka, 5,010,000, Cl. 435-69.100
Palva, Ilkka, 5,010,035, Cl. 435-320.000

Oy Lampella AB *See*—
Lehto, Jorma, 5,009,736, Cl. 156-250.000

Oyama, Nobuaki *See*—
Akizawa, Nobuyuki, Kudo, Yasunori, Kanai, Toshiyuki, Kamei, Yasuo, Oyama, Nobuaki, and Negishi, Akihito, 5,009,355, Cl. 227-114.000

Oyama, Takuji *See*—
Harano, Takeshi, Takaki, Satoru, Shigesato, Yuzo, Suzuki, Koichi, Hashimoto, Naoki, Kojima, Hiroyasu, and Oyama, Takuji, 5,009,922, Cl. 427-37.000

Ozaki, Yukio *See*—
Hanyu, Masaaki, and Ozaki, Yukio, 5,010,396, Cl. 358-60.000

Ozawa, Masayuki *See*—
Okuda, Hiroshi, and Ozawa, Masayuki, 5,009,209, Cl. 123-415.000

Ozone, Toshio *See*—
Sugimoto, Atsushi, Nakano, Osamu, Yasuda, Shigeru, Maeda, Chikatoshi, Ozone, Toshio, and Kawagoe, Makoto, 5,009,843, Cl. 420-112.000

Pacesetter Infusion, Ltd. *See*—
Gorton, Lanny A., 5,009,641, Cl. 604-131.000

Padget, John C. *See*—
Yeates, Steven G., and Padget, John C., 5,010,121, Cl. 523-336.000

Paersch, Michael J. *See*—
Franke, Friedrich H., and Paersch, Michael J., 5,009,671, Cl. 44-598.000

Paetz, Klaus-Christian *See*—
Serini, Volker, Freitag, Dieter, Westeppe, Uwe, Idel, Karsten, Grigo, Ulrich, Casser, Carl, Paetz, Klaus-Christian, and Hajek, Manfred, 5,010,162, Cl. 528-196.000
Serini, Volker, Freitag, Dieter, Westeppe, Uwe, Idel, Karsten, Grigo, Ulrich, Casser, Carl, Paetz, Klaus-Christian, and Hajek, Manfred, 5,010,163, Cl. 528-196.000

Pajgrt, Jan, Smetak, Vincenc, Kalina, Jaroslav, Zemek, Michal, Pus, Milan, and Bucek, Pavel, to ZVS Vyzkumnevyvojovy ustav, Device for removing a thread, with rotatable ring and rotatable boom for clamping an end of the thread, 5,009,253, Cl. 139-116.200

Paklin, Sergei I. *See*—
Fedin, Marat A., Kuznetsova, Tatyana A., Lysenkov, Viktor I., Novikova, Svetlana A., Savchuk, Valentin A., Sedelnikov, Anatoly I., Shabunya, Vera P., Udarov, Boris G., Tikhonova, Tatyana S., Polyakova, Nina P. and Paklin, Sergei I., 5,010,106, Cl. 514-546.000

Palara, Sergio *See*—
Zisa, Michele and Palara, Sergio, 5,010,439, Cl. 361-91.000

Paley, Martyn N. J., Murdoch, James B., Lampman, David A., and McNally, James M., to Picker International, Inc., Multi-axis pre-saturated spin-echo phase encoded spectroscopy, 5,010,300, Cl. 324-309.000

Palfreyman, Michael G., Wiech, Norbert L., Cheng, Hsien C., and Kane, John M., to Merrell Dow Pharmaceuticals Inc., Lactamimides as calcium antagonists, 5,010,072, Cl. 514-183.000

Pallmann Maschinenfabrik GmbH & Co. KG *See*—
Pallmann, Wilhelm, 5,009,586, Cl. 425-311.000

Pallmann, Wilhelm, to Pallmann Maschinenfabrik GmbH & Co. KG, Agglomerating apparatus for the continuous regranulation of thermoplastic wastes, 5,009,586, Cl. 425-311.000

Palm, Gangolf, Lehmann, Karl-Heinz, and Heinemann, Hans-Joachim, to Peter Wolters AG, Textile-fiber treating grooved roller and a wire with teeth having a foot portion indented for force-fitting the wire into the groove and method of making same, 5,008,979, Cl. 19-97.000

Palva, Ilkka, to Genesit Oy, and Oy Alko AB, Method for the preparation of a selected protein or a part thereof in Bacillus strain bacteria, 5,010,000, Cl. 435-69.100

Palva, Ilkka, to Genesit Oy, and Oy Alko AB, Recombinant DNA-molecules and method for protein production, 5,010,015, Cl. 435-320.000

PanCanadian Petroleum Limited *See*—
Schramm, Laurier L., and Smith, Russell G., 5,009,773, Cl. 208-391.000

Pandrol Jackson, Inc. *See*—
Leach, David J., 5,009,014, Cl. 33-287.000

Panov, Alexandr N. *See*—
Bykhovsky, David G., and Panov, Alexandr N., 5,009,399, Cl. 266-237.000

Pant, Aniket *See*—
Apte, Prasad S., and Pant, Aniket, 5,010,220, Cl. 219-10.55M

Parendel, Marc *See*—
Ringot, Patrice, and Parendel, Marc, 5,009,115, Cl. 74-89.150

Park, Chang M., to Amoco Corporation, Process for the production of trimellitic anhydride with superior color properties, 5,010,207, Cl. 549-245.000

Parken, William D., to Motorola, Inc., Repeater for a wide area coverage system, 5,010,583, Cl. 455-9.000

Parman, Steven E., Artificial lure simulating frog movements, 5,009,024, Cl. 43-42.300

Parmentier, Francois, and Persello, Jacques, to Rhone-Poulenc Chimie, Hydrophobic precipitated silica granules, 5,009,874, Cl. 423-335.000

Parmer, Jerome F. *See*—
Hilal, Mohamed A. and Parmer, Jerome F., 5,010,255, Cl. 307-106.000

Parsons, Bryan N. V., to Jaguar Cars Limited, Mechanism for transmitting rotational motion from one shaft to another, 5,009,114, Cl. 74-15.630

Parsons, James D. *See*—
Bunshah, Rointan F., Parsons, James D., and Stafsudd, Oscar M., 5,010,035, Cl. 437-100.000

Pascal, Jean C., Lee, Chu-Ho, Alps, Brian J., Pinhas, Henri, and Whiting, Roger L., to Syntex Pharmaceuticals Ltd., Substituted imidazolyl-alkyl-piperazine and -diazepine derivatives, 5,010,075, Cl. 514-218.000

Patent Treuhand Gesellschaft fur elektrische Gluhlampen mbH *See*—
Eckhardt, Fritz, Helbig, Peter, and Schoenherr, Walter, 5,010,272, Cl. 313-579.000

Paton, Boris E., Utkin, Vladimir F., Nedoseka, Anatoly Y., Khromyak, Nikolai T., Gorlitsyn, Nikolai V., Tikhy, Viktor G., Mezintsev, Evgeny D., and Mezhuev, Nikolai N., to Institut Elektrosvarki Imeni E.O. Patona Akademii Nauk Ukrainskoi SSR, Apparatus for acoustic-emission inspection of articles, 5,010,503, Cl. 364-569.000

Patterson, Peter M. *See*—
Richardson, David L., Clark, Jack P., Kowdley, Balasubramanian S., Patterson, Peter M., Perry, Richard W., and Smith, Thurman D., 5,009,105, Cl. 73-621.000

Paul, Stanley, to Acrymet Industries Inc., Glass block walls using acrylic or glass filters, 5,009,048, Cl. 52-308.000

Paul Wirth S.A. *See*—
Lonardi, Emile, 5,009,398, Cl. 266-199.000

Pavlov, Valentin P. *See*—
Lipukhin, Jury V., Danilov, Leonid I., Ivoditov, Albert N., Garber, Eduard A., Subbotin, Anatoly N., Pavlov, Valentin P., Zhukov, Jury K., and Pimenov, Alexandr F., 5,009,037, Cl. 51-7.000

Pawlakowitsch, Anton *See*—
Gruenwald, Heinrich, Ramisch, Hans, and Pawlakowitsch, Anton, 5,009,738, Cl. 156-345.000

Pawlikowski, Joseph M. *See*—
Henschen, Homer E., McKee, Michael J., and Pawlikowski, Joseph M., 5,010,233, Cl. 219-209.000

Payne, David B. *See*—
Mortimore, David B., and Payne, David B., 5,010,586, Cl. 455-605.000

Payne, Lyle B. *See*—
Ruder, Carl J., Haney, Ronald J., Chutorash, Richard J., Bostad, Wayne W., Zweig, Arnold A., and Payne, Lyle B., 5,009,560, Cl. 414-392.000

Peace River Arms & Accessories, Inc. *See*—
Butler, Ronnie T., 5,009,346, Cl. 224-205.000

Peck, Lawrence B. *See*—
Clark, Frederick T., Hensley, Albert L., Jr., Lyzinski, David, and Peck, Lawrence B., 5,009,771, Cl. 208-216.0PP

Pedersen, Erik *See*—
Johansen, Keld, Pedersen, Erik, and Tops e, Haldor F. A., 5,010,054, Cl. 505-1.000

Pei-gi, Mao, Jing, Gan, and Bing-huang, Que, Magnetic-controlled valve for fluid pipelines, 5,009,388, Cl. 251-65.000

Pellow, Scott W. *See*—
Rue, Charles V., van de Merwe, Ronald H., Bauer, Ralph, Pellow, Scott W., Cottringer, Thomas E., and Klok, Richard J., 5,009,676, Cl. 51-309.000

Peltzer, Karl *See*—
Wagner, Joachim, Peltzer, Karl, and Rasshofer, Werner, 5,009,950, Cl. 428-290.000

Pember, David A., and Schrader, James R., Potato planter, 5,009,175, Cl. 111-173.000

Pennev, Penio, Rajagopalan, Parthasarathi, and Scribner, Richard M., to Du Pont de Nemours, E. I., and Company, Benzo-fused cycloalkane and oxa- and thia-cycloalkane trans-1,2-diamine derivatives, 5,010,085, Cl. 514-299.000

Pennsylvania Rail Car Company *See*—
Ryan, Walter S., 5,009,036, Cl. 49-485.000

Penny, Glenn S., Stephens, Robert S., and Winslow, Alan R., to Weyerhaeuser Company, Method of supporting fractures in geologic formations and hydraulic fluid composition for same, 5,009,797, Cl. 252-8.551

Perez Blanco, Juan M., to Internacional de Technicas y diseno, S.A., Recreational gymnastic apparatus, 5,009,415, Cl. 272-114.000

Perner, Johannes, Diessel, Paul, Hartmann, Heinrich, Denzinger, Walter, Oftring, Alfred, and Schoenleben, Willibald, to BASF Aktiengesellschaft, Liquid detergent with copolymer additive, 5,009,805, Cl. 252-174.240

Perreau, Philippe *See*—
Lessi, Jacques, Perreau, Philippe, Bary, Daniel, and Grard, Guy, 5,009,512, Cl. 374-6.000

Perrin, Jerry E. *See*—
Bikson, Benjamin, Nelson, Joyce K., and Perrin, Jerry E., 5,009,678, Cl. 55-16.000

Perrot, Friedrich, to ETA SA Fabriques d'Ebauches, Electronic watch having an opening for receiving a battery and a cover closing this opening, and method of mass-producing this watch, 5,010,532, Cl. 368-88.000

Perry, Charles O., Reclining chair, 5,009,466, Cl. 297-323.000

Perry, H. Bruce *See*—
Miller, Bill L., Perry, H. Bruce, and DeGregorio, Robert, 5,009,899, Cl. 426-2.000

Perry, Kathleen A. *See*—
Ku, San-Mei, and Perry, Kathleen A., 5,010,039, Cl. 437-228.000

Perry, Richard W. *See*—
Richardson, David L., Clark, Jack P., Kowdley, Balasubramanian S., Patterson, Peter M., Perry, Richard W., and Smith, Thurman D., 5,009,105, Cl. 73-621.000

Persello, Jacques *See*—
Parmentier, Francois, and Persello, Jacques, 5,009,874, Cl. 423-335.000

Perstorp AB *See*—
Olsson, Lars-Inge R., and Hamacek, Kent F., 5,010,124, Cl. 524-141.000

Peter Wolters AG *See*—
Palm, Gangolf, Lehmann, Karl-Heinz, and Heinemann, Hans-Joachim, 5,008,979, Cl. 19-97.000

Peterhoff, Ralf *See*—
Diebel, Heinz, Peterhoff, Ralf, and Thuemling, Evelyn, 5,010,502, Cl. 364-522.000

Peters, Horst *See*—
Eckel, Thomas, Leitz, Edgar, Wittmann, Dieter, Ott, Karl-Heinz, Peters, Horst, and Schoeps, Jochen, 5,010,135, Cl. 525-63.000

Peters, William E. *See*—
Cowger, Bruce, Dion, John H., and Peters, William E., 5,010,354, Cl. 346-140.00R

Petersen Manufacturing Co., Inc. *See*—
Sorensen, Joseph A., and Gatzemeyer, Dwight L., 5,009,134, Cl. 81-487.000

Peterson, Robert G., Sr. *See*—
Mobley, Dewey F., Peterson, Robert G., Sr., and LaCava, James E., 5,009,615, Cl. 439-595.000

Petit, Laurent, Bournonville, Jean-Paul, Guth, Jean-Louis, Raatz, Francis, and Seive, Alain, to Institut Francais Du Petrole, Catalyst of the gallosilicate type and its utilization for the aromatization of light C_2-C_4 gases, 5,010,048, Cl. 502-61.000

Petree, Edwyn H. *See*—
Sawyer, Alan G., Hughes, Dale L., and Petree, Edwyn H., 5,009,006, Cl. 30-90.600

Petrik, Michael A., Adler, Robert J., and Wineland, Jonathan D., to Adler, Robert, Methods and apparatus for treating a mixture of particles and fluids, 5,009,796, Cl. 210-787.000

Petro-Canada Inc. *See*—
Schramm, Laurier L., and Smith, Russell G., 5,009,773, Cl. 208-391.000

Petroff, Cvetan, to McPherson's Limited, Blade sharpener, 5,009,040, Cl. 51-214.000

Petrohilos, Harry G., to LaserMike, Inc., Miniaturized hand-held laser scanning micrometer, 5,009,243, Cl. 128-666.000

Petrovic, Alexandre. *See*—
Kita, Jean-Claude, Puff, Roger M., Petrovic, Alexandre, and Chretien, Marcel, 5,009,852, Cl. 422-143.000

Pettersen, Jarl M., Nilsson, Arild, and Millroway, Robert M., to Norsk Hydro a.s, Method for clarifying aqueous salt solutions, 5,009,792, Cl. 210-705.000

Pettitt, Edward D. *See*—
Coubeaux, Ronald J., and Pettitt, Edward D., 5,009,734, Cl. 62-115.000

Pfaff, Juergen, to Siemens Aktiengesellschaft, Multi-stage switching network for light waveguides, 5,009,842, Cl. 370-1.000

Pfaffmann, George D., to Torco, Inc., Method and apparatus for selectively heating a workpiece subjected to low temperature thermomechanical processing, 5,009,365, Cl. 266/92.000

Pfeifer, Josef. *See*—
Finter, Jurgen, Hilt, Bruno, Mayer, Carl W., Minder, Ernst, and Pfeifer, Josef, 5,009,832, Cl. 252-500.000

Pfiester, James R., and Havelka, James D., to Motorola, Inc., Semiconductor process using selective deposition, 5,010,... Cl. 437-192.000

Pfizer Inc. *See*—
Urban, Frank J., 5,010,185, Cl. 536-6.100

Phanstiel, Otto IV, and Brown, Sterling B., to General Electric Company, Copolymer containing compositions from substituted triazine capped polyphenylene ethers, 5,010,144, Cl. 525-397.000

Pharmacia Diagnostics Inc. *See*—
Lombardino, Paul A., Saxon, Ronald I., and Supchak, Dennis W., 5,009,561, Cl. 414-412.000

Pharmacology & Toxicology Research Lab. *See*—
Lawrence, Lowell J., Rizzo, Luis O., and Olson, Gene L., 5,009,112, Cl. 73-866.000

Phelps, Bill E. Wrist holster, 5,009,347, Cl. 224-219.000

Phelps, David S. *See*—
Julian, John C., and Phelps, David S., 5,009,141, Cl. 83-657.000

Phillips, Arthur P. *See*
Welch, Richard M., Brown, Alan R., and Phillips, Arthur P., 5,010,088, Cl. 514-112.000

Phillips, Geoffrey J., and George, Kevin F., to Thorn EMI plc, Starter circuits for discharge lamps, 5,10,274, Cl. 315-241.000

Phillips Petroleum Company. *See*—
McDaniel, Max P., 5,010,152, Cl. 526-106.000
Smith, Sanford N., 5,009,333, Cl. 209-615.000
Walker, John H., 5,009,826, Cl. 264-154.000

Phy, William S., to National Semiconductor Gold, tin eutectic bonding for tape automated bonding process, 5,008,897, Cl. 29-827.000

Pian, Silvano, Tamagnone, Gianfranco, Alpini, Raul R., Milani, Mario R., and Fantuz, Marinella, to Alfa Wassermann S.p.A, Heparin-derivatives and process for their preparation, 5,013,063, Cl. 514-56.000

Pichler, Gerald P. *See*
Nash, Stephen E., and Pichler, Gerald P., 5,009,434, Cl. 277-1.000

Picker International, Inc. *See*
Paley, Martyn N. J., Murdoch, James B., Lamprinn, David A., and McNally, James M., 5,010,300, Cl. 324-309.000

Linssen, Johannes L. J. M., and Ployers-Jozef J. A., 5,010,573, Cl. 455-350.000

Plobst, Dietmar. *See*
Klepsch, Wilhelm, and Plobst, Dietmar, 5,009,952, Cl. 428-339.100

Plocek, Edward J., Weiss, Stephen Z., and Pike-Biegunski, Maciej, to Molex Incorporated, Electrical connector assembly for vehicular steering wheel, 5,009,604, Cl. 439-15.000

Plough, Inc. *See*—
McShane, James E., 5,009,446, Cl. 428-35.700

Plude, Christopher J. *See*—
Cederholm, Roger, and Plude, Christopher J., 5,009,740, Cl. 162-271.000

Polak, Bob, to Exxon Research and Engineering Company, Axial gas burner, 5,009,174, Cl. 110-264.000

Polasko, Kenneth J., and Wemple, Ivan L., to General Electric Company, Method for forming Schottky photodiodes, 5,010,... Cl. 437-3.000

Poli Industria Chimica S.p.A. *See*
Poli, Stefano Coppi, Germano, and Del Corona, Lucio, 5,010,105, Cl. 514-619.000

Poli, Stefano Coppi, Germano, and Del Corona, Lucio, to Poli Industria Chimica Spa, N-cyclohalkylaminoethylbenzamide derivatives, their synthesis and pharmaceutical preparations, 5,010,108, Cl. 514-619.000

Polme, Pierre, to GEC Alsthom SA, Vector control system for a squirrel-cage asynchronous electric motor, 5,010,288, Cl. 318-811.000

Pollet, Jean-Claude, Williams, Gary L., Armstrong, Gordon P., and Miller, David G., to Owens-Corning Fiberglas Corporation, Tube or pipe formed a thermoplastic powder impregnated fiberglass roving, 5,009,941, Cl. 428-36.300

Pollock, Thomas J., to Syntro Corporation, Preparation of natural or modified insect toxins, 5,010,001, Cl. 435-69.100

Polyakova, Nina P. *See*—
Fedin, Marat A., Kuznetsova, Tatyana A., Lysenkov, Viktor I., Novikova, Svetlana A., Savchuk, Valentin A., Sedelnikov, Anatoly I., Shanunya, Vera P., Udarov, Boris G., Tikhonova, Tatyana S., Polyakova, Nina P., and Paklin, Sergei I., 5,010,106, Cl. 514-546.000

Ponpipom, Mitree M. *See*—
Bittu, Tesfaye, Chabala, John C., Bugianesi, Robert L., Ponpipom, Mitree M., and Sahoo, Soumya P., 5,010,100, Cl. 514-461.000

Ponzio, Vittorio, to Fabbriche Riunite Misuratori Saccofgas S.p.A, Transducer device, 5,010,334, Cl. 340-870.280

Poole, John S. *See*—
Nickerson, Mark A., Poole, John S., and Frank, Lenore G. R., 5,009,778, Cl. 210-198.200

Popescu, Mircea C., and Mertz, Edgar L., to Liposome Company, Inc., The, Taste moderating composition, 5,009,819, Cl. 264-4.100

Porteous, Don D., Method for preparing finger mountable dispensing cups, 5,009,056, Cl. 53-412.000

Poss, Christopher S. *See*—
Reilly, Kenneth T., Gingerich, Richard G. W., and Poss, Christopher S., 5,009,808, Cl. 252-301.60S

Possin, George E., and Ching-Yeu, Wei, to General Electric Company, Method for fabricating a self-aligned thin-film transistor utilizing planarization and back-side photoresist exposure, 5,010,027, Cl. 437-41.000

Potschin, Roger. *See*
Grob, Ferdinand, Kienzler, Dieter, Linder, Ernst, Potschin, Roger, and Stutzenberger, Heinz, 5,009,064, Cl. 60-276.000

PPG Industries, Inc. *See*—
Johnson, Harlan B., Wiedrich, Charles R., Allen, Ernie L., and Howell, Peter P., 5,009,806, Cl. 252-187.280
Johnson, Harlan B., Laferty, Samuel B., Wagner, Melvin P., and Mohnot, Shantilal M., 5,009,971, Cl. 429-252.000

Pralus, Christian, to Atochem, Consumption of hypochlorite values contained in perchlorate solutions of electrolysis, 5,009,754, Cl. 204-82.000

Prange, Charles J., to Sewer Rodding Equipment Company, Apparatus for monitoring sewer cleaning tool extension, 5,009,242, Cl. 134-113.000

Prejean, Leonard W., Hunting stand system, 5,009,283, Cl. 182-116.000

Premier Industries, Inc. *See*—
Reaves, Thomas A., and Sherritt, John S., 5,009,326, Cl. 220-441.000

Preston, Wallace, to Markel Industries, Inc., and Julie Associates, Inc., Sheet material cleaning machine, 5,008,968, Cl. 15-1.510

Prieels, Jean-Paul, Maschelein, Charles, and Heilporn, Marc, to Synfina-Oleofina, Composition for removing oxygen in foodstuff and drinks, 5,010,007, Cl. 435-190.000

Priester, Donnan E. *See*—
Chapman, George R., Jr., Gorthey, Lee A., and Priester, Donnan E., 5,010,130, Cl. 524-445.000

Printers' Service, Inc. *See*—
Gerson, David, 5,009,716, Cl. 134-40.000

Pritchard, Sally A. *See*—
Ibsen, Robert L., Chadwick, Thomas C., and Pritchard, Sally A., 5,009,709, Cl. 106-35.000

Probiotec (SARL) *See*—
Gavet, Louis, Chatelin, Roger, Sotton, Michel, Guigal, Robert, and Laurent, Philippe, 5,009,846, Cl. 422-56.000

Procter & Gamble Company, The. *See*
Clayton, Simon N., Lambert, Peter M., and Wevers, Jean, 5,009,804, Cl. 252-90.000
Collopoulos, John A., 5,009,916, Cl. 426-615.000
Osborn, Thomas W., III, 5,009,653, Cl. 604-385.100

Proctor & Gamble Company, The. *See*
Degenhardt, Charles R., and Kozikowski, Barbara A., 5,009,882, Cl. 424-52.000

Proprietary Technology, Inc. *See*—
Bartholomew, Donald D., 5,009,454, Cl. 285-24.000

Pruett, Wayne P., Meyer, Max F., Jr., and Breeding, Kenneth F., to Eastman Kodak Company, Dimensionally stable polyester melt blown web, 5,010,165, Cl. 528-272.000

Pruss, Dieter. *See*—
Koch, Edmund, and Pruss, Dieter, 5,009,493, Cl. 350-619.000

Ptaschek, Lawrence, Bowman, James, and Ferguson, H. William, Jr., to NSW Corporation, Inc., Automatic baling machine, 5,009,058, Cl. 53-469.000

Puckett, Robert D. *See*
Gardner, Wallace R., Goodman, Kenneth R., Puckett, Robert D., and Draehn, Ricky L., 5,010,333, Cl. 340-856.000

Puff, Roger M. *See*—
Kita, Jean-Claude, Puff, Roger M., Petrovic, Alexandre, and Chretien, Marcel, 5,009,852, Cl. 422-143.000

Pugatch, Benjamin E. Automotive tool, 5,009,343, Cl. 222-192.000

Pulskamp, Nicholas R. Continuous feed board inserter, 5,009,408, Cl. 270-57.000

Purohit, Kailash. *See*—
Minshall, Billy W., Purohit, Kailash, Nygard, John F., Sintim-Damoa, Kwame, Giesler, Richard, and Woodworth, Archie, 5,009,654, Cl. 604-410.000

Pus, Milan. *See*—
Pajgrt, Jan, Smetak, Vincenc, Kalina, Jaroslav, Zemek, Michal, Pus, Milan, and Bucek, Pavel, 5,009,253, Cl. 139-116.200

Pustek, Frank J. *See*—
Mauro, David J., Furesik, Susan I., Katz, Frances R., Faron, Eugene J., II, Gottneid, David J., and Pustek, Frank J., 5,009,911, Cl. 426-578.000

Pyret, Thomas W., and Gallagher, James L., to Upjohn Company, The, Slip cap for cannula use, 5,009,640, Cl. 604-117.000

Qamar, Sohail S., Conard, Harry W., and Hamilton, Lowell E., to Tosoh SMD, Inc., Sputter target design, 5,009,765, Cl. 204-298.120

Quatattini, Robert J. *See*—
Chuang, Karl T., McMonagle, James B., Quatattini, Robert J., Seddon, William A., and Clegg, David E., 5,009,872, Cl. 423-245.300

Quanscan, Inc. *See*—
West, Paul, Hovsepian, Mirik, and Thomas, Ronald, 5,009,111, Cl. 73-862.610

Quemere, Eric, to Rhone-Poulenc Chimie, Zirconium dioxide gas desulfurization catalyst, 5,010,052, Cl. 502-304.000

Quinn, Anthony W. *See*—
Quinn, F. Dillard, Jr., and Quinn, Anthony W., 5,009,093, Cl. 72-177.000

Quinn, F. Dillard, Jr., and Quinn, Anthony W. Apparatus and method for roll forming and marking sheet metal, 5,009,093, Cl. 72-177.000

R. E. Phelon Company, Inc.: *See*—
Williams, Roger W., Jr., 5,009,588, Cl. 431-31.000

R.W. Technology, Inc.: *See*—
Koski, Greg, 5,010,122, Cl. 524-80.000

Raatz, Francis. *See*—
Petit, Laurent, Bournonville, Jean-Paul, Guth, Jean-Louis, Raatz, Francis, and Serve, Alain, 5,010,048, Cl. 502-61.000

Rach, Petra. *See*—
Bittler, Dieter, Laurent, Henry, Rach, Petra, and Topert, Michael, 5,010,071, Cl. 514-178.000

Rademacher, Wilhelm. *See*—
Keil, Michael, Schirmer, Ulrich, Kast, Juergen, Kolassa, Dieter, Wuerzer, Bruno, Meyer, Norbert, Rademacher, Wilhelm, Jung, Johann, and Carlson, Dale R., 5,009,702, Cl. 71-100.000

Rademachers, Jakob. *See*—
De Cleyn, Rene, Thometzek, Peter, and Rademachers, Jakob, 5,009,879, Cl. 423-610.000

Radkowski, Stanley J. Match head composition and method of making same, 5,009,729, Cl. 149-109.400

Radstone Technology Limited. *See*—
Storrow, Alan J., and Knighton, Nigel J., 5,010,444, Cl. 361-386.000

Rahtz, Dieter. *See*—
Braestrup, Claus T., Nielsen, Mogens C., Christensen, Joergen A., Engelstoft, Mogens, Schou, Henning, Eder, Ulrich, Neef, Gunter, Huth, Andreas, Rahtz, Dieter, and Schmiechen, Ralph, 5,010,077, Cl. 514-228.800

Raikes, Terry E., Kramer, William L., Howard, John H., Moore, Wayne D., Jackson, Louis, and Kotecki, Jeffrey D., to Pitney Bowes Inc. Electronic postal scale with multilingual operator prompts and report headings, 5,009,276, Cl. 177-25.150

Raj, Joseph T., to Evans Automotive, Division of Evans Industries, Inc., Customized automobile, 5,009,938, Cl. 428-31.000

Rajagopalan, Parthasarathi. *See*—
Penney, Penio, Rajagopalan, Parthasarathi, and Scribner, Richard M., 5,010,085, Cl. 514-299.000

Raman, Krishna. *See*—
Cherukuri, Subraman R., Raman, Krishna, Mansukhani, Gul, Cirese, Ralph, and Wong, Lucy L., 5,009,893, Cl. 424-440.000

Ramisch, Hans. *See*—
Gruenwald, Heinrich, Ramisch, Hans, and Pawlakowitsch, Anton, 5,009,738, Cl. 156-345.000

Ramsey, E. Don. Combination backpack and tree stand, 5,009,285, Cl. 182-187.000

Ramshaw, Colin, and Winnington, Terence, to Imperial Chemical Industries plc, and Caradon Mira Ltd. Heat pumps, 5,009,085, Cl. 62-476.000

Randolph-Austin Company, Inc. *See*—
Ring, Gregg, Sr., and Soper, Daniel C., 5,009,573, Cl. 417-53.000

Rasmussen, James M., to Cummins-Allison Corp. Coin sorting mechanism, 5,009,627, Cl. 453-10.000

Rasshofer, Werner. *See*—
Wagner, Joachim, Peltzer, Karl, and Rasshofer, Werner, 5,009,950, Cl. 428-290.000

Raster Technologies, Inc. *See*—
Torborg, John G., Jr., 5,010,515, Cl. 364-900.000

Raszkowski, James A., and Klemen, Donald, to General Motors Corporation, Power transmission with parallel identical countershafts, 5,009,118, Cl. 74-331.000

Raszkowski, James A. *See*—
Ordo, James P., Raszkowski, James A., and Klemen, Donald, 5,009,116, Cl. 74-331.000

Raubenheimer, Hans-Juergen. *See*—
Hennig, Karl, Hartmann, Heinrich, and Raubenheimer, Hans Juergen, 5,010,150, Cl. 526-88.000

Rautaruukki Oy. *See*—
Maenpaa, Matti, Lehtoluoma, Teuvo, Henttinen, Kauko, Jokipalo, Pertti, Saren, Aimo, and Pirinen, Seppo, 5,009,096, Cl. 72-239.000

Raymond, Kenneth N. *See*—
Engelstad, Barry L., Raymond, Kenneth N., Huberty, John P., and White, David I., 5,010,191, Cl. 544-225.000

Raynet Corporation. *See*—
Ellersick, William F., 5,010,293, Cl. 323-278.000

Raytheon Company. *See*—
Greer, James A., 5,010,270, Cl. 310-313.00D

RCA Licensing Corporation. *See*—
Maninger, Loren L., and Marks, Bruce G., 5,010,271, Cl. 313-412.000
Rodriguez-Cavazos, Enrique, 5,010,281, Cl. 315-411.000

Reaves, Thomas A., and Sherritt, John S., to Premier Industries, Inc., Insulated container system for shipping perishable products, 5,009,326, Cl. 220-441.000

Reber, Mark A. *See*—
Cox, Roger G., Reber, Mark A., and Yeager, Michael W., 5,010,509, Cl. 364-748.000

Reddy, V. Butchi, to GTE Products Corporation, Niobium-activated yttrium tantalate x-ray phosphor with improved brightness and method of making same, 5,009,807, Cl. 252-301.40H

Redl, Robert F., to Volpe, Louis J., Jr., Wagner, Steven F., and Kurpiek, Daniel L., Brick line tool, 5,009,015, Cl. 33-409.000

Reeves, Richard R. Tire breaker apparatus for all-terrain vehicle tires, 5,009,257, Cl. 157-1.260

Reflection Technology, Inc. *See*—
Hunter, Gregory H., Wells, Benjamin A., and Feldstein, Michael A., 5,009,473, Cl. 350-6.600

Regnier, Kent, to Molex Incorporated, High density electrical connector for printed circuit boards, 5,009,611, Cl. 439-326.000

Reich, Harry, and Koch, Peter, to Richard Wolf Medical Instruments Corp. Self-retaining electrically insulative trocar sleeve and trocar 5,009,643, Cl. 604-165.000

Reich, Reuven *See*—
Fuller, George C., Martin, George R., Mueller, Richard A., and Reich, Reuven, 5,010,080, Cl. 514-255.000.

Reichman, Karl-Heinz, and Krumb, Heinrich W., to General Motors Corporation Headlight support 5,010,456, Cl. 362-61.000.

Reid, Alexander D. Dart for aiming at a game board 5,009,433, Cl. 273-419.000

Reid, Lee R., and Yuan, Han-Tzong, to Texas Instruments Incorporated. Semiconductor layer with optical communication between chips disposed therein. 5,009,476, Cl. 350-96.110

Reiher, Uwe *See*—
Springer, Hartmut; and Reiher, Uwe, 5,010,180, Cl. 534-638.000

Reiland, Thomas L. *See*—
Brinker, Dale R., and Reiland, Thomas L., 5,009,897, Cl. 424-469.000

Reilly, Kenneth T., Gingerich, Richard G. W. and Poss, Christopher S., to GTE Products Corporation. Process for producing electroluminescent yellow zinc sulfide phosphors. 5,009,808, Cl. 252-301.60S

Reimels, Harry G., to Mentor O&O Inc. Bipolar electrosurgical instrument 5,009,656, Cl. 606-48.000

Reimers, Paul P. Float controlled switch 5,010,218, Cl. 200-84.00R

Reiner, Josef, to Oculus Optikgeraete GmbH. Prism system for a stereoscopic microscope. 5,009,487, Cl. 350-286.000

Reisman, Arnold, Nayak, Deepak, and Turlik, Iwona, to MCNC Metal-to-metal bonding method and resulting structure 5,009,360, Cl. 228-198.000

Reiss, Kurt *See*—
Sprintschnik, Gerhard, Niederstaetter, Walter, Reiss, Kurt, von Asten, Wolfgang, Scharf, Gunther, and Grzembra, Barbara, 5,009,722, Cl. 148-2.000

Remus, Christian *See*—
Wider, Michael, Rossio, Charles, and Remus, Christian, 5,009,801, Cl. 252-033.200.

Renaker, John J., Jr. *See*—
Bustamante, Michael R., Renaker, John J., Jr. and Magley, Donald A., 5,009,790, Cl. 210-689.000

Rende, Giorgio *See*—
Antonaroli, Simonetta, Bianco, Armandodariano, Brufani, Mario, Lo Baido, Giuseppe, and Rende, Giorgio, 5,010,204, Cl. 548-128.000

Rene, Didier, Dusseux, Thierry, and Ginestet, Philippe, to Alcatel Espace. Device for exciting a waveguide with circular polarization from a plane antenna. 5,010,348, Cl. 343-700.0MS

Research Development Corporation of Japan *See*—
Hayashi, Yutaka; Itoh, Atuo, Imai, Mizuho, and Iida, Hideyo, 5,009,928, Cl. 427-126.300

Research Foundation of State University of N.Y., The *See*—
Kalman, Thomas I., 5,010,103, Cl. 514-495.000

Respironics Inc. *See*—
Searberry, Eugene N., 5,009,635, Cl. 604-27.000

Rettie, C. William. Rotary cutter device 5,009,138, Cl. 83-413.000

Rettig, Helmut; Weiss, Karl, and Buss, Erich, to Uni-Cardan Aktiengesellschaft. Apparatus and method for fitting a protective boot particularly for articulated joint assemblies 5,008,994, Cl. 29-235.000

Rheinmetall GmbH *See*—
Sippel, Achim; Kruse, Heinz-Josef, and Becker, Wilfried, 5,009,167, Cl. 102-524.000.

Rhone-Poulenc Chimie *See*—
Parmentier, Francois, and Persello, Jacques, 5,009,874, Cl. 423-335.000
Quemere, Eric, 5,010,052, Cl. 502-304.000

Rhone-Poulenc Specialties Chimiques *See*—
Cros, Patrick, and Pipon, Robert, 5,010,186, Cl. 536-114.000

Richard, Carl E. *See*—
Viazmensky, Helen; Richard, Carl E.; and Williamson, James E., 5,009,747, Cl. 162-115.000

Richard, David L. Roping practice apparatus 5,009,432, Cl. 273-339.000

Richard Wolf Medical Instruments Corp. *See*—
Reich, Harry, and Koch, Peter, 5,009,643, Cl. 604-165.000

Richards, Michael J. *See*—
Leach, Robert M., and Richards, Michael J., 5,009,964, Cl. 428-526.000.

Richardson, Curtis G., to Maytag Corporation. Mounting assembly for the impeller of a fluid pump. 5,009,570, Cl. 415-174.200.

Richardson, David L., Clark, Jack P., Kowdley, Balasubramanian S., Patterson, Peter M., Perry, Richard W., and Smith, Thurman D., to General Electric Company. Apparatus for ultrasonic examination of BWR shroud access cover plate retaining welds 5,009,105, Cl. 73-621.000.

Ricoh Company, Ltd. *See*—
Kasahara, Nobuo, Watanuki, Masayoshi, Maeno, Satoru, and Ohkuni, Masato, 5,010,372, Cl. 355-313.000

Riebli, Peter, to Ciba-Geigy Corporation. Pesticidal 2-hydrazinopyramidine compounds. 5,010,082, Cl. 514-272.000

Riedweg, Robert, and Schlensog, Klaus, to Ameda AG. Breast pump 5,009,638, Cl. 604-74.000

Ries, Stanley K., Wert, Violet F., and Nair, Muraleedharan G., to Board of Trustees operating Michigan State University. Method for stimulating plant growth using synthetically produced 9-beta-D(+) adenosine 5,009,698, Cl. 71-92.000

Riffe, William J., and Carter, Jack D., Jr., to Marine Environmental Research, Inc. Electrochemical system for the prevention of fouling on steel structures in seawater. 5,009,757, Cl. 204-147.000

Riley, Thomas P., to United States of America, Navy. Magnetic coupler for electroacoustic hydrophones 5,010,530, Cl. 367-154.000

Ring, Gregg, Sr., and Soper, Daniel C., to Randolph Austin Company, Inc. Variable occlusion peristaltic apparatus and method 5,009,573, Cl. 417-53.000

Ringot, Patrice, and Parendel, Marc, to Neyrpic Framatome Mecanique. Device for driving in rotation a structure of large diameter particularly an antenna. 5,009,115, Cl. 74-89.150

Ringwood, Alfred E., to Australian National University, The. Production of diamond compacts consisting essentially of diamond crystals bonded by silicon carbide 5,010,043, Cl. 501-90.000

Rion Kabushiki Kaisha *See*—
Marutake, Yozo, Fukutome, Tatsuro; and Asami, Motomu, 5,010,575, Cl. 381-68.000

Risa, Steinar *See*—
Molaug, Ole, and Risa, Steinar, 5,009,908, Cl. 426-454.000

Rishworth, Denis L. *See*—
Rishworth, Paul L., Rishworth, Denis L., and Dixon, Daniel A., 5,009,612, Cl. 439-403.000

Rishworth, Paul L., Rishworth, Denis L., and Dixon, Daniel A., to Molex Incorporated. Multi-conductor electrical cable connector 5,009,612, Cl. 439-403.000.

Riso Kagaku Corporation *See*—
Hasegawa, Takanori, Abe, Nobuyuki, Hibara, Toru, Hirose, Toshihiko, Kanda, Takashi, Saito, Hiroshi, Oshima, Masaki, and Nakazawa, Eiji, 5,010,420, Cl. 358-471.000

Rispoli, Joseph M. *See*—
Saslaw, Irving M., Topalian, Harry H., and Rispoli, Joseph M., 5,009,904, Cl. 426-243.000

Rite Lite Partnership *See*—
Erlendsson, Gudni, and Hjaltason, Thorgeir D., 5,009,019, Cl. 40-541.000

Robare, Douglas F. F. Container carrier 5,009,315, Cl. 206-427.000

Robert Bosch GmbH. *See*—
Fedter, Horst; Grunwald, Werner, Nolting, Peter, de la Prieta, Claudio, and Schmid, Kurt, 5,010,315, Cl. 338-7.000
Grob, Ferdinand, Kienzler, Dieter, Linder, Ernst, Potschin, Roger, and Stutzenberger, Heinz, 5,009,064, Cl. 60-276.000
Grunwald, Werner, Holfelder, Gerhard, De La Prieta, Claudio and Schmid, Kurt, 5,009,708, Cl. 106-105.000

Robert Bosch Power Tool Corporation *See*—
Martinez, David M., and Campbell, Gordon C., 5,009,012, Cl. 30-394.000.

Roberts, David A. *See*—
Ellison, Thomas L., Roberts, David A., Ivankovits, John C., and Norman, John A. T., 5,009,725, Cl. 148-23.000

Branam, Timothy R., Roberts, Jeffrey J., and Schoenberger, Jack O., 5,009,101, Cl. 73-168.000.

Robertson, Martha H. *See*—
McElrath, Kenneth O., Jr., Robertson, Martha H., and Chow, Wai Yan, 5,010,119, Cl. 523-205.000.

Robins, Kendall H., Austin, Dennis K., and Spraggs, Richard W., to Ensign-Bickford Company, The. Non-electric signal transmission device connection, method and apparatus therefor 5,009,163, Cl. 102-301.000.

Robinson, Dennis W., to Spafax Holdings Plc. Method of producing an optical component, and components formed thereby 5,009,761, Cl. 204-192.140

Robinson, Irwin J., III *See*—
Janney, Mark A., Newey, Roger, and Robinson, Irwin J., III, 5,010,560, Cl. 377-20.000

Robwen, Inc. *See*—
Grindley, John R., and Grindley, Robert M., 5,009,244, Cl. 137-101.110

Rockefeller University, The *See*—
Kappas, Attallah, and Drummond, George S., 5,010,073, Cl. 514-185.000.

Rockwell International Corporation *See*—
Green, Paul E., 5,010,340, Cl. 341-172.000
Hrnciric, Dennis J., 5,010,506, Cl. 364-721.000

Rockwell, Marshall A., III. Optical waveguide display system 5,009,483, Cl. 350-96.240

Rockwool Lapinus B.V. *See*—
Knop, Albert W., and van Banning, Robert J. H. M., 5,009,031, Cl. 47-64.000

Rode, Leon A. *See*—
Roderick, Zackary A., and Rode, Leon A., 5,009,306, Cl. 198-414.000

Roderick, Zackary A., and Rode, Leon A., to Simplimatic Engineering Company. Printed circuit board conveyor and method 5,009,306, Cl. 198-414.000

Rodgers, Cyril. *See*—
Fay, Fredric S., Fogarty, Kevin F., and Rodgers, Cyril, 5,009,488, Cl. 350-315.000

Rodriguez-Cavazos, Enrique, to RCA Licensing Corporation. High voltage stabilization circuit for video display apparatus 5,010,281, Cl. 315-411.000

Roe, William J. *See*—
Kerr, E. Michael, Connelly, Lawrence J., Roe, William J., and Vallowe, Robert M., 5,009,873, Cl. 423-320.000

Roeske, Robert G. *See*—
Luallin, John M., Nagengast, William E.; and Roeske, Robert G., 5,010,455, Cl. 362-61.000

Rogers Corporation *See*—
Gordon, Herman B., Owens, Mark J., Rubinstein, Leon; and Simpson, Scott, 5,009,607, Cl. 439-67.000.

Rogge, Dieter, and Wallmann, Wilfried, to Windmoller & Holscher. Rotary press comprising an endless block belt 5,009,157, Cl. 101-178.000

Rohrer, Kurt *See*—
Gugel, Bernd; Kaufmann, Clemens, Kitzberger, Herbert, and Rohrer, Kurt, 5,009,529, Cl. 400-124.000

Roland Corporation *See*—
Yamamori, Takenori, 5,009,147, Cl. 84-618.000

Roldan, Antoine, and Demilliere-Vergnais, Daniel, to Application Des Gaz. Hot air generating device with a catalytic burner 5,009,592, Cl. 432-222.000

Roll, Daniel O. *See*—
Hawkins, William G., Burke, Cathie J., Roll, Daniel O., Hartman, Pamela J., and Atkinson, Diane, 5,010,355, Cl. 346-140.00R.

Roller, Timothy J., and Thiele, Robert E., to Adanlock. Lateral file drawer position lock 5,009,470, Cl. 312-325.000

Romig, Kenneth L., to General Motors Corporation. Anti-rotation device for the release bearing of a manually operated clutch 5,009,300, Cl. 192-98.000

Ron, Eyal; Staubli, Andrea; and Langer, Robert S., to Massachusetts Institute of Technology. Polytamide-and imide-co-anhydride) for biological application 5,010,167, Cl. 528-328.000

Ronsen, Bruce, Arora, Sudershan K., and Thomas, Albert V., to 501 Greenwich Pharmaceuticals Incorporated. 3,5,6-substituted derivatives of 1,2-O-isopropylidene-α,D-glucofuranose and intermediates for preparing these derivatives 5,010,058, Cl. 514-23.000

Roobeek, Cornelis F. *See*—
Van Leeuwen, Petrus W. N. M., and Roobeek, Cornelis F., 5,010,172, Cl. 528-392.000

Roodenburg, Hendrik F. *See*—
Roodenburg, Joop, and Roodenburg, Hendrik F., 5,009,412, Cl. 272-2.000

Roodenburg, Joop, and Roodenburg, Hendrik F., to Itrec B.V. Earthquake simulator for a theme park 5,009,412, Cl. 272-2.000

Roos, Antonius, to Akzo N.V. Process for manufacturing yarns by meltspinning polyethylene terephthalate 5,009,829, Cl. 264-210.600

Roquette Freres *See*—
Serpelloni, Michel, 5,009,914, Cl. 426-582.000

Rosenbrand, Gerrit G., and Wong, Pui K., to Shell Oil Company. Polymerization of carbon monoxide/olefin with at least one tetra aryl diphosphine ligand 5,010,170, Cl. 528-392.000

Rosenthal, Eugene J. *See*—
Kutzavitch, Walter G., and Rosenthal, Eugene J., 5,010,306, Cl. 330-284.000

Ross, David I. Electrified bulletin board with illuminable push-pin 5,010,463, Cl. 362-253.000

Ross, Lawrence M. Bow draw stop 5,009,216, Cl. 124-88.000

Rossio, Charles *See*—
Wider, Michael, Rossio, Charles, and Remus, Christian, 5,009,801, Cl. 252-033.200

Rostra Engineered Components *See*—
Motykiewicz, Krystyn, 5,010,312, Cl. 335-261.000

Rothgery, Eugene F., to Olin Corporation. Use of pyrithione for the control of moss 5,009,700, Cl. 71-94.000

Rottman, Fritz M. *See*—
Schuler, Linda A., Gorski, Jack, Hurley, Walter L., Bremel, Robert D., and Rottman, Fritz M., 5,010,011, Cl. 435-252.300

Rouillot, Michel, to Glaenzer-Spicer. Body having a composite structure for a transmission joint and its method of production 5,009,628, Cl. 464-111.000

Roumeliotis, Panayiotis *See*—
Speck, Ulrich, and Roumeliotis, Panayiotis, 5,010,061, Cl. 514-54.000.

Rousset, Joseph *See*—
Scherrer, Fernand; and Rousset, Joseph, 5,010,234, Cl. 219-213.000

Roy, Michael A. *See*—
Abu-Isa, Ismat A.; Eusebi, Elio; Jaynes, Craig B., Moran, Susan C., and Roy, Michael A., 5,009,827, Cl. 264-156.000

Ruback, Wulf *See*—
Kelkenberg, Heike, Ruback, Wulf, and Engel, Klaus, 5,009,814, Cl. 252-548.000

Rubinstein, Leon *See*—
Gordon, Herman B., Owens, Mark J., Rubinstein, Leon, and Simpson, Scott, 5,009,607, Cl. 439-67.000

Ruder, Carl J., Haney, Ronald J., Chutorash, Richard J., Bostad, Wayne W., Zweig, Arnold A., and Payne, Lyle B., to Yellow Freight System, Inc. Mixed freight handling system 5,009,560, Cl. 414-392.000

Rudy, Wayne M., to Engelhard Corporation. Staged three-way conversion catalyst and method of using the same 5,010,051, Cl. 502-304.000

Rue, Charles V., van de Merwe, Ronald H.; Bauer, Ralph, Pellow, Scott W., Cottringer, Thomas E., and Klok, Richard J., to Norton Company. Sintered sol gel alumina abrasive filaments 5,009,676, Cl. 51-309.000

Rueb, Lothar *See*—
Plath, Peter, Eicken, Karl; Rueb, Lothar, Schwalge, Barbara, Westphalen, Karl-Otto, and Wuerzer, Bruno, 5,009,701, Cl. 71-96.000

Ruffo, Giorgio, and Vezzani, Luciano, to Vezzani S.p.A. Process for recycling and reutilizing waste, in particular solid urban waste 5,009,672, Cl. 44-593.000

Rullier, Pierre. *See*—
Laudet, Jean-Luc, and Rullier, Pierre, 5,008,986, Cl. 24-289.000

Ruppert, Heinrich W. *See*—
Schmidt, Ernst, Stehmeier, Heinz, Ruppert, Heinrich W., Gatschmann, Klaus G.; and Schutze, Gunter, 5,009,237, Cl. 131-70.000

Rutges, Antonius A. *See*—
De Rycke, Gino L., Rutges, Antonius A., and De Prijcker, Jozef P., 5,009,984, Cl. 430-404.000

Rutledge, Gary L., to Marrelli, John C. Plastic film bag with integral plastic film tie element, and associated fabrication methods 5,009,517, Cl. 383-72.000

Rutter, William J., and Santi, Daniel V., to University of California, The Regents of the. General method for producing and selecting peptides with specific properties 5,010,175, Cl. 530-334.000

Ruzo, Luis O. *See*—
Lawrence, Lowell J., Ruzo, Luis O., and Olson, Gene L., 5,009,112, Cl. 73-866.000

Ryan, Walter S., to Pennsylvania Rail Car Company. Box car door seal 5,009,036, Cl. 49-485.000

Rzechula, Michael J., to Sleik Ice Limited. Additive composition for treating water used to form ice and methods 5,010,127, Cl. 524-379.000

S. C. Johnson & Son, Inc. *See*—
Scholsky, Kevin M., Larsen, Lisa M., and Kruse, Rodger C., 5,010,166, Cl. 528-323.000

Sacco, Bruno, Tomforde, Johann, Abb, Thomas, and Stenemann, Bruno, to Daimler-Benz AG. Modular display system 5,009,042, Cl. 52-36.000

Sacks, Michael D., and Lee, Hae-Weon, to University of Florida. Alumina or alumina/zirconia-silicon carbide whisker ceramic composites and methods of manufacture 5,009,822, Cl. 264-23.000

Sadler, Thomas E. Bed mounted television stand 5,009,379, Cl. 248-174.000

Saepter Manufacturing Company Limited *See*—
Arthurs, Raymond C., 5,009,314, Cl. 206-427.000

Sahi, Carl R., to Bio-Plexus, Inc. Self-blunting needle assembly for use with a catheter, and catheter assembly using the same 5,009,642, Cl. 604-158.000

Sahira, Kensho *See*—
Kida, Michio, Arai, Yoshiaki, and Sahira, Kensho, 5,009,862, Cl. 422-249.000

Sahoo, Soumya P. *See*—
Biftu, Tesfaye, Chabala, John C., Bugianesi, Robert L., Ponpipom, Mitree M., and Sahoo, Soumya P., 5,010,100, Cl. 514-461.000

Saint-Gobain Vitrage *See*—
Kuster, Hans-Werner, and Vanaschen, Luc, 5,009,695, Cl. 65-182.200

Saishoji, Toshihide *See*—
Enari, Hiroyuki, Kumazawa, Satoru, Shimizu, Susumu, Ito, Atsushi, Sato, Nobuo, and Saishoji, Toshihide, 5,010,206, Cl. 548-262.200

Saito, Hiroshi *See*—
Hasegawa, Takanori, Abe, Nobuyuki, Hibara, Toru, Hirose, Toshihiko, Kanda, Takashi, Saito, Hiroshi, Oshima, Masaki, and Nakazawa, Eiji, 5,010,420, Cl. 358-471.000

Saito, Isao *See*—
Yamauchi, Hiroshi; Sugiyama, Isao, Saito, Isao, Nomoto, Seiichiro, Kamiya, Takashi, Machida, Yoshimasa, and Negi, Shigeto, 5,010,188, Cl. 540-222.000

Saito, Kenji, to Fuji Photo Film Co., Ltd. Method and apparatus for adjusting chroma 5,010,393, Cl. 358-29.000

Saito, Koji. *See*—
Sato, Izumi, Saito, Koji, and Inoue, Takashi, 5,009,103, Cl. 73-597.000.

Saito, Makoto *See*—
Nakagawa, Toyoaki, Sanbuichi, Hiroshi, Terasaka, Katsunori, and Saito, Makoto, 5,009,210, Cl. 123-489.000

Saitoh, Masahiro, Yoshida, Suguru, Obata, Keiichi, and Ono, Yoshinobu, to Honda Giken Kogyo Kabushiki Kaisha. Reinforced plastic automobile body structure 5,009,463, Cl. 296-210.000

Sakae Riken Kogyo Co., Ltd. *See*—
Watanabe, Toshiharu, 5,009,020, Cl. 40-547.000

Sakaegi, Yuji, and Fukushima, Nobuo, to Canon Kabushiki Kaisha. Tracking device and method 5,010,423, Cl. 360-77.060

Sakaguchi, Yoshikazu *See*—
Harada, Kyouji, Kato, Eiji, Sakaguchi, Yoshikazu, Watanabe, Suzuaki, and Hoshino, Akira, 5,009,290, Cl. 188-71.500

Sakai, Jun *See*—
Yamamoto, Takemi, Nagata, Osamu, Komiya, Ryohei, Sakai, Jun, and Ban, Yoshiyuki, 5,010,360, Cl. 355-20.000

Sakai, Kazuo *See*—
Nishimura, Kohsuke; and Sakai, Kazuo, 5,010,376, Cl. 357-17.000

Sakai, Kunihiro *See*—
Eguchi, Ken, Kawada, Haruki, Sakai, Kunihiro, Tomida, Yoshinori, Matsuda, Hiroshi, Tsuboyama, Akira, Takimoto, Kiyoshi, and Takamatsu, Osamu, 5,009,489, Cl. 350-341.000.

Sakai, Mieko Process for fabricating a circular frame 5,009,733, Cl. 156-184.000

Sakai, Takashi *See*—
Kuzuya, Susumu, Shimizu, Seiji, Kato, Mikio, Ishikawa, Yujiro Sakai, Takashi, and Yuki, Eiji, 5,009,530, Cl. 400-188.000

Sakai, Yuji *See*—
Yamada, Takehito, Tanimoto, Kazushi, Sakai, Yuji, Muraoka, Takao, Inoue, Tetsuo, and Takada, Yoshinao, 5,010,430, Cl 360-103 000

Sakakibara, Yoshikazu *See*—
Kuki, Nobuyuki, Isomura, Yukio, Suzumura, Hirokazu, Sakakibara, Yoshikazu, and Ishihara, Hiroshi, 5,009,035, Cl 49-352 000

Sakamaki, Iwao, to Sakamaki Mfg Co, Ltd Chuck for tools 5,009,439, Cl 279-62 000

Sakamaki Mfg Co, Ltd *See*—
Sakamaki, Iwao, 5,009,439, Cl 279-62 000

Sakamoto, Hiroaki, Fujikura, Masahiro, and Mukai, Toshio, to Nippon Steel Corporation Rare-earth antisotropic powders and magnets and their manufacturing processes 5,009,706, Cl 75-244 000

Sakamoto, Ken *See*—
Kawakami, Toshikatsu, Fukuda, Shin, Shinbo, Hiroyasu, Unemura, Toyoaki, Sakamoto, Ken, and Kondo, Tomoji, 5,010,406, Cl 358-147 000

Sakanishi, Masayuki, and Ishii, Takaaki, to Kabushiki Kaisha Toshiba Electronic volume device 5,010,577, Cl 381-104 000

Sakano, Akio *See*—
Yoshida, Kimiyoshi, Sakano, Akio, Tamori, Hirofumi, and Chatani, Masayuki, 5,010,579, Cl 382-13 000

Tanaka, Kazuyuki, Iwami, Etsuji, Matsuzawa, Jun, Mukoyama, Yoshiyuki, Shibata, Norihiko, Hanawa, Akinori, and Yokota, Mitsuo, 5,009,949, Cl 428-260.000

Shibazaki, Nobuo, to Canon Kabushiki Kaisha Document processing system 5,010,496, Cl 364-519.000

Shiga, Nobuo, to Sumitomo Electric Industries, Ltd Microwave integrated circuit 5,010,305, Cl 330-277.000

Shigeno, Haruhisa *See—*
Yamanaka, Masahiko, Hanaoka, Motoyoshi, Konse, Hiroaki, Shigeno, Haruhisa, and Kinoshita, Masakatsu, 5,009,936, Cl 427-407.100

Shigesato, Yuzo *See—*
Harano, Takeshi, Takaki, Satoru, Shigesato, Yuzo, Suzuki, Koichi, Hashimoto, Naoki, Kojima, Hiroyasu, and Oyama, Takuji, 5,009,922, Cl 427-37.000

Shigeta, Katsunori, and Nakamura, Haruyuki, to Mitsubishi Denki K K Sewing data forming method and device for sewing machine 5,009,176, Cl 112-121.120

Shih, I-Fu, Chang, David B , Arns, James A , Moss, Gaylord E , and Smith, Ronald T , to Hughes Aircraft Company System of holographic optical elements for testing laser range finders 5,009,502, Cl 356-152.000

Shiki, Masatoshi *See—*
Migita, Masahito, Uda, Tsuyoshi, Kanehisa, Osam, and Shiki, Masatoshi, 5,010,517, Cl 365-114.000

Shikichi, Satoshi *See—*
Enari, Masahiko, Shikichi, Satoshi, Kawaguchi, Fumiaki, Suzuki, Kenichi, Usui, Masayuki, Matsuoka, Hiroshi, Matsuoka, Kazuhiko, Hosoya, Hideki, Aoki, Akio, and Minoura, Kazuo, 5,010,534, Cl 369-32.000

Shima, Yoshinobu, and Kamio, Hiroshi, to NKK Corporation Apparatus for manufacturing silicon single crystals 5,009,863, Cl 422-249.000

Shimada, Akira, to Hitachi, Ltd Image information recorder having a resolution density transformation device 5,010,497, Cl 364-519.000

Shimada, Satoshi, and Watanabe, Yuji, to Sony Corporation Video display system 5,010,411, Cl 358-230.000

Shimamura, Masato *See—*
Sasaki, Hiroyuki, Shimamura, Masato, Noda, Juichi, Hanafusa, Hiroaki, and Takeuchi, Yoshiaki, 5,009,478, Cl 350-96.150

Shimano Industrial Company Limited *See—*
Nagano, Masashi, 5,009,119, Cl 74-489.000

Shimizu, Masayasu *See—*
Noda, Hidetoshi, Gocho, Makoto, Shimizu, Masayasu, Komatsu, Osamu, and Inoue, Hideaki, 5,009,707, Cl 75-375.000

Shimizu, Noboru *See—*
Kitada, Masahiro, Shimizu, Noboru, Tanabe, Hideo, and Nakamura, Hitoshi, 5,010,433, Cl 360-113.000

Shimizu, Seiji *See—*
Kuzuya, Susumu, Shimizu, Seiji, Kato, Mikio, Ishikawa, Yujiro, Sakai, Takashi, and Yuki, Eiji, 5,009,530, Cl 400-188.000

Shimizu, Shigeru *See—*
Nakamura, Tomio, Shimizu, Shigeru, and Takeuchi, Kikuko, 5,009,811, Cl 252-500.000

Shimizu, Susumu *See—*
Enari, Hiroyuki, Kumazawa, Satoru, Shimizu, Susumu, Ito, Atsushi, Sato, Nobuo, and Saishoji, Toshihide, 5,010,206, Cl 548-262.200

Shimizu, Tokihiko *See—*
Wakita, Katsuya, Sonoda, Nobuo, Shimizu, Tokihiko, Hotta, Shu, and Soga, Mamoru, 5,009,815, Cl 252-582.000

Shimokawahara, Hisashi *See—*
Maruyama, Hiroshi, Kiryu, Naohiko, Minezaki, Etsuko, Tagashira, Susumu, and Shimokawahara, Hisashi, 5,009,944, Cl 428-40.000

Shimokoriyama, Makoto, and Yagisawa, Toshihiro, to Canon Kabushiki Kaisha Digital video signal processing device 5,010,391, Cl 358-14.000

Shimozawa, Kenji *See—*
Tsuyuguchi, Hiroshi, Noda, Yasushi, Morita, Tsutomu, and Shimozawa, Kenji, 5,010,246, Cl 250-216.000

Shin-Etsu Handotai Company Limited *See—*
Ibe, Hiroyuki, and Uesugi, Toshiharu, 5,009,864, Cl 422-249.000
Ikeda, Yasuhiro, 5,009,860, Cl 422-250.000

Shin, Yuaki *See—*
Arai, Yuji, Shin, Yuaki, Ishiguro, Takashi, and Hamada, Emiko, 5,009,818, Cl 264-1.003

Shinbo, Hiroyasu *See—*
Kawakami, Toshikatsu, Fukuda, Shin, Shinbo, Hiroyasu, Unemura, Toyoaki, Sakamoto, Ken, and Kondo, Tomoji, 5,010,406, Cl 358-147.000

Shingai, Sadanori *See—*
Mori, Kinji, Kunai, Yuko, Akiyama, Masakazu, Kadoya, Tadaaki, Kawano, Katsumi, Miyamoto, Shoji, Nohmi, Makoto, Shingai, Sadanori, and Ihara, Hirokazu, 5,010,479, Cl 364-200.000

Shinko Electric Co., Ltd *See—*
Kasahara, Nobuo, Watanuki, Masayoshi, Maeno, Satoru, and Ohkuni, Masato, 5,010,372, Cl 355-313.000
Nakagawa, Hiroshi, and Maeda, Minoru, 5,010,262, Cl 310-12.000.

Shinobu, Yoshiharu *See—*
Tanaka, Syozo, Takushima, Akiro, Shinobu, Yoshiharu, and Eguchi, Masaki, 5,009,084, Cl 62-441.000

Shinohara, Tadashi, Nishiyama, Toshikazu, Noguchi, Kazumi, Iwata, Hitoshi, and Suwabe, Shigekazu, to Hitachi Metals, Ltd Flying-type composite magnetic head. 5,010,431, Cl 360-103.000

Shioda, Atsushi *See—*
Morita, Kaoru, and Shioda, Atsushi, 5,010,149, Cl 525-481.000

Shiokawa, Youichi, Takimoto, Koichi, and Takenaka, Kohei, to Fujisawa Pharmaceutical Co , Ltd Nitric ester derivative 5,010,093, Cl 514-374.000

Shiotani, Shinobu *See—*
Suzuki, Hitoshi, Shiotani, Shinobu, Tokunaga, Shinji, Hirai, Tokuyuki, Fukumochi, Yoji, Kugimiya, Shuzo, and Sata, Ichiko, 5,010,486, Cl 364-419.000

Shioyama, Tsutomu, Minakami, Ko, Fujii, Takao, and Ohtomi, Koichi, to Kabushiki Kaisha Toshiba Internal pump for nuclear reactor 5,009,838, Cl 376-310.000

Shipe, Joanne E , to AMP Incorporated Separable connector assembly for an IC Chip Carrier 5,009,608, Cl 439-331.000

Shirai, Junji *See—*
Hirano, Yoshinao, Sato, Katsumo, Nagamori, Shigeru, Murata, Katsuhide, Horikiri, Kazuhito, and Shirai, Junji, 5,009,585, Cl 425-174.400

Shirai, Tadayoshi, and Hioki, Masahito, to Ishikawa Tekko Kabushiki Kaisha Ball joint 5,009,538, Cl 403-134.000

Shiraki, Masaru *See—*
Kosugi, Yoshitsugu, Tanaka, Hideoki, Suzuki, Hideo, and Shiraki, Masaru, 5,010,004, Cl 435-134.000

Shirakura, Keizo *See—*

Siemens Automotive Limited *See*—
Hueniken, Peter Gurd, John A. and Woodman, Douglas, 5,010,217, Cl. 200-61.45R

Siemens-Bendix Automotive Electronics Limited *See*—
Sewell, Michael R. and DeJong, Allan W., 5,010,216, Cl. 200-61.45M

Siemens Medical Laboratories, Inc. *See*—
Hernandez, Francisco, and Chamberlain, Jerry, 5,010,562, Cl. 378-125.000

Siener, Pierre, and Steiner, Antoine, to Institut de Recherches de la Siderurgie Francaise-Irsid. Method and apparatus for the identification of metal surface finishes, 5,010,578, Cl. 382-8.000

Sievers, Uve, to Mecron Medizinische Produkte GmbH. Marrow nail for the treatment of bone fractures, 5,009,664, Cl. 623-16.000

Sikkema, Doetze J., to Akzo nv. Aramid polymer from aromatic diacarboxylic acid mixture and aromatic diamine mixture, 5,010,168, Cl. 528-338.000

Silbermann, Klaus *See*—
Hirtle, Thomas W., Cimperman, Frederick J. and Silbermann, Klaus, 5,009,909, Cl. 426-481.000

Silver, Jules, and Tarozzi, Richard A. Syringe for dispensing measured quantities of a material, 5,009,645, Cl. 604-207.000

Silvia, Denis A., to United States of America, Navy. Explosive logic resolver network, 5,009,162, Cl. 102-275.900

Simmons, Chris B. Apparatus and method for wrapping bundles of newspapers or the like, 5,009,055, Cl. 53-397.000

Simonsen, Christian *See*—
Levinson, Arthur, Simonsen, Christian, and Yelverton, Elizabeth M., 5,010,002, Cl. 435-69.200

Simplimatic Engineering Company *See*—
Hilbish, Brian K., Leonard, David W., Sr., Burgess, Arnold C. and Burns, David R., 5,009,550, Cl. 406-87.000
Roderick, Zackary A., and Rode, Leon A., 5,009,306, Cl. 198-414.000

Simpson, Scott *See*—
Gordon, Herman B., Owens, Mark J., Rubinstein, Leon, and Simpson, Scott, 5,009,607, Cl. 439-67.000

Sindeband, Seymour J., and Butler, Robert, to Science Accessories Corp. Method and apparatus for position determination, 5,009,237, Cl. 178-18.000

Singh, Baldev *See*—
Lesher, George Y., deceased, Bacon, Edward R., Singh, Baldev, and Kuo, Gee-Hong, 5,010,086, Cl. 514-303.000

Sinofsky, Edward I. *See*—
Daignault, Kenneth J., Jr., McNamara, Edward J., and Sinofsky, Edward L., 5,009,655, Cl. 606-007.000

Sintim-Damoa, Kwame *See*—
Minshall, Billy W., Purohit, Kailash, Nygard, John F., Sintim-Damoa, Kwame, Giesler, Richard, and Woodworth, Archie, 5,009,654, Cl. 604-410.000

SIP - Societa Italiana per l'Esercizio Delle Telecomunicazioni P.A. *See*—
Braglia, Marco, DeFranceschi, Roberto, and Montangero, Paolo, 5,010,253, Cl. 250-399.000

Sippel, Achim, Kruse, Heinz-Josef, and Becker, Wilfried, to Rheinmetall GmbH. High-explosive projectile, 5,009,167, Cl. 102-524.000

Sit, Hon P., Galbi, David, and Chan, Alfred K., to Intel Corporation. Prenormalization for a floating-point adder, 5,010,508, Cl. 364-748.000

Sit, Sing-Yuen, and Wright, John J., to Bristol-Myers Company. Anti-hypercholesterolemic tetrazol-1-yl intermediates, 5,010,205, Cl. 548-253.000

Sizmann, Rudolf *See*—
Schwetje, Norbert, Sizmann, Rudolf, and Khelifa, Noureddine, 5,009,071, Cl. 62-4.000

Skabrond, Klaus *See*—
Seidel, Willi, Ehniss, Roland, Skabrond, Klaus, Sauter, Ulrich, Maier, Ulrich, and Ebner, Roland, 5,009,128, Cl. 74-866.000

Skalak, Thomas C. *See*—
Feldman, Marc D., Skalak, Thomas C., and Belardinelli, Luiz, 5,009,634, Cl. 604-27.000

SKF GmbH *See*—
Broekmuller, Uwe, and Weber, Hans-Gerd, 5,009,525, Cl. 384-576.000
Dittenhoefer, Thomas, 5,009,524, Cl. 384-475.000

Skinner, Dale D. and Thompson, John H., to Westinghouse Electric Corp. Sonar test system and method, 5,010,525, Cl. 367-13.000

Skuballa, Werner, Dahl, Helmut, Vorbrueggen, Helmut, Loge, Olaf, and Thierauch, Karl-Heinz, to Schering Aktiengesellschaft. Cyclodextrin clathrates of 5-cyanoprostacyclin derivatives and their use as pharmaceutical agents, 5,010,065, Cl. 514-58.000

Skvarce, Dennis H. *See*—
Nolan, John H., and Skvarce, Dennis H., 5,009,140, Cl. 83-698.000

Slade, Louise *See*—
Levine, Harry, Slade, Louise, Van Lengerich, Bernhard, and Pickup, John G., 5,009,900, Cl. 426-96.000

Slagteriernes Forskningsinstitut *See*—
Joergensen, Tage W., and Christensen, Leif, 5,009,191, Cl. 119-20.000

Sleik Ice Limited *See*—
Rzechula, Michael J., 5,010,127, Cl. 524-379.000

Sliger, Kris M., Moeller, Randolph C., and Williamson, Scott E., to Baker Hughes Incorporated. Well production apparatus including pump means and thermal absorption means, 5,009,264, Cl. 166-106.000

Sloan-Kettering Institute for Cancer Research *See*—
Albino, Anthony, Lloyd, Kenneth, Ikeda, Hisami, and Old, Lloyd, 5,009,995, Cl. 435-7.240

Smaling, Oral M., to White Consolidated Industries, Inc. Method of manufacturing an outer vacuum cleaner bag for an upright cleaner, 5,009,633, Cl. 493-214.000

Smart, Charles F. *See*—
D'Aquila, Anthony, Smart, Charles F., and Varian, Raymond H., 5,009,354, Cl. 227-2.000

Smetak, Vincenc *See*—
Pajgrt, Jan, Smetak, Vincenc, Kalina, Jaroslav, Zemek, Michal, Pus, Milan, and Bucek, Pavel, 5,009,253, Cl. 139-116.200

Smith, Darrell W. *See*—
Hendrickson, Alfred A., and Smith, Darrell W., 5,009,842, Cl. 419-28.000

Smith, Franklin G., to Manufacturer's Consultants, Inc. Cord-type tire traction device, 5,009,256, Cl. 152-221.000

Smith-Horn, Garry R., and Wendt, Robert J., to General Motors Corporation. Vehicle door pivoted side glass, 5,009,461, Cl. 296-146.000

Smith, Jack E., to General Motors Corporation. Strap wrench end attachment assembly for a twisted rope torsion bar, 5,009,405, Cl. 267-273.000

Smith, James R. *See*—
Holtan, Ramer B., Jr., Falk, Kevin I., Bergman, James F., Smith, James R., and Nelson, Kenneth E., 5,009,496, Cl. 351-156.000

Smith, Lynn U., and Merlino, Mario J., to Smith, Lynn U. Easy to fasten trousers, 5,008,962, Cl. 2-234.000

Smith, Martin P., and Saunders, Colin D., to Spandrel Establishment. Method of classifying objects according to shape, 5,010,247, Cl. 250-223.00R

Smith, Peter R. *See*—
Baker, Derrick J., Bugden, Walter G., and Smith, Peter R., 5,009,357, Cl. 228-122.000

Smith, Raoul D., to Aeolian Partnership. Wind motor, 5,009,571, Cl. 416-79.000

Smith, Richard L. *See*—
Martin, Luther W. and Smith, Richard L., 5,009,007, Cl. 30-92.000

Smith, Robert A. *See*—

Stiefel, Joseph F., Melvin, Terence, and Nesbitt, R. Dennis, 5,009,427, Cl. 273-232.000

Spandrel Establishment *See*—
Smith, Martin P., and Saunders, Colin D., 5,010,247, Cl. 250-223.00R

Sparton Corporation *See*—
Merriam, David P., Scott, Dale E., and Scott, Bryan E., 5,010,568, Cl. 379-107.000

Speck, Ulrich, and Roumeliotis, Panayiotis, Guar flour, 5,010,061, Cl. 514-54.000

Spector, George *See*—
Huffaker, Almyria, and Spector, George, 5,009,382, Cl. 248-284.000

Spehar, Eli G., to Smith, Rodney B.; and Ostic, Ernest I. Portable body massage table, 5,009,170, Cl. 108-36.000

Speranza, George P., Lin, Jiang-Jen, and Cuscurida, Michael, to Texaco Inc. Process for preparing novel diamines, 5,010,160, Cl. 528-45.000

Spielberger, Richard K. *See*—
Dunaway, Thomas J., Spielberger, Richard K., Dicks, Lori A., and Loy, Jerald M., 5,010,387, Cl. 357-70.000.

Spies, Alfons, to Dr. Johannes Heidenhain GmbH. Photoelectric position-measuring arrangement having a plurality of shiftable grids, 5,009,506, Cl. 356-356.000

Spinos, Frank T., and Worley, Sharon M. Beverage cooler, 5,009,083, Cl. 62-400.000

Spitler, Wayne I., to General Motors Corporation. Clutch damper assembly, 5,009,301, Cl. 192-106.200

Spitz, Robert A., and Bricker, Mark, to East Penn Manufacturing Co., Inc. Process for the extended use of strip acid employed in the reclamation of battery acid fluid from expanded lead-acid batteries, 5,009,868, Cl. 423-139.000

Spraggs, Richard W. *See*—
Robins, Kendall H., Austin, Dennis K. and Spraggs, Richard W., 5,009,163, Cl. 102-301.000

Springer, Hartmut; and Reiher, Uwe, to Hoechst Aktiengesellschaft. Water-soluble azo compounds having a N-(phenethyl)-amido-carbonyl-methoxyphenyl radical, substituted by a fiber-reactive group of the vinylsulfone series, suitable as fiber-reactive dyestuffs, 5,010,180, Cl. 534-638.000

Sprintschnik, Gerhard, Niederstaetter, Walter, Reiss, Kurt, von Asten, Wolfgang, Scharf, Gunther, and Grzembra, Barbara, to Hoechst AG. and Vereinigte Aluminum Werke A.G. Process for producing base material for an aluminum offset printing plate, 5,009,722, Cl. 148-2.000

Square D Company *See*—
Bartee, Edward C., 5,010,211, Cl. 174-48.000
Brady, Peter J., 5,010,438, Cl. 361-56.000

SSMC Inc. *See*—
Sato, Shuichi, Koguchi, Yoshimi, and Kobayashi, Yoshiharu, 5,009,177, Cl. 112-292.000

Staar S.A. *See*—
d'Alayerde, Costemore d'Arc, Stephane M., 5,010,428, Cl. 360-99.060

Stafsudd, Oscar M. *See*—
Bunshah, Rointan F., Parsons, James D. and Stafsudd, Oscar M., 5,010,035, Cl. 437-100.000

Stahl, Steven B. *See*—
Klett, Paul A., Bakhshi, Shiv K. and Stahl, Steven B., 5,009,932, Cl. 427-243.000

Stahl, Ted, to Stahls' Inc. Pre-sewn letter and method, 5,009,943, Cl. 428-40.000

Stahls' Inc. *See*—
Stahl, Ted, 5,009,943, Cl. 428-40.000

Stankus, John C. to Jennmar Corporation. Expansion assembly for mine roof bolts, 5,009,549, Cl. 405-261.000

Stanley Electric Co., Ltd. *See*—
Ohmamyuda, Yukio, Tanabe, Toru, Matsumoto, Osamu, Suzuki, Hidenobu, and Jyouzuka, Masashi, 5,010,457, Cl. 362-66.000

Starr, George N. to Delaware Capital Formation, Inc. Vehicle lift, 5,009,287, Cl. 187-8.410

Stasch, Johannes-Peter *See*—
Henning, Rolf, Benz, Gunter, Stasch, Johannes-Peter, Knorr, Andreas, and Bender, Wolfgang, 5,010,057, Cl. 514-018.000

Staubli, Andrea *See*—
Ron, Eyal; Staubli, Andrea and Langer, Robert S., 5,010,167, Cl. 528-328.000

Staudenraus, Joachim *See*—
Eisenmenger, Wolfgang, and Staudenraus, Joachim, 5,010,248, Cl. 250-227.210.

Stavely, Donald J. *See*—
Wanger, Mark E., Methlie, Jennifer L., Christie, Leslie G., Dauner, Daniel R., Domel, Douglas R., Jones, David P., Oliver, Thomas C. and Stavely, Donald J., 5,010,536, Cl. 369-36.000

Steck, Werner, Marosi, Laszlo, Haberkorn, Herbert; Feser, Rainer, Huebner, Werner, and Jakusch, Helmut; to BASF Aktiengesellschaft. Stabilization of acicular ferromagnetic chromium dioxide, 5,009,827, Cl. 423-607.000

Steele, Douglas S., to General Electric Company. Ionization detector, 5,010,252, Cl. 250-385.100

Steele, John, Johansen, Oddvar, Johnson, Graham, and Hodgkin, Johnathon, to Commonwealth Scientific & Industrial Research Organisation & Telectronics Pty. Limited. Material for cell attachment and growth, 5,010,009, Cl. 435-240.243

Stehmeier, Heinz *See*—
Schmidt, Ernst, Stehmeier, Heinz, Ruppert, Heinrich W., Gatschmann, Klaus G. and Schutze, Gunter, 5,009,237, Cl. 131-70.000

Steiger, Ronald P. *See*—
Leung, Peter K., Steiger, Ronald P., and Kunze, Kenneth R., 5,010,301, Cl. 324-376.000

Steigerwald, Carl J. to Kendall Company, The. Valve assembly, 5,009,391, Cl. 251-149.100

Steigerwald, Robert L., to General Electric Company. Lossless gate driver circuit for a high frequency converter, 5,010,261, Cl. 307-571.000

Stein-Industrie *See*—
Bonnand, Christian, Mascart, Dominique, and Druelle, Philippe, 5,008,996, Cl. 29-727.000

Stein, Matthew L. to Haws Company. Emergency wash station, 5,008,963, Cl. 4-620.000

Steiner, Antoine *See*—
Siener, Pierre, and Steiner, Antoine, 5,010,578, Cl. 382-8.000

Steinke, Ulrich, to Ernst Jacobi & Co. KG. Cleaning device for textile machines disposed in a row, 5,008,972, Cl. 15-312.200

Stenemann, Bruno *See*—
Sacco, Bruno, Tomforde, Johann, Abb, Thomas, and Stenemann, Bruno, 5,009,042, Cl. 52-36.000

Stengel, Philip B., to Creative Binding Systems, Inc. Booklet binding system, 5,009,537, Cl. 402-21.000

Stenqvist, Jan N. Printing unit, 5,009,159, Cl. 101-351.000

Stensio, Karl-Erland M. *See*—
Helmer, Ulla K. E., and Stensio, Karl-Erland M., 5,009,789, Cl. 210-641.000

Stephens, Robert S. *See*—
Penny, Glenn S., Stephens, Robert S., and Winslow, Alan R., 5,009,797, Cl. 252-8.551

Sterk, Geert J., Timmerman, Henk, and van der Goot, Henk, to Cedona Pharmaceuticals B.V. N-(W-substituted alkyl)-imidazol-4-yl)alkyl) guanidine, 5,010,095, Cl. 514-400.000

Sterling Drug Inc. *See*—
Lesher, George Y., deceased, Bacon, Edward R., Singh, Baldev, and Kuo, Gee-Hong, 5,010,086, Cl. 514-303.000

Stewart, Kenneth W., Sr., to United Technologies Electro Systems, Inc. Windshield wiper arm, 5,008,971, Cl. 15-250.200

Stiefel, Joseph F., Melvin, Terence, and Nesbitt, R. Dennis, to Spalding & Evenflo Companies, Inc. Golf ball, 5,009,427, Cl. 273-232.000

Stimler, Jeffrey J. *See*—
Foster, Stephen I., Stimler, Jeffrey J. and Nonnemacher, Gail S., 5,009,953, Cl. 428-327.000.

Stingelin, Willy, to Ciba-Geigy Corporation. Cationic compounds, 5,010,190, Cl. 544-198.000

Stinson, Robert A. Scraping tool, 5,009,009, Cl. 30-172.000

Stoddard, Trenton D. *See*—
Nash, Bryan, and Stoddard, Trenton D., 5,010,565, Cl. 379-61.000.

Stokbroekx, Raymond A., Luyckx, Marcel G. M., and Janssens, Frans E., to Janssen Pharmaceutica N.V. Intermediates for the synthesis of benzoxazol- and benzothiazolamine derivatives, useful as anti-anoxic agents, 5,010,198, Cl. 546-114.000

Stokes, Barry O., Bradshaw, Gary D., and Barlow, Wayne K., to Wescor, Inc. Apparatus for applying a controlled amount of reagent to a microscope slide or the like, 5,009,185, Cl. 118-52.000

Stolpe, Lars O. *See*—
Mosele, John I., and Stolpe, Lars O., 5,010,336, Cl. 340-907.000

Stone & Webster Engineering Corporation *See*—
Goelzer, Alan R., 5,009,769, Cl. 208-113.000

Stonehocker, Van T., to Coltec Industries Inc. Computer-based engine diagnostic method, 5,010,487, Cl. 364-424.030

Storrow, Alan J., and Knighton, Nigel J., to Radstone Technology Limited. Rack mounted circuit board, 5,010,444, Cl. 361-386.000

Storz Medical AG *See—*
Hagelauer, Ulrich, 5,009,682, Cl. 55-159.000

Stover, Detlev, Buchkremer, Hans-Peter, and Hecker, Rudolf, to Forschungszentrum Julich GmbH Process for joining workpieces of metal or ceramic by boundary surface diffusion 5,009,359, Cl. 228-175.000

Strandberg, Hans G., to Siemens Aktiengesellschaft Oscillator having periodically pulsed crystal 5,010,307, Cl. 331-116.0FE

Streck, Donald A., and Iggulden, Jerry R., to Light Ideas Incorporated Constant pressure, variable-volume irrigation sprinklers 5,009,368, Cl. 239-70.000

Streeter, Willie L. Microcomputer controlled rotation game 5,009,419, Cl. 273-454.000

Strenger, Heinrich *See—*
Traubel, Harro, Strenger, Heinrich, Weber, Karl A., Muller, Hans Werner, Zapfel, Horst, and Hummel, Axel, 5,009,921, Cl. 427-31.000

Stringer, Brian F. *See—*
Auld, John W., Stringer, Brian F., and Stringer, Brian F., 5,009,305, Cl. 198-395.000
Auld, John W., Stringer, Brian F., and Stringer, Brian F., 5,009,305, Cl. 198-395.000

Stubbs, Jack B. *See—*
Murphy, Martin J., Jr., Stubbs, Jack B., and Leonard, Thomas A., 5,009,503, Cl. 356-339.000

Stufflebeam, John F. *See—*
McSweeney, Michael A., and Stufflebeam, John F., 5,009,345, Cl. 222-556.000

Stults, Robert A. *See—*
Makkuni, Ranjit, Zdybel, Frank, Jr., and Stults, Robert A., 5,010,500, Cl. 364-521.000

Sturm, Robert E. *See—*
Case, Marvin L., Sturm, Robert E., and Herigstad, David P., 5,009,563, Cl. 414-470.000

Stutzenberger, Heinz *See—*
Grob, Ferdinand, Kienzler, Dieter, Linder, Ernst, Potschin, Roger, and Stutzenberger, Heinz, 5,009,064, Cl. 60-276.000

Subbotin, Anatoly N. *See—*
Lipukhin, Jury V., Danilov, Leonid I., Ivoditov, Albert N., Garber, Eduard A., Subbotin, Anatoly N., Pavlov, Valentin P., Zhukov, Jury K., and Pimenov, Alexandr F., 5,009,037, Cl. 51-7.000

Sudo, Masamichi, and Okuda, Tamotsu, to Daikyo Gomu Seiko Ltd Sliding stopper for a syringe 5,009,646, Cl. 604-230.000

Suen, Chih-Her *See—*
Liang, Rong-Chang, Colyer, Emerson K., Chen, Jing-Den, Kintz, Karl A., and Suen, Chih-Her, 5,010,114, Cl. 521-109.100

Suetomi, Joji *See—*
Nishitani, Masami, and Suetomi, Joji, 5,009,694, Cl. 65-115.000

Suganuma, Ryoichi, to Nikon Corporation Driving device for ultrasonic wave motor 5,010,222, Cl. 318-116.000

Sugata, Hiroyuki *See—*
Mihara, Chieko, Santoh, Tsuyoshi, Sugata, Hiroyuki, and Fukui, Tetsuro, 5,009,987, Cl. 430-495.000

Sugihara, Masanori *See—*
Kobayashi, Kazuo, Morikawa, Kiyoshi, Yamada, Yoshinori, Kurumada, Masakazu, and Sugihara, Masanori, 5,010,484, Cl. 369-77.200

Sugimoto, Atsushi, Nakano, Osamu, Yasuda, Shigeru, Maeda, Chikatoshi, Ozone, Toshio, and Kawagoe, Makoto, to Aichi Steel Works, Ltd., Toyota Jidosha Kabushiki Kaisha, and Chuo Hatsujo Kabushiki Kaisha Spring steel having good durability and sag-resistance 5,009,843, Cl. 420-112.000

Sugiue, Shigeki *See—*
Koga, Shigeyuki, and Sugiue, Shigeki, 5,009,172, Cl. 110-242.000

Sugiura, Koji, to Sakura Color Products Corporation Solid adhesive composition 5,010,120, Cl. 523-219.000

Sugiura, Shozou *See—*
Yoshikawa, Toshiharu, and Sugiura, Shozou, 5,009,731, Cl. 156-154.000

Sugiyama, Isao *See—*
Yamauchi, Hiroshi, Sugiyama, Isao, Saito, Isao, Nomoto, Seiichiro, Kamiya, Takashi, Machida, Yoshimasa, and Negi, Shigeto, 5,010,188, Cl. 540-222.000

Sugiyama, Masashi *See—*
Sakuta, Masaharu, Urano, Toshiharu, Tanaka, Kyoichi, Sugiyama, Masashi, Endoh, Shyuzo, and Fujioka, Keisuke, 5,009,713, Cl. 106-727.000

Suhonen, Christopher H., to Gillette Canada Inc. Aqueous stannous fluoride non-abrasive home treatment gel compositions 5,009,883, Cl. 424-52.000

Suhonen, Christopher H., to Gillette Canada Inc. Stabilized aqueous stannous fluoride mouthwash 5,009,884, Cl. 424-52.000

Sullivan Engine Works, Inc. *See—*
Sullivan, Robert W., Holder, Tommie J., and Buchanan, Max F., 5,009,198, Cl. 123-43.00A

Sullivan, Robert W., Holder, Tommie J., and Buchanan, Max F., to Sullivan Engine Works, Inc. Rotary vee engine 5,009,198, Cl. 123-43.00A

Sumi, Chiaki, and Kuwayama, Wataru, to Aisin Seiki K.K. Resin coated electric circuit board device 5,010,212, Cl. 174-52.200

Sumioka, Atsushi *See—*
Hikita, Mitsutaka, Sumioka, Atsushi, Tabuchi, Toyoji, Kurosawa, Kazuhito, and Kinoshita, Tuneo, 5,010,269, Cl. 310-313.00B

Sumitomo Chemical Co., Ltd *See—*
Ohmae, Tadayuki, Sakurai, Tadashi, and Asao, Kouichiro, 5,009,951, Cl. 428-294.000

Ohmae, Tadayuki, Toyoshima, Yoshiki, Mashita, Kentaro, Yamaguchi, Noboru, and Nambu, Jinsho, 5,010,136, Cl. 525-66.000

Sumitomo Electric Industries Ltd *See—*
Matsushita, Nobutaka, Okazaki, Hiroshi, Yamanouchi, Shosuke, Osawa, Yoshitaka, and Tsujigaito, Isao, 5,009,959, Cl. 428-419.000
Sasame, Akira, Sakanoue, Hitoyuki, Takeuchi, Hisao, Miyake, Masaya, Yamakawa, Akira, Yushio, Yasuhisa, and Akazawa, Hitoshi, 5,010,388, Cl. 357-70.000
Shiga, Nobuo, 5,010,305, Cl. 330-277.000

Sun, Shin Ching, Purifying air conditioner 5,009,683, Cl. 55-131.000

Sunbeam Plastics Corporation *See—*
Montgomery, Gary V., and Beck, Terry E., 5,009,323, Cl. 215-252.000

Sundstrand Corporation *See—*
Shekleton, Jack R., and Smith, Robert W., 5,009,589, Cl. 431-183.000

Sung Ho Korea Company *See—*
Kang, Sung H., 5,010,278, Cl. 315-224.000

Supchak, Dennis W. *See—*
Lombardino, Paul A., Saxon, Ronald L., and Supchak, Dennis W., 5,009,561, Cl. 414-412.000

Superior Fireplace Company *See—*
Brazell, David O., and French, J. Timothy, 5,009,221, Cl. 126-538.000

Surguy, Paul W. H. *See—*
Morris, Christopher J., Coulson, Ian, and Surguy, Paul W. H., 5,010,328, Cl. 340-784.000

Sussenguth, Jurgen *See—*
Focke, Heinz, and Sussenguth, Jurgen, 5,009,322, Cl. 209-536.000

Sutorik, John P. *See—*
Iseler, Stanley J., Beauch, Howard D., Everett, Benjamin H., II, and Sutorik, John P., 5,009,120, Cl. 74-493.000

Suwabe, Shigekazu *See—*
Shinohara, Tadashi, Nishiyama, Toshikazu, Noguchi, Kazumi, Iwata, Hitoshi, and Suwabe, Shigekazu, 5,010,431, Cl. 360-103.000

Suzuki, Fumio, Kuroda, Takeshi, Nakasato, Yoshisuke, Ohmori, Kenji, and Manabe, Haruhiko, to Kyowa Hakko Kogyo Co., Ltd Imidazoquinolone derivatives 5,010,084, Cl. 514-293.000

Suzuki, Hidenobu *See—*
Ohmamyuda, Yukio, Tanabe, Toru, Matsumoto, Osamu, Suzuki, Hidenobu, and Jyouzuka, Masashi, 5,010,457, Cl. 362-66.000

Suzuki, Hideo *See—*
Kosugi, Yoshitsugu, Tanaka, Hideoki, Suzuki, Hideo, and Shiraki, Masaru, 5,010,004, Cl. 435-134.000

Suzuki, Hitoshi, Shiotani, Shinobu, Tokunaga, Shinji, Hirai, Tokuyuki, Fukumochi, Yoji, Kugimiya, Shuzo, and Sata, Ichiko, to Sharp Kabushiki Kaisha System and method for language translation including replacement of a selected word for future translation 5,010,486, Cl. 364-419.000

Suzuki Jidosha Kogyo Kabushiki Kaisha *See—*
Yuunaga, Toshifumi, 5,009,686, Cl. 55-419.000

Suzuki, Kenichi *See—*
Enari, Masahiko, Shikichi, Satoshi, Kawaguchi, Fumiaki, Suzuki, Kenichi, Usui, Masayuki, Matsuoka, Hiroshi, Matsuoka, Kazuhiko, Hosoya, Hideki, Aoki, Akio, and Minoura, Kazuo, 5,010,534, Cl. 369-32.000

Suzuki, Koichi *See—*
Harano, Takeshi, Takaki, Satoru, Shigesato, Yuzo, Suzuki, Koichi, Hashimoto, Naoki, Kojima, Hiroyasu, and Oyama, Takuji, 5,009,922, Cl. 427-37.000

Suzuki, Makoto, to Brother Kogyo Kabushiki Kaisha Image forming apparatus having switchable color separation filter units 5,010,415, Cl. 358-302.000

Suzuki, Tatsuya *See—*
Kato, Rentaro, and Suzuki, Tatsuya, 5,009,403, Cl. 267-140.100

Suzumura, Hirokazu *See—*
Kuki, Nobuyuki, Isomura, Yukio, Suzumura, Hirokazu, Sakakibara, Yoshikazu, and Ishihara, Hiroshi, 5,009,035, Cl. 49-352.000

Svenska Rotor Maskiner AB *See—*
Carlsson, Anders, Johansson, Lars, and Soderlund, Frits, 5,009,583, Cl. 418-104.000

Svenska Skatebox AB *See—*
Lager, Kjell, Tarnstrom, Anders, Ostlund, Olov, and Driver, Joseph W., 5,009,039, Cl. 51-165.770

Swanick, David J *See—*
Huntley, William P., and Swanick, David J., 5,010,341, Cl. 342-20.000

Swann, Peter R., to Gatan Incorporated. Chemically-assisted ion beam milling system for the preparation of transmission electron microscope specimens. 5,009,743, Cl. 156-643.000

Swartz, Roy, to Delaware Investments Corp Material handling system and control valve therefor 5,009,551, Cl. 406-128.000

Sweat, Bruce P *See—*
Lathom, Michael S., Gullixson, Bruce B., and Sweat, Bruce P., 5,010,279, Cl. 315-227.00R

Sweeney, Harold E *See—*
Leonard, Donald A., and Sweeney, Harold E., 5,009,500, Cl. 356-43.000

Sy-Quest International Limited *See—*
Newman, Jack, and Monroe, James A., 5,009,637, Cl. 604-68.000

Sylvester, Richard J *See—*
Beattie, Patrick J., Oliveri, Andrew L., and Sylvester, Richard J., 5,009,090, Cl. 70-326.000

Synfina-Oleofina *See—*
Prieels, Jean-Paul, Maschelein, Charles, and Heilporn, Marc, 5,010,007, Cl. 435-190.000.

Syntex Pharmaceuticals Ltd *See—*
Pascal, Jean C.; Lee, Chi-Ho, Alps, Brian J.; Pinhas, Henri, and Whiting, Roger L., 5,010,075, Cl. 514-218.000

Synthelabo *See—*
Manoury, Philippe; Binet, Jean, Obitz, Daniel, Defosse, Gerard, Dewitte, Elisabeth, and Veronique, Corinne, 5,010,079, Cl. 514-253.000

Syntro Corporation: *See—*
Pollock, Thomas J., 5,010,001, Cl. 435-69.100

Syrinek, Allen R., Buggs, Ralph N., and Gabel, Robert K., to Nalco Chemical Company. Inorganic acid solution viscosifier and corrosion inhibitor and method. 5,009,799, Cl. 252-8.553

Tabuchi, Toyoji *See—*
Hikita, Mitsutaka; Sumioka, Atsushi; Tabuchi, Toyoji, Kurosawa, Kazuhito, and Kinoshita, Tuneo, 5,010,269, Cl. 310-313.00B

Tagashira, Susumu *See—*
Maruyama, Hiroshi; Kiryu, Naohiko, Minezaki, Etsuko; Tagashira, Susumu, and Shimokawahara, Hisashi, 5,009,944, Cl. 428-40.000

Tagawa, Koichi, to Maeda Industries, Ltd Shift lever assembly for bicycle 5,009,629, Cl. 474-80.000

Taguchi, Akira, Morita, Shigetoshi, Taka, Shunichi, Yamada, Hirohide, Takada, Yoshiaki, Furuichi, Shinji, and Ao, Masahiro, to Hitachi Metals, Ltd Floating magnetic head having improved static friction coefficient. 5,010,429, Cl. 360-103.000

Taguchi, Katsuhiko, and Mitsumori, Kazuya, to Juki Corporation Apparatus for positioning a magnetic disk on a disk drive 5,010,427, Cl. 360-99.050

Taiyo Ink Manufacturing Co., Ltd *See—*
Kamayachi, Yuichi, and Inagaki, Syoji, 5,009,982, Cl. 430-280.000

Taiyo Yuden Co., Ltd *See—*
Arai, Yuji; Shin, Yuaki, Ishiguro, Takashi, and Hamada, Emiko, 5,009,818, Cl. 264-1.003
Hayashi, Yutaka, Itoh, Atuo, Imai, Mizuho, and Iida, Hideyo, 5,009,928, Cl. 427-126.300

Taka, Shunichi: *See—*
Taguchi, Akira; Morita, Shigetoshi, Taka, Shunichi, Yamada, Hirohide, Takada, Yoshiaki, Furuichi, Shinji, and Ao, Masahiro, 5,010,429, Cl. 360-103.000.

Takada, Hirohisa, to Fuji Jukogyo Kabushiki Kaisha Anti-frost system for a windshield of a motor vehicle 5,010,289, Cl. 322-8.000

Takada, Yoshiaki *See—*
Taguchi, Akira, Morita, Shigetoshi, Taka, Shunichi, Yamada, Hirohide, Takada, Yoshiaki, Furuichi, Shinji, and Ao, Masahiro, 5,010,429, Cl. 360-103.000

Takada, Yoshinao: *See—*
Yamada, Takehito, Tanimoto, Kazushi, Sakai, Yuji, Muraoka, Takao, Inoue, Tetsuo, and Takada, Yoshinao, 5,010,430, Cl. 360-103.000.

Takahashi, Koji: *See—*
Yasumura, Hiroto, Hirasawa, Masahide, Noji, Minoru, Kozuki, Susumu, Takahashi, Koji, and Yoshimura, Katsuji, 5,010,416, Cl. 358-314.000

Takahashi, Nobuyuki, to Akebono Brake Industry Co., Ltd., and Akebono Research and Development Centre Ltd Disc brake apparatus 5,009,293, Cl. 188-72.400

Takahashi, Osamu: *See—*
Aoki, Kozo; and Takahashi, Osamu, 5,009,989, Cl. 430-512.000

Takahashi, Toshio: *See—*
Kanehira, Makoto, Nakagawa, Takerou, Tsubakimoto, Yasumasa, Tanaka, Kouji, Takahashi, Toshio, and Ikeda, Masaaki, 5,009,630, Cl. 474-211.000.

Takahiro, Syuji: *See—*
Yoshida, Keiji; Funato, Ryo, Takahiro, Syuji, Kubo, Shinji, and Inagaki, Notoshi, 5,009,978, Cl. 430-109.000

Takajo, Toshimi; Asai, Hiromitsu, and Haginuma, Kiyoshi, to Nippon Seiko Kabushiki Kaisha. Dynamic pressure type bearing and spindle unit. 5,009,520, Cl. 384-100.000

Takaki, Satoru *See—*
Harano, Takeshi, Takaki, Satoru, Shigesato, Yuzo, Suzuki, Koichi, Hashimoto, Naoki; Kojima, Hiroyasu, and Oyama, Takuji, 5,009,922, Cl. 427-37.000

Takaki, Satoshi: *See—*
Echizen, Hiroshi, and Takaki, Satoshi, 5,010,276, Cl. 315-111.210

Takakura, Shinichi *See—*
Mandai, Harufumi, Tanaka, Yukio; Takakura, Shinichi, and Nakagawa, Takuji, 5,009,744, Cl. 156-656.000.

Takamatsu, Osamu: *See—*
Eguchi, Ken, Kawada, Haruki, Sakai, Kunihiro, Tomida, Yoshinori; Matsuda, Hiroshi, Tsuboyama, Akira, Takimoto, Kiyoshi, and Takamatsu, Osamu, 5,009,489, Cl. 350-341.000

Takano, Haruhiro, to Yokohama Rubber Co., Ltd., The Rubber compositions for tire inner liners. 5,010,142, Cl. 525-332.400.

Takashima, Masaaki: *See—*
Umeda, Itsuki, Takashima, Masaaki; Zama, Yoshiaki, Takemura, Yasuhiko, Funabashi, Yuichi, Watanabe, Junichiro, Takeda, Kiyoshi; and Matsumoto, Makoto, 5,010,137, Cl. 525-104.000

Takayama, Naoto, to Fuji Photo Film Co., Ltd. Apparatus for incorporating lock plates in video cassettes 5,010,436, Cl. 360-137.000.

Takayama, Tsutomu *See—*
Kinoshita, Takao; Tojo, Akihiko, Takayama, Tsutomu; Kaji, Toshio; and Tanaka, Nobuyoshi, 5,010,418, Cl. 358-335.000

Takeda, Kiyoshi *See—*
Umeda, Itsuki, Takashima, Masaaki, Zama, Yoshiaki, Takemura, Yasuhiko, Funabashi, Yuichi, Watanabe, Junichiro, Takeda, Kiyoshi, and Matsumoto, Makoto, 5,010,137, Cl. 525-104.000

Takeda, Takayuki, and Satoh, Masayasu, to Oki Electric Industry Co., Ltd Focus servo apparatus 5,010,538, Cl. 369-44.360

Takegami, Kiyoyoshi *See—*
Endo, Mineyo, Takegami, Kiyoyoshi, Hishida, Noriaki, and Miyaji, Itsuo, 5,009,436, Cl. 277-80.000

Takeguchi, Shunsuke *See—*
Hiraoka, Takeshi, Takeguchi, Shunsuke, and Kawai, Satoshi, 5,009,123, Cl. 74-567.000

Taket, Katsumori, Fukushima, Hitoshi, Iwamoto, Kohei, and Nakamura, Hiroto, to Seiko Epson Corporation Thermal transfer ink printing apparatus 5,010,352, Cl. 346-76.0PH.

Takemura, Yasuhiko *See—*
Umeda, Itsuki, Takashima, Masaaki, Zama, Yoshiaki, Takemura, Yasuhiko, Funabashi, Yuichi, Watanabe, Junichiro, Takeda, Kiyoshi, and Matsumoto, Makoto, 5,010,137, Cl. 525-104.000

Takenaka, Kohei *See—*
Shiokawa, Youichi, Takimoto, Koichi, and Takenaka, Kohei, 5,010,093, Cl. 514-374.000

Takenaka Komuten Company, Ltd *See—*
Sakuta, Masaharu, Urano, Toshiharu, Tanaka, Kyoichi, Sugiyama, Masashi, Endoh, Shyuzo, and Fujioka, Keisuke, 5,009,713, Cl. 106-727.000

Takesue, Toshihiro *See—*
Murahashi, Takashi, Nakazawa, Toshihiko, Takesue, Toshihiro, and Motoi, Toshihiro, 5,010,353, Cl. 346-108.000

Takeuchi, Hisao *See—*
Sasame, Akira, Sakanoue, Hitoyuki, Takeuchi, Hisao, Miyake, Masaya, Yamakawa, Akira, Yushio, Yasuhisa, and Akazawa, Hitoshi, 5,010,388, Cl. 357-70.000

Takeuchi, Kenji, Gagnon, Andre F., Cheung, Augustine C., and Meyer, Philip E., to Westinghouse Electric Corp. Expert system for surveillance, diagnosis and prognosis of plant operation 5,009,833, Cl. 376-217.000

Takeuchi, Kikuko *See—*
Nakamura, Tomio, Shimizu, Shigeru, and Takeuchi, Kikuko, 5,009,811, Cl. 252-500.000.

Takeuchi, Masahiko *See—*
Sato, Kazuhiro, Kishi, Tomomi, Umeda, Koji, Uchida, Yasushi, and Takeuchi, Masahiko, 5,010,226, Cl. 219-81.000

Takeuchi, Ryoji, to Kabushiki Kaisha Toshiba Apparatus having a movable portion and a fixed portion for reproducing data from an optical disk by a light beam 5,010,541, Cl. 369-107.000.

Takeuchi, Tatsuo, and Amemiya, Koji, to Canon Kabushiki Kaisha Transparent film and color image forming method 5,009,945, Cl. 428-76.000

Takeuchi, Yoshiaki: *See—*
Sasaki, Hiroyuki, Shimamura, Masato, Noda, Juichi, Hanafusa, Hiroaki, and Takeuchi, Yoshiaki, 5,009,478, Cl. 350-96.150

Takimoto, Kiyoshi *See—*
Eguchi, Ken, Kawada, Haruki, Sakai, Kunihiro, Tomida, Yoshinori, Matsuda, Hiroshi, Tsuboyama, Akira, Takimoto, Kiyoshi, and Takamatsu, Osamu, 5,009,489, Cl. 350-341.000

Takimoto, Koichi *See—*
Shiokawa, Youichi, Takimoto, Koichi, and Takenaka, Kohei, 5,010,093, Cl. 514-374.000

Takushima, Akiro *See—*
Tanaka, Syozo, Takushima, Akiro, Shinobu, Yoshiharu, and Eguchi, Masaki, 5,009,084, Cl. 62-441.000

Talcott, James G. Wear resistant grain flow control elbow 5,009,552, Cl. 406-193.000.

Tamagnone, Gianfranco *See—*
Piani, Silvano, Tamagnone, Gianfranco, Alpino, Raul R., Milani, Maria R., and Fantuz, Marinella, 5,010,063, Cl. 514-56.000

Tamahoko, Tetsuya *See—*
Ohkawa, Osamu, Tamahoko, Tetsuya, and Imanage, Eisuke, 5,009,296, Cl. 192-20.000

Tamari, Koussaku, and Katamoto, Tsutomu, to Toda Kogyo Corp Non-magnetic pigments 5,009,712, Cl. 106-456.000

Tamori, Hirofumi *See—*
Yoshida, Kimiyoshi, Sakano, Akio, Tamori, Hirofumi, and Chatani, Masayuki, 5,010,579, Cl. 382-13.000

Tanaami, Toshiyasu *See—*
Kamishouri, Nobuyuki, Kaneda, Manabu, Tanaami, Toshiyasu, and Maeda, Miho, 5,009,651, Cl. 604-378.000

Tanabe, Hideo *See—*
Kitada, Masahiro, Shimizu, Noboru, Tanabe, Hideo, and Nakamura, Hitoshi, 5,010,433, Cl. 360-113.000

Tanabe, Toru *See—*

Urich, Oren D., and Meyer, Vernie G., to Colorado National Manufacturers, Inc. Baling apparatus, 5,009,062, Cl. 56-341.000

Usami, Kimiyoshi, and Ishii, Aya, to Kabushiki Kaisha Toshiba. Programable logic array using one control clock signal, 5,010,258, Cl. 307-469.000

Ushizima, Kunio. *See*—
Kadono, Osamu, and Ushizima, Kunio, 5,010,238, Cl. 235-379.000

Usleman, Robert T. *See*—
Howe, Michael G., Arthur, James C., and Usleman, Robert T., 5,009,065, Cl. 60-288.000

Usui Kokusai Sangyo Kaisha Ltd. *See*—
Usui, Masayoshi, 5,009,376, Cl. 248-74.100

Usui, Masayoshi, to Usui Kokusai Sangyo Kaisha Ltd. Seizure-fixing device of pipe by clamp member, 5,009,376, Cl. 248-74.100

Usui, Masayuki. *See*—
Enari, Masahiko; Shikichi, Satoshi, Kawaguchi, Fumiaki; Suzuki, Kenichi, Usui, Masayuki, Matsuoka, Hiroshi, Matsuoka, Kazuhiko, Hosoya, Hideki, Aoki, Akio, and Minoura, Kazuo, 5,010,534, Cl. 369-32.000

Utkin, Vladimir F. *See*—
Paton, Boris E., Utkin, Vladimir F., Nedoseka, Anatoly Y., Khromyak, Nikolai T., Gorlitsyn, Nikolai V., Tikhy, Viktor G., Mezintsev, Evgeny D., and Mezhuev, Nikolai N., 5,010,503, Cl. 364-569.000

Utsugi, Nobuo, Kihara, Hisashi, Mori, Shuichi, Fuse, Junichi; Miyake, Takashi, and Ikata, Yoshikatsu, to Pioneer Electronic Corp. Recording medium player apparatus, 5,010,437, Cl. 360-137.000

Utsunomiya, Tomoaki. *See*—
Nishizawa, Hidekazu, and Utsunomiya, Tomoaki, 5,010,299, Cl. 324-209.000

Vaisala Oy. *See*—
Andersson, Henry, 5,010,343, Cl. 342-432.000

Valenza, Joseph P. *See*—
Ahmad, Jameel, and Valenza, Joseph P., 5,009,543, Cl. 404-70.000

Vallowe, Robert M. *See*—
Kerr, E. Michael, Connelly, Lawrence J., Roe, William J., and Vallowe, Robert M., 5,009,873, Cl. 423-320.000

Valmet Oy. *See*—
LePisto, Matti, Ilmanen, Reijo, Karlsson, Markku, and Laakso, Sauli, 5,009,016, Cl. 34-41.000

Vanaschen, Luc. *See*—
Kuster, Hans-Werner, and Vanaschen, Luc, 5,009,695, Cl. 65-182.200

van Banning, Robert J. H. M. *See*—
Knop, Albert W., and van Banning, Robert J. H. M., 5,009,031, Cl. 47-64.000

van Basshuysen, Richard; and Bauder, Armin, to Audi AG. Intake manifold assembly for a multicylinder internal combustion engine, 5,009,200, Cl. 123-52.00M

van Broekhoven, Johannes A. M., and Miedema, Wiebren A., to Shell Oil Company. Carbon monoxide/olefin polymerization with catalyst comprising p. bidentate ligand having non-hydrocarbyl substituent, 5,010,171, Cl. 528-392.000

van de Merwe, Ronald H. *See*—
Rue, Charles V.; van de Merwe, Ronald H., Bauer, Ralph, Pellow, Scott W., Cottringer, Thomas E., and Klok, Richard J., 5,009,676, Cl. 51-309.000

Van Den Berg, Johan A. *See*—
Brake, Anthony J., and Van Den Berg, Johan A., 5,010,182, Cl. 536-27.000

Vanderbilt University. *See*—
Hellergvist, Carl G., 5,010,062, Cl. 514-54.000

van der Goot, Henk. *See*—
Sterk, Geert J., Timmerman, Henk, and van der Goot, Henk, 5,010,095, Cl. 514-400.000

Vanderpool, Clarence D. *See*—
Kim, Tai K., and Vanderpool, Clarence D., 5,009,788, Cl. 210-639.000

van der Wilk, Ronald, to U S. Philips Corporation. Electron tube device and electron tube, 5,010,275, Cl. 315-106.000

Vandoni, Guido. *See*—
Fregnan, Giancarlo; Vandoni, Guido, and Torri, Giangiacomo, 5,010,064, Cl. 514-58.000

van Druff, Albert, Jr.; and Fussell, David A., to Cornerstone Products Inc. Mailbox insert, 5,009,366, Cl. 232-17.000

Vanek, Dieter. *See*—
Lamatsch, Hans; and Vanek, Dieter, 5,010,229, Cl. 219-121.210

VanGorder, David H., and Wilson, Kenny R., to General Motors Corporation. Automotive power steering system, 5,009,066, Cl. 60-415.000

Vangsgard, Kip S., to Turfco Manufacturing, Incorporated. Earth-working machine with single handle for adjusting and locking blade depth, 5,009,270, Cl. 172-42.000

Van Heertum, John C., Gerwick, Ben C., III, and Kleschick, William A., to Dow Chemical Company, The. Herbicidal alkoxy-1,2,4-triazolo(1,5-c)pyrimidine-2-sulfonamides, 5,010,195, Cl. 544-263.000

Van Leeuwen, Petrus W. N. M., and Roobeek, Cornelis F., to Shell Oil Company. Polymerization of carbon monoxide/olefin with tertiary monophosphine or secondary monophosphine oxide, 5,010,172, Cl. 528-392.000

Van Lengerich, Bernhard. *See*—
Levine, Harry, Slade, Louise; Van Lengerich, Bernhard, and Pickup, John G., 5,009,900, Cl. 426-96.000

van Merksteijn, Jacobus L., to Machinefabriek Wila B.V. Press and curve-forming means therefor, 5,009,098, Cl. 72-389.000.

van Perlstein, Erik B. *See*—
den Hartog, Huibert; and van Perlstein, Erik B., 5,009,396, Cl. 266-115.000

Van Syckle, Peter B.; and Kashuba, Glen A. Plug and method of use, 5,009,666, Cl. 623-23.000

van Wijngaarden, Ineke. *See*—
Waldeck, Harald, Benson, Werner, Zeugner, Horst, Wolf, Klaus-Ulrich, Gregory, Peter-Colin, Hamminga, Derk, and van Wijngaarden, Ineke, 5,010,076, Cl. 514-221.000

Vargo, Francis R. *See*—
Fenger, Michael L., and Vargo, Francis R., 5,009,856, Cl. 422-178.000.

Vari-Lite, Inc. *See*—
Taylor, Brooks W.; and Walsh, Thomas E., 5,010,459, Cl. 362-85.000.

Varian Associates, Inc. *See*—
Wells, Gregory J., and Bolton, Barbara A., 5,009,099, Cl. 73-1.00G

Varian, Raymond H. *See*—
D'Aquila, Anthony, Smart, Charles F.; and Varian, Raymond H., 5,009,354, Cl. 227-2.000

Vassiliades, Anthony E. Finger-printing systems & method, 5,009,919, Cl. 427-1.000

Vaylen, Nicholas E. *See*—
Cullen, John S.; Incorvia, Samuel A.; Nigon, Christopher S., and Vaylen, Nicholas E., 5,009,308, Cl. 206-204.000

Vayman, Zinovy Y., to Mobil Solar Energy Corporation. Method of fabricating solar cells, 5,010,040, Cl. 437-230.000

Venaleck, John T. *See*—
Black, Robert H., and Venaleck, John T., 5,009,618, Cl. 439-736.000

Venn, Peter. *See*—
Bartkowski, Klaus-Dieter, and Venn, Peter, 5,009,756, Cl. 204-129.350

Vereinigte Aluminum Werke A G *See*—
Sprintschnik, Gerhard, Niederstaetter, Walter, Reiss, Kurt von Asten, Wolfgang Scharf, Gunther and Grzembra, Barbara, 5,009,722, Cl 148-2.000

Vermersch, Alain, to Thomson-CSF Agile magnetron with tuning motor with improved cooling 5,010,273, Cl 315-39.610

Veronique, Corinne *See*—
Manoury, Philippe Binet Jean, Obitz, Daniel, Defosse, Gerard Dewitte, Elisabeth, and Veronique, Corinne, 5,010,079, Cl 514-253.000

Vezzani, Luciano *See*—
Ruffo, Giorgio and Vezzani, Luciano, 5,009,672, Cl 44-593.000

Vezzani S p A *See*—
Ruffo, Giorgio and Vezzani, Luciano, 5,009,672, Cl 44-593.000

Viazmensky, Helen, Richard, Carl E., and Williamson, James F., to Dexter Corporation, The Water entanglement process and product 5,009,747, Cl 162-115.000

Vickers, Incorporated *See*—
Bonnell, Raymond J., 5,009,067, Cl 60-484.000

Video Technology Industries, Inc *See*—
Fong, Chi-Ming, Chew, Wai-Kwok, and Law, Garry C., 5,009,603 Cl 434-323.000

Viens, Jacques, Twin axle rail bogie for convertible rail-highway vehicles 5,009,169, Cl 105-4.100

Villa-Garcia, Maria A., and Schwank, Johannes, to University of Michigan, The Regents of the Modified molybdenum sulfide hydrodesulfurization/hydrodenitrogenation catalysts 5,010,049, Cl 502-60.000

Villanyi, Tibor J., and Westerson, Kevin W., to Cummins Engine Company, Inc Unitary sealing system with internal venting 5,009,435, Cl 277-23.000

Villeneuve, Marc G., and Buckley, William P., to Burndy Corporation Separable electrical connector 5,009,606, Cl 439-59.000

Vincent, Kent D., and Jamp, Ruelming, to Hewlett-Packard Company, Method and apparatus for extracting information from forms 5,010,580, Cl 382-17.000

Vinck, Paul W *See*—
Nys, Pierre H., Vinck, Paul W., and von Erdmannsdorff Andreas, 5,010,398, Cl 358-80.000

Naganuma, Hiroshi, Sato, Kenji, Yamamoto, Masashi, Kubota, Toshiaki, Hayashi, Hiroshige, and Ishizaka, Yoshirou, 5,009,080, Cl 62-256.000
Yamamoto, Nobuyuki. *See*—
Koyama, Akihiro, Kitamura, Keiji, and Yamamoto, Nobuyuki, 5,010,041, Cl 501-4.000
Yamamoto, Takemi, Nagata, Osamu, Komiya, Ryohei, Sakai, Jun, and Ban, Yoshiyuki, to Brother Kogyo Kabushiki Kaisha. Image forming apparatus 5,010,360, Cl 355-20.000
Yamanaka, Masahiko, Hanaoka, Motoyoshi, Konse, Hiroaki, Shigeno, Haruhisa, and Kinoshita, Masakatsu, to Nissan Motor Co., Ltd. and Nippon Paint Co. Ltd. Method for forming tranparent multilayers 5,009,936, Cl 427-407.100
Yamane, Takakazu, Tanimoto, Yoshio, and Nakahama, Tadamitsu, to Mazda Motor Corporation. Coating method 5,009,931, Cl 427-195.000
Yamanouchi, Shosuke. *See*—
Matsushita, Nobutaka, Okazaki, Hiroshi, Yamanouchi, Shosuke, Osawa, Yoshitaka, and Tsujigatto, Isao, 5,009,959, Cl 428-419.000
Yamashita, Akio, Yoshimura, Susumu, and Tsuchiya, Sohji, to Matsushita Electric Industrial Co., Ltd. Functional devices comprising a charge transfer complex layer 5,009,958, Cl 428-411.100
Yamashita, Yoshisato. *See*—
Fujita, Toshio, Yamashita, Yoshisato, Yoshida, Shigemitsu, and Yamahira, Katsutoshi, 5,009,696, Cl 71-64.070
Yamasoe, Katsuyoshi, to Nippon Paint Co., Ltd. Surface treatment chemical and bath for forming hydrophilic coatings and method of surface-treating aluminum members 5,009,962, Cl 428-470.000
Yamauchi, Hiroshi, Sugiyama, Isao, Saito, Isao, Nomoto, Seiichiro, Kamiya, Takashi, Machida, Yoshimasa, and Negi, Shigeto, to Eisai Co., Ltd. Cephem derivatives 5,010,188, Cl 540-222.000
Yamauchi, Hiroyuki, to Matsushita Electric Industrial Co., Ltd. Sensing circuit for a dynamic random access memory 5,010,523, Cl 365-205.000
Yamazaki, Atsuo. Rotary switch 5,010,214, Cl 200-6.00B
Yamazaki, Eizo. *See*—
Murakami, Tokumichi, Asai, Kohtaro, Kamizawa, Koh, Nishida, Masami, Yamazaki, Eizo, Itoh, Atsushi, and Kinjoh, Naoto, 5,010,401, Cl 358-136.000
Yamazaki, Katsunori, and Nagato, Mitsuo, to Seiko Epson Corporation. Circuit for driving a liquid crystal display device 5,010,326, Cl 340-784.000
Yanagita, Tomoatsu. *See*—
Matsumoto, Kenji, Yanagita, Tomoatsu, Nishiyama, Yoshinori, Nagai, Masahiko, and Morikuni, Mitsuru, 5,010,493, Cl 364-490.000
Yanai, Takeo, to Nippon Flute Co., Ltd. Bag making machine 5,009,740, Cl 156-353.000
Yarborough, David K. Method of protecting the mucous membranes of the mouth while treating teeth 5,009,885, Cl 424-53.000
Yardley, John P. *See*—
Abou-Gharbia, Magid A., Yardley, John P., and Childers, Wayne E., Jr., 5,010,078, Cl 514-252.000
Yasuda, Masashi, Uchimoto, Yoshihiro, and Mikata, Yasunori, to Bando Chemical Industries, Ltd., and Unico Co., Ltd. Apparatus for conveying dielectric sheets 5,009,352, Cl 226-94.000
Yasuda, Shigeru. *See*—
Sugimoto, Atsushi, Nakano, Osamu, Yasuda, Shigeru, Maeda, Chikatoshi, Ozone, Toshio, and Kawagoe, Makoto, 5,009,843, Cl 420-112.000
Yasui, Mitsuo, to Kabushikikaisha Kaichu Kyoju Kenkyu-sho. Water tank apparatus 5,009,188, Cl 119-3.000
Yasumura, Hiroto, Hirasawa, Masahide, Noji, Minoru, Kozuki, Susumu, Takahashi, Koji, and Yoshimura, Katsuji, to Canon Kabushiki Kaisha. Color video signal reproducing apparatus 5,010,416, Cl 358-314.000
Yatsu, Tadao. *See*—
Kohsaka, Masaki, Higashi, Isaburou, Akana, Yoshinori, Hashimoto, Mikio, and Yatsu, Tadao, 5,010,146, Cl 525-439.000
Yatsuka, Takeshi, Murata, Hiroshi, Mizumura, Yutaka, and Kotera, Nobukazu, to Ashland Oil, Inc. Magnetic recording medium prepared with polyurethane resin modified by a bicyclic amide acetal 5,009,960, Cl 428-423.100

Yeager, Michael W *See*—
Cox, Roger G., Reber, Mark A., and Yeager, Michael W., 5,010,509, Cl. 364-748.000
Yeates, Steven G., and Padget, John C., to Imperial Chemical Industries PLC Production of aqueous-based fluoropolymer compositions 5,010,121, Cl. 523-336.000
Yee, Keen Y Digital data capture for use with TV set or monitor 5,010,499, Cl. 364-521.000
Yelland, Michael, and Conway, John, to Imperial Chemical Industries PLC Pyridazinone manufacture 5,010,192, Cl. 544-239.000
Yellow Freight System, Inc *See*—
Ruder, Carl J., Haney, Ronald J., Chutorash, Richard J., Bostad, Wayne W., Zweig, Arnold A., and Payne, Lyle B., 5,009,560, Cl. 414-392.000
Yelverton, Elizabeth M *See*—
Levinson, Arthur, Simonsen, Christian, and Yelverton, Elizabeth M., 5,010,002, Cl. 435-69.200
Yen, Lung-Wu Foldable razor assembly 5,009,004, Cl. 30-47.000
Yi, Chong S Rotary internal combustion engine 5,009,206, Cl. 123-248.000
Yoder, Dennis G., to CTB, Inc Plank structure for boat dock and the like 5,009,045, Cl. 52-177.000
Yokogawa Electric Corporation *See*—
Harada, Kinji, Ikeda, Kyoichi, Kuwayama, Hideki, Kobayashi, Takashi, Nishikawa, Tadashi, Watanabe, Tetsuya, and Yoshida, Takashi, 5,009,108, Cl. 73-704.000
Yokohama Rubber Co., Ltd., The *See*—
Okumoto, Takaharu, Hayashida, Tadashi, Kawada, Kazuo, and Hayashi, Tetsuo, 5,009,423, Cl. 273-80.200
Okumoto, Takaharu, Ninomiya, Toshio, and Hayashi, Tstsuya, 5,009,425, Cl. 273-167.00R
Takano, Haruhiro, 5,010,142, Cl. 525-332.400
Yokomachi, Naoya *See*—
Ikeda, Hayato, Sawada, Masahiro, Nakamura, Norihiko, and Yokomachi, Naoya, 5,009,286, Cl. 184-6.170
Yokono, Wataru *See*—
Inoue, Hiroshi, Yokono, Wataru, and Okuda, Yasuji, 5,009,536, Cl. 401-198.000
Yokota, Mitsuo *See*—
Tanaka, Kazuyuki, Iwami, Etsuji, Matsuzawa, Jun, Mukoyama, Yoshiyuki, Shibata, Noriohiko, Hanawa, Akinori, and Yokota, Mitsuo, 5,009,949, Cl. 428-260.000
Yokoyama, Kenji, to Yamaha Corporation Acoustic apparatus 5,009,280, Cl. 181-160.000
Yokoyama, Kenji, to Yamaha Corporation Acoustic apparatus 5,009,281, Cl. 181-160.000
Yoneda, Kenzi, Ueshima, Takaaki, Kuzunuki, Soshiro, Morita, Yuzo, and Tobita, Toshimitsu, to Hitachi, Ltd Customer participatory elevator control system 5,010,472, Cl. 364-148.000
Yonehara, Takao *See*—
Tokunaga, Hiroyuki, Yamagata, Kenji, and Yonehara, Takao, 5,010,033, Cl. 437-83.000
Yoshida, Keiji, Funato, Ryo, Takahiro, Syuji, Kubo, Shinji, and Inagaki, Notoshi, to Mitsubishi Rayon Co., Ltd Preparation process for toner polymer 5,009,978, Cl. 430-109.000
Yoshida, Kimiyoshi, Sakano, Akio, Tamori, Hirofumi, and Chatani, Masayuki, to Sony Corporation Hand-written, on-line character recognition apparatus and method 5,010,579, Cl. 382-13.000
Yoshida, Satoshi, Nakahara, Toshiaki, Tanikawa, Hirohide, and Sakashita, Kiichiro, to Canon Kabushiki Kaisha Image forming method and image forming apparatus 5,009,973, Cl. 430-45.000
Yoshida, Shigemitsu *See*—
Fujita, Toshio, Yamashita, Yoshisato, Yoshida, Shigemitsu, and Yamahira, Katsutoshi, 5,009,696, Cl. 71-64.070
Yoshida, Suguru *See*—
Saitoh, Masahiro, Yoshida, Suguru, Obata, Kenichi, and Ono, Yoshinobu, 5,009,463, Cl. 296-210.000
Yoshida, Susumu, to Mitsubishi Denki Kabushiki Kaisha Tandem solar cell 5,009,719, Cl. 136-249.000
Yoshida, Takashi *See*—
Harada, Kinji, Ikeda, Kyoichi, Kuwayama, Hideki, Kobayashi, Takashi, Nishikawa, Tadashi, Watanabe, Tetsuya, and Yoshida, Takashi, 5,009,108, Cl. 73-704.000
Yoshikai, Takeshi *See*—
Higashio, Kimihiko, and Yoshikai, Takeshi, 5,010,363, Cl. 355-206.000
Yoshikawa, Akira, and Torikai, Setsuo, to NKG Insulators, Ltd Automatic chamfering machine 5,009,038, Cl. 51-126.000
Yoshikawa, Toshiharu, and Sugiura, Shozou, to Menicon Co., Ltd Ultraviolet-hardenable adhesive and bonding method employing same 5,009,731, Cl. 156-154.000
Yoshimoto, Masahiko, and Matsumura, Tetsuya, to Mitsubishi Denki Kabushiki Kaisha Dynamic semiconductor memory device formed by 2-transistor cells 5,010,519, Cl. 365-149.000
Yoshimura, Hironori, and Shyogo, Inada, to Mitsubishi Metal Corporation Microdrill bit 5,009,705, Cl. 75-240.000
Yoshimura, Katsuji *See*—
Yasumura, Hiroto, Hirasawa, Masahide, Noji, Minoru, Kozuki, Susumu, Takahashi, Koji, and Yoshimura, Katsuji, 5,010,416, Cl. 358-314.000
Yoshimura, Susumu *See*—
Yamashita, Akio, Yoshimura, Susumu, and Tsuchiya, Sohji, 5,009,958, Cl. 428-411.100
Yoshino, Akira *See*—
Mukai, Tadayoshi, and Yoshino, Akira, 5,010,287, Cl. 318-801.000
Yoshio, Junichi, Hosaka, Sumio, Matsuoka, Hisao, Tsuda, Youichirou, Katagiri, Shoichi, and Nomura, Satoru, to Pioneer Electronic Corporation Playback method for use in a recording medium playing apparatus using information control signals 5,010,417, Cl. 358-335.000
Yoshioka, Ritsuo *See*—
Ueda, Makoto, Ando, Yoshihira, Sakurai, Shungo, and Yoshioka, Ritsuo, 5,009,840, Cl. 376-435.000
Yost, Richard A., and Damerow, David H., to Harris Corporation Data overlap decoder 5,010,558, Cl. 375-37.000
Yotvat, Jacob *See*—
Lin, Israel J., and Yotvat, Jacob, 5,009,791, Cl. 210-695.000
Young, David R *See*—
Fisher, John M., and Young, David R., 5,009,249, Cl. 137-495.000
Young, Donald R., and Young, Ruth I Golf ball vending machine 5,009,330, Cl. 221-196.000
Young, Douglas G *See*—
Lipman, Kenneth, and Young, Douglas G., 5,010,470, Cl. 363-132.000
Young, Patrick H *See*—
Coates, Don M., and Young, Patrick H., 5,009,820, Cl. 264-13.000
Young, Ruby Y Cat restrainer 5,009,196, Cl. 119-101.000
Young, Ruth L. *See*—
Young, Donald R., and Young, Ruth L., 5,009,330, Cl. 221-196.000
Yu, Simon H P., to B F Goodrich Company, The Copolymers of ethylene oxide as antistatic additives 5,010,139, Cl. 525-187.000
Yuan, Han-Tzong *See*—
Reid, Lee R., and Yuan, Han-Tzong, 5,009,476, Cl. 350-96.110
Yuhasz, Donald E Method of playing a geographical map game 5,009,430, Cl. 273-255.000
Yukawa, Akira, to NEC Corporation Analog-to-digital converter having an excellent signal-to-noise ratio for small signals 5,010,347, Cl. 341-143.000
Yuki, Eiji *See*—
Kuzuya, Susumu, Shimizu, Seiji, Kato, Mikio, Ishikawa, Yujiro, Sakai, Takashi, and Yuki, Eiji, 5,009,530, Cl. 400-188.000
Yunoki, Masayuki *See*—
Tsuji, Tsuyoshi, Satoh, Masaaki, and Yunoki, Masayuki, 5,009,775, Cl. 210-85.000
Yurchak, Sergei *See*—
Avidan, Amos A., and Yurchak, Sergei, 5,009,851, Cl. 422-141.000
Yushio, Yasuhisa *See*—
Sasame, Akira, Sakanoue, Hitoyuki, Takeuchi, Hisao, Miyake, Masaya, Yamakawa, Akira, Yushio, Yasuhisa, and Akazawa, Hitoshi, 5,010,388, Cl. 357-70.000
Yuunaga, Toshifumi, to Suzuki Jidosha Kogyo Kabushiki Kaisha Air cleaner of engine for vehicle 5,009,686, Cl. 55-419.000
Zahnfabrik Friedrichshafen AG *See*—
Meisinger, Erwin, and Zimmer, Jurgen, 5,009,126, Cl. 74-733.100
Zahnradfabrik Friedrichshafen, AG *See*—
Lang, Armin, and Schweizer, Bernhard, 5,009,110, Cl. 73-862.330
Zahradnicek, Ales *See*—
Kunz, Reiner, Babl, Albert, Zahradnicek, Ales, and Dietrich, Rainer, 5,009,674, Cl. 51-295.000
Zama, Yoshiaki *See*—
Umeda, Itsuki, Takashima, Masaaki, Zama, Yoshiaki, Takemura, Yasuhiko, Funabashi, Yuichi, Watanabe, Junichiro, Takeda, Kiyoshi, and Matsumoto, Makoto, 5,010,137, Cl. 525-104.000
Zapfel, Horst *See*—
Traubel, Harro, Strenger, Heinrich, Weber, Karl A., Muller, Hans-Werner, Zapfel, Horst, and Hummel, Axel, 5,009,921, Cl. 427-31.000
Zare, Richard N., Huang, Xiaohua, and Ohms, Jack I., to Leland Stanford Junior University, Board of Trustees of the System for measuring electrokinetic properties and for characterizing electrokinetic separations by monitoring current in electrophoresis 5,009,760, Cl. 204-183.300
Zavatone, James F Bridge separated tray and blank for forming it 5,009,363, Cl. 229-120.170
Zdybel, Frank, Jr *See*—
Makkuni, Ranjit, Zdybel, Frank, Jr., and Stults, Robert A., 5,010,500, Cl. 364-521.000
Zelko, William E *See*—
Fogg, Michael W., Koegel, Keith S., Shuey, John R., Zelko, William E., and Beamenderfer, Robert E., 5,009,614, Cl. 439-497.000
Zemek, Michal *See*—
Pajgrt, Jan, Smetak, Vincenc, Kalina, Jaroslav, Zemek, Michal, Pus, Milan, and Bucek, Pavel, 5,009,253, Cl. 139-116.200
Zenith Data Systems Corporation *See*—
Krenz, Horst M., 5,010,426, Cl. 360-97.010
Zeugner, Horst *See*—
Waldeck, Harald, Benson, Werner, Zeugner, Horst, Wolf, Klaus-Ulrich, Gregory, Peter-Colin, Hamminga, Derk, and van Wijngaarden, Ineke, 5,010,076, Cl. 514-221.000
Zhukov, Jury K *See*—
Lupukhin, Jury V, Danilov, Leonid I., Ivoditov, Albert N., Garber, Eduard A., Subbotin, Anatoly N., Pavlov, Valentin P., Zhukov, Jury K., and Pimenov, Alexandr F., 5,009,037, Cl. 51-7.000
Ziggity Systems, Inc *See*—
Hostetler, Eldon, 5,009,194, Cl. 119-72.000
Zimmer, Jurgen *See*—
Meisinger, Erwin, and Zimmer, Jurgen, 5,009,126, Cl. 74-733.100
Zimmerman, Peter *See*—
Schmidt, Richard R., Baer, Thomas, Zimmerman, Peter, and Wendel, Albrecht, 5,010,059, Cl. 514-25.000
Zimmermann, Arnold Closure clip, especially for the closure of bags and a method and machine for applying the same 5,008,980, Cl. 24-30.50R

Zinsmeyer, Thomas M., to Carrier Corporation Refrigerant flow control device 5,009,079, Cl. 62-218.000
Zisa, Michele, and Palara, Sergio, to SGS-Thomson Microelectronics s.r.l. Control circuit for the clamping voltage of an inductive load driven by a power device in a high side driver configuration 5,010,439, Cl. 361-91.000
Ziuchkovski, Michael J., to Planar Systems, Inc Driving network for TFEL panel employing a video frame buffer 5,010,325, Cl. 340-781.000
Zmuda, James E *See*
Bathrick, Erwin W., and Zmuda, James E., 5,010,572, Cl. 380-21.000
Znaiden, Alexander P *See*—
Wilmott, James M., Koelle, William H., and Znaiden, Alexander P., 5,010,110, Cl. 514-758.000
ZVS Vyzkumnevyvojovy ustav *See*—
Pajgrt, Jan, Smetak, Vincenc, Kalina, Jaroslav, Zemek, Michal, Pus, Milan, and Bucek, Pavel, 5,009,253, Cl. 139-116.200
Zweig, Arnold A *See*—
Ruder, Carl J., Haney, Ronald J., Chutorash, Richard J., Bostad, Wayne W., Zweig, Arnold A., and Payne, Lyle B., 5,009,560, Cl. 414-392.000
Zwicker, Horst Method of forming pretzels from strands of dough 5,009,910, Cl. 426-499.000
3TL Trading Co *See*—
Laakso, Timo, 5,009,278, Cl. 180-9.440
501 Greenwich Pharmaceuticals Incorporated *See*—
Ronsen, Bruce, Arora, Sudershan K, and Thomas, Albert V., 5,010,058, Cl. 514-23.000

LIST OF REISSUE PATENTEES

TO WHOM

PATENTS WERE ISSUED ON THE 23RD DAY OF APRIL, 1991

NOTE.—Arranged in accordance with the first significant character or word of the name (in accordance with city and telephone directory practice)

Ballheimer, Benny, and Stratton, Michael K., to Caterpillar Inc. Internal combustion engine noise reduction plate. Re. 33,575, Cl. 123-198.00E.

Caterpillar Inc. *See*—
Ballheimer, Benny, and Stratton, Michael K., Re. 33,575, Cl. 123-198.00E.

Eaton Corporation. *See*—
Latsko, James M., Re. 33,576, Cl. 192.88.00B.

Farrall, George A. *See*—
Harnden, John D., Jr., Kornrumpf, William P., and Farrall, George A., Re. 33,577, Cl. 310-332.000.

General Electric Company. *See*—
Harnden, John D., Jr., Kornrumpf, William P., and Farrall, George A., Re. 33,577, Cl. 310-332.000.

Harnden, John D., Jr.; Kornrumpf, William P., and Farrall, George A., to General Electric Company. Advanced piezoceramic power switching devices employing protective gastight enclosure and method of manufacture. Re. 33,577, Cl. 310-332.000.

Kirk, Alan R., and Scherrer, Robert A., to Riker Laboratories, Inc. Substituted biphenyl derivatives. Re. 33,574, Cl. 514-563.000.

Kornrumpf, William P. *See*—
Harnden, John D., Jr., Kornrumpf, William P., and Farrall, George A., Re. 33,577, Cl. 310-332.000.

Latsko, James M., to Eaton Corporation. Coupling assembly and friction shoe therefor. Re. 33,576, Cl. 192.88.00B.

Riker Laboratories, Inc. *See*—
Kirk, Alan R., and Scherrer, Robert A., Re. 33,574, Cl. 514-563.000.

Scherrer, Robert A. *See*—
Kirk, Alan R., and Scherrer, Robert A., Re. 33,574, Cl. 514-563.000.

Stratton, Michael K. *See*—
Ballheimer, Benny, and Stratton, Michael K., Re. 33,575, Cl. 123-198.00E.

LIST OF REEXAMINATION PATENTEES

TO WHOM

CERTIFICATES WERE ISSUED

deRojas, Edward. *See*—
Frieder, Philip M., and deRojas, Edward, B1 4,645,317, Cl. 351-164.000.

Frieder, Philip M., and deRojas, Edward, to Optical Systems International, Inc. Eyeglass lens modules and method. B1 4,645,317, 4-23-91, Cl. 351-164.000.

M & I Door Systems Limited. *See*—
Palmer, Glenn R., B1 4,478,268, Cl. 160-310.000.

Optical Systems International, Inc. *See*—
Frieder, Philip M., and deRojas, Edward, B1 4,645,317, Cl. 351-164.000.

Palmer, Glenn R., to M & I Door Systems Limited. Door structure. B1 4,478,268, 4-23-91, Cl. 160-310.000.

LIST OF DESIGN PATENTEES

A. I. Hansen Manufacturing Company. *See*—
Hansen, Randall C., and Krahn, Gilbert H., 316,365, Cl. D8-331.000.
Hansen, Randall C., and Krahn, Gilbert H., 316,366, Cl. D8-331.000.

Abbestam, Goran, and Lachonius, Leif. Beam. 316,444, 4-23-91, Cl. D25-122.000.

Advanced Products and Technologies, Inc. *See*—
VanNoy, Allen W., 316,412, Cl. D14-158.000.

Aladdin Industries. *See*—
Bridges, John A., and Booten, Richard D., 316,331, Cl. D3-74.000.

Aladdin Industries Inc. *See*—
Bridges, John A., and Booten, Richard D., 316,332, Cl. D3-74.000.

Aloka Co., Ltd. *See*—
Kijima, Masaichi, and Yajima, Nobumichi, 316,448, Cl. D24-26.000.

Andersen, Edel S., to Interlego AG. Toy building element. 316,430, 4-23-91, Cl. D21-108.000.

Anderson, John W., to Temp-Tech Co. Inc. Food serving tray. 316,359, 4-23-91, Cl. D7-549.000.

Anson, Karen K. Combination baby cooling pad and cover therefor. 316,352, 4-23-91, Cl. D6-596.000.

Aoyama, Minoru, Komada, Takeshi, and Hirata, Tomohiko, to Canon Kabushiki Kaisha. Copying machine. 316,425, 4-23-91, Cl. D18-19.000.

Aoyama, Minoru. *See*—
Komada, Takeshi, Hirata, Tomohiko, and Aoyama, Minoru, 316,424, Cl. D18-39.000.

Arginsky, Richard C., to Plush Factory Inc., The. Combined stuffed toy and transparent container therefor. 316,439, 4-23-91, Cl. D21-159.000.

Austin, Donald P., Lawrence, Albert L., and Prewitt, Arthur C., to Gilbarco Inc. Credit and debit authorization panel or similar article. 316,471, 4-23-91, Cl. D99-43.000.

Australux North America, Ltd. *See*—
Spotts, James C., and Chai, Haw R., 316,458, Cl. D26-67.000.

Baber, Kevin R., to Smiths Industries Public Limited Company. Surgical drainage container. 316,450, 4-23-91, Cl. D24-58.000.

Baker, Larry. Cover for an automobile-type cigarette lighter receptacle. 316,402, 4-23-91, Cl. D13-156.000.

Batts, Inc. *See*—
Duester, Everett L., 316,334, Cl. D6-328.000.

Baxter International Inc. *See*—
D'Aquino, Michael, and Becker, Julius, 316,449, Cl. D24-29.000.

Beaudry, Steven A. Support pedestal for a table. 316,350, 4-23-91, Cl. D6-495.000.

Becker, Julius. *See*—
D'Aquino, Michael, and Becker, Julius, 316,449, Cl. D24-29.000.

Benson, Steven R. Turbine housing. 316,418, 4-23-91, Cl. D15-5.000.

Black & Decker Inc.: *See*—

THE OFFICIAL GAZETTE (PATENT SECTION), issued weekly.
THE OFFICIAL GAZETTE (TRADEMARK SECTION), issued weekly.
GENERAL INFORMATION concerning PATENTS.
GENERAL INFORMATION concerning TRADEMARKS.

COPIES OF PATENTS are furnished by the Patent and Trademark Office at $1.50 each; PLANT PATENTS in color, $10.00 each; copies of TRADEMARKS at $1.50 each. Address orders to the Commissioner of Patents and Trademarks, Washington, D.C., 20231.

Printing authorized by Section 11(a)3 of Title 35, U.S. P.T.O.

290-991 O.G.-91-1

PATENT AND TRADEMARK OFFICE NOTICES

Patent Cooperation Treaty (PCT) Information

For information concerning the PCT member countries see the notice appearing in the *Official Gazette* at 1118 O.G. 54 on Nov. 27, 1990.

For use of the European Patent Office as an International Searching Authority for international applications filed in the United States Receiving Office, see the notice appearing in the *Official Gazette* at 1022 O.G. 52 on Sept. 28, 1982.

For use of the European Patent Office as an International Preliminary Examining Authority for international applications filed in the United States Receiving Office, see the notices appearing in the *Official Gazette* at 1080 O.G. 2 on July 7, 1987 and at 1091 O.G. 2 on June 7, 1988. There is no longer a limit on the number of such international applications accepted for international preliminary examination by the European Patent Office; see the notice appearing at 1116 O.G. 32, on July 17, 1990.

The search fee of the European Patent Office was changed due to a difference in the exchange rate of the U.S. dollar in relation to the German Mark as of Jan. 3, 1991, and was announced in the *Official Gazette* at 1122 O.G. 564 on Jan. 1, 1991.

International PCT fees were changed on March 1, 1991 due to a difference in the exchange rate of the U.S. dollar in relation to the Swiss Franc and were announced in the *Official Gazette* at 1122 O.G. 629 on Jan. 22, 1991.

Certain domestic PCT fees and charges for International Search and Preliminary Examination have been changed effective Apr. 17, 1989 and were announced in the *Official Gazette* at 1100 O.G. 24 on Mar. 7, 1989.

The current schedule of PCT fees (in U.S. dollars) is as follows:

Transmittal fee:	170.00
Search Fee	
U.S. Patent and Trademark Office (USPTO) as International Searching Authority (ISA)	
—No corresponding prior U.S. national application filed	550.00
—Corresponding prior U.S. national application filed	380.00
—Supplemental search fee, per additional invention	150.00
European Patent Office as ISA	1492.00
Preliminary examination fee	
USPTO as International Preliminary Examining Authority (IPEA)	
—Search fee paid to USPTO as ISA	400.00
—Additional examination fee, per additional invention	130.00
—ISA not the USPTO	600.00
—Additional examination fee, per additional invention	200.00
International fees	
Basic fee	559.00
Basic Supplemental fee (for each page over 30)	11.00
Designation fee per country or region for the first 10 national or regional offices	135.00
Designation fee for 11th and subsequent designations	No Charge
Handling fee	171.00

U.S. National Stage fees

	Small Entity	Regular
USPTO was IPEA	165.00	330.00

Notice of Maintenance Fees Payable

Title 37, Code of Federal Regulations, Section 1.362(d), effective Nov. 1, 1984, provides that maintenance fees may be paid without surcharge for a six-month period beginning 3, 7, and 11 years after the date of issue of patents based on application filed on or after Dec. 12, 1980. An additional six-month grace period is provided by 35 U.S.C. 41(b) and 37 CFR 1.362(e) for payment of the maintenance fee with the surcharge set forth in 37 CFR 1.20(k) or (l), as amended effective Apr. 17, 1989. If the maintenance fee is not paid in a patent requiring such payment the patent will expire on the 4th, 8th or 12th anniversary of the patent.

Attention is drawn to the patents which were issued on April 26, 1988 for which maintenance fees due at 3 years and six months may now be paid. The patents have patent numbers within the following ranges:

Utility Patents 4,739,522 through 4,741,049
Reissue Patents based on the above identified patents.

Attention is drawn to the patents which were issued on April 24, 1984 for which maintenance fees due at 7 years and six months may now be paid. The patents have patent numbers within the following ranges:

Utility Patents 4,443,891 through 4,445,230
Reissue Patents based on the above identified patents.

No maintenance fees are required for design or plant patents.

Payments of maintenance fees in patents should be directed to "Commissioner of Patents and Trademarks, Box M. Fee, Washington, D.C. 20231."

The current amounts of the maintenance fees due at 3 years and six months and seven years and six months are set forth in 37 CFR 1.20(e) and (f), as amended Nov. 5, 1990, which are reproduced below:

37 CFR § 1.20 Post-issuance fees and surcharges

"(e) For maintaining an original or reissue patent, except a design or plant patent, based on an application filed on or after after Dec. 12, 1980 and before Aug. 27, 1982, in force beyond 4 years; the fee is due by three years and six months after the original grant $245.00

"(f) For maintaining an original or reissue patent, except a design or plant patent, based on an application filed on or after Dec. 12, 1980 and before Aug. 27, 1982, in force beyond 8 years; the fee is due by seven years and six months after the original grant .....$495.00"

"(h) For maintaining an original or reissue patent except a design or plant patent, based on an application filed on or after Aug. 27, 1982, in force beyond 4 years; the fee is due by three years and six months after the original grant:

By a small entity (§1.9(f)) $415.00
By other than a small entity ..... $830.00"

"(i) For maintaining an original or reissue patent, except a design or plant patent, based on an application filed on or after Aug. 27, 1982, in force beyond 8 years; the fee is due by seven years and six months after the original grant:

By a small entity (§1.9(f)) $835.00
By other than a small enttity ..... $1670.00"

The amounts of the surcharges for paying the maintenance fee during the grace period or after the expiration of the patent are set forth in 37 CFR 1.20(k), (l) and (m), which are reproduced below:

"(k) Surcharge for paying a maintenance fee during the 6-month grace period following the expiration of three years and six months , seven years and six months, and eleven years and six months after the date of the original grant of a patent based on an application filed on or after Dec. 12, 1980 and before Aug. 27, 1982 ..... $120.00"

"(l) Surcharge for paying a maintenance fee during the 6-month grace period following the expiration of three years and six months, seven years and six months, and eleven years and six months after the date of the original grant of a patent based on an application filed on or after Aug. 27, 1982:

By a small entity(§1.9(f)) $60.00
By other than a small entity ..... $120.00"

"(m) Surcharge for accepting a maintenance fee after expiration of a patent for non-timely payment of a maintenance fee where the delay is shown to the satisfaction of the Commissioner to have been unavoidable ..... $550.00"

Notice of Expiration of Patents Due to Failure to Pay Maintenance Fees

35 U.S.C. 41 and 37 CFR 1.362(g) provide that if the required maintenance fee and any applicable surcharge are not paid in a patent requiring such payment, the patent will expire at the end of the 4th, 8th, or 12th anniversary of the grant of the patent depending on the first maintenance fee which was not paid.

According to the records of the Office, the patents listed below have expired due to failure to pay the required maintenance fee and any applicable surcharge.

PATENTS WHICH EXPIRED FEBRUARY 17, 1991 DUE TO FAILURE TO PAY MAINTENANCE FEES

REISSUE APPLICATIONS FILED

Notice under 37 CFR 1.11(b) The reissue applications listed below are open to inspection by the general public in the indicated Examining Groups and copies may be obtained by paying the fee therefor (37 CFR 1.21(b).

4,417,591 Re. S. N. 07/663,070, Filed Feb. 28, 1991, Cl. 128, APPARATUS AND METHOD FOR TOPOGRAPHIC DISPLAY OF MULTICHANNEL EEG DATA, Norman D. Culver, Owner of Record: *Nicolet Instrument Corporation*, Attorney or Agent: James M. Smith, Ex. Gp.: 335

4,778,431, Re. S. N. 07/599,317, Filed Oct. 17, 1990, Cl. 446/221, ANIMATED BALLOONS, Joseph E. Dudley, Owner of Record: *Inventor*, Attorney or Agent: Herbert D. Hart, Ex. Gp.: 331

4,809,422, Re. S. N. 07/665,590, Filed Mar. 6, 1991, Cl. 29/568, MACHINE TOOL WITH INDEX MEANS, Koichiro Kitamura, Owner of Record: *Kitamura Machinery Co., Ltd., Toyama-Ken, Japan*, Attorney or Agent: Herbert I. Cantor, Ex. Gp.: 322

4,809,539 Re. S. N. 07/666,150, Filed Mar. 5, 1991, Cl. 73/116, REMOTE MIXTURE CONTROL TOOL WITH CLEANING FUNCTION, Lynn R. Goodman, Owner of Record: *Diag. Inc., Santa Ana, Calif.*, Attorney or Agent: Lowell Anderson, Ex. Gp.: 265

4,809,633, Re. S. N. 07/670,348, Filed Mar. 15, 1991, Cl. 114/210, FREE FALL WINDLASS, Jose Santos, Owner of Record: *Scott Fetzer Company, Bridgeport, Conn.*, Attorney or Agent: James E. Barlow, Ex. Gp.: 315

4,810,498, Re. S. N. 07/665,031, Filed Mar. 6, 1991, Cl. 424/195.1, NAIL OIL COMPOSITION, Paul J. DiMeglio, Owner of Record: *Peau Corp., Dumfries, Va.*, Attorney or Agent: Alan E. Schiavelli, Ex. Gp.: 183

4,811,172, Re. S. N. 07/666,118, Filed Mar. 6, 1991, Cl. 362/61, LIGHTING SYSTEMS EMPLOYING OPTICAL FIBERS, John M. Davenport, et al., Owner of Record: *General Electric Co., Schenectady, N.Y.*, Attorney or Agent: George E. Hawranko, Ex. Gp.: 346

4,811,735, Re. S. N. 07/668,670, Filed Mar. 13, 1991, Cl. 128/305, STONE DESTROYING CATHERTER AND METHOD OF USE, John Nash, et al., Owner of Record: *Kensey Nash Corp., Exton, Pa.*, Attorney or Agent: Martin L. Faigus, Ex. Gp.: 345

4,812,319, Re. S. N. 07/667,284, Filed Mar. 11, 1991, Cl. 426/127, SHEET MATERIALS AND PACKAGING THEREFROM, Joseph C. Hsu, et al., Owner of Record: *American National Can Company, Chicago, Ill.*, Attorney or Agent: Thomas A. O'Rourke, Ex. Gp.: 132

4,813,584, Re. S. N. 07/670,700, Filed Mar. 18, 1991, Cl. 224/42.44, DETACHABLE CARGO CARRIER, Michael D. Wiley, Owner of Record: *Inventor*, Attorney or Agent: Douglas W. Sprinkle, Ex. Gp.: 243

4,865,686, Re. S. N. 07/608,397, Filed Nov. 2, 1990, Cl. 156/643, LASER SCRIBING METHOD, Hisato Shinohara, Owner of Record: *Semiconductor Energy Laboratory Co., Ltd., Atsugi-Shi, Japan*, Attorney or Agent: Donald R. Strudebaker, Ex. Gp.: 133

4,867,106, Re. S. N. 07/670,712, Filed Mar. 18, 1991, Cl. 122/13.00R, DIRECT POWER VENTED WATER HEATER, Charles W. Staats, Owner of Record: *Bradford-White Corporation, Philadelphia, Pa.*, Attorney or Agent: Austin R. Miller, Ex. Gp.: 344

4,871,312, Re. S. N. 07/668,911, Filed Mar. 13, 1991, Cl. 433/164, DENTAL COMPACTOR INSTRUMENT, Derek E. Heath, Owner of Record: *Quality Dental Products, Inc., Johnson City, Tenn.*, Attorney or Agent: Charles B. Elderkin, Ex. Gp.: 333

4,892,399 Re. S. N. 07/664,949, Filed Mar. 5, 1991, Cl. 350/569, DOOR VIEWER, Chul Hoon Ahn, Owner of Record: *Seung Hee Han, Seoul, Republic of Korea*, Attorney or Agent: William J. Sapone, Ex. Gp.: 257

REQUESTS FOR REEXAMINATION FILED

Notice under 37 CFR 1.11(c). The requests for reexamination listed below are open to inspection by the general public in the indicated Examining Groups. Copies of the requests and related papers may be obtained by paying the fee therefor established in the Rules (37 CFR 1.19(a).

In the event correspondence to the patent owner is not received, this notice will be considered to be constructive notice to the patent owner and reexamination will proceed (37 CFR 1.248(a)(5) and 1.525(b).

4,574,914, Reexam. No. 90/002,301, Requested Mar. 21, 1991, Cl. 181/268, COMPACT, SOUND-ATTENUATING MUFFLER FOR HIGH-PERFORMANCE INTERNAL COMBUSTION ENGINE, Ray T. Flugger, Owner of Record: *Flowmaster Inc., Santa Rosa, Calif.*, Attorney or Agent: Robert B. Chickering, Flehr, Hohbach, Albritton, et al., San Fransisco, Calif., Ex. Gp.: 213, Requester: Owner

4,640,719, Reexam. No. 90/002,295, Requested Mar. 13, 1991, Cl. 134/040, METHOD FOR PRINTED CIRCUIT BOARD AND/OR PRINTED WIRING BOARD CLEANING, Michael E. Hayes, et al., Owner of Record: *Petroferm, Inc., Fernandina, Fla.*, Attorney or Agent: Joseph F. Posillico, Synnestvedt & Lechner, Philadelphia, Pa., Ex. Gp.: 132, Requester: Owner

4,719,852, Reexam. No. 90/002,296, Requested Mar. 15, 1991, Cl. 100/299.A, AIRCRAFT TRASH COMPACTOR, James L. Durbin, et al., Owner of Record: *Aero-Design Tech., Inc., Valencia, Calif.*, Attorney or Agent: John D. Bauerfield, Kelly, Bauerfield & Lowery, Woodland Hills, Calif., Ex. Gp.: 247, Requester: Owner

4,753,801, Reexam. No. 90/002,303, Requested Mar. 22, 1991, Cl. 424/465, SUSTAINED RELEASE TABLETS, Peter L. Oren, et al., Owner of Record: *Eli Lilly & Co., Indianapolis, Ind.*, Attorney or Agent: Bruce J. Barclay, Indianapolis, Ind., Ex. Gp.: 152, Requester: Dianne B. Elderkin, Woodcock, Washburn, Kurtz, et al., Philadelphia, Pa.

Errata

In the list of patents which expired on Sept. 16, 1990, due to failure to pay maintenance fees, in the O.G. of Nov. 27, 1990, the following patent should not have appeared:

Patent No.	Serial No.	Issue Date	Filing Date
4,612,648	06/692,787	9/16/86	1/17/85

"All reference to Reexamination Certificate No. B1 4,315,398 (1415th) appearing in the Official Gazette of Feb. 19, 1991 should be deleted since no reexamination certificate has been granted."

Service by Publication

A petition to cancel the registration identified below having been filed, and the notice of such proceeding sent by registered mail to registrant at the last known address having been returned by the Postal Service as undeliverable, notice is hereby given that unless the registrant listed herein, its assigns or legal representatives shall enter an appearance within thirty days from the date of this publication, the cancellation will be proceeded with as in the case of default.

Wilbur L. Krause, Kenmore, Wash., Reg. 1,504,893, for the mark "WET SPOT", Canc. No. 19,492.

JEAN BROWN
Administrator, Trademark
Trial and Appeal Board
For JEFFREY M. SAMUELS
Assistant Commissioner for Trademarks

Status of PTO Services

The following is an update of the status of PTO services for Mar. 1991:

Service Item	FY 1990 Goal (Calendar Days)*	Monthly Average (Calendar Days)*
Filing Receipts:		
Patents	22	18
Trademarks	30	53
Patent/Trademark Copies:		
Special Window Coupons	24 Hours	16 Hours
Window Coupons	5	2
Mail Coupons	12	5
Letter Orders	16	13
Electronic Ordering Service (EOS)	11	3
Certified Copies:		
Trademark Registrations	21	21
Applications-As-Filed	17	10
File-Wrapper/Contents	N/A	19
Walk-up Certification	1	1
Patent Application Expedited	5	5
Trademark Search Library:		
Filing Pending Marks	23	27
Filing Reg. Certificates	Issue Date+2 days	On Goal
Filing Temp. Drawings	8	13
Assignments:		
Recording Patent-New Applications	20**	15
Recording Patent-Mail Room Recpts.	20	19
Return Patents-New Applications	34**	43
Return Patents-Mail Room Recpts.	34	45
Recording Trademarks	20	19
Returning Trademark Documents	34	40
Avg. Days from Issue Fee Payment to Issue Date	90-100	118
Issue Fee Receipts Mailed	4 weeks prior to Issue Date	On Time
Patent Copies Available	95% on Issue Date	90% on Issue Date + 5
Trademark Copies Available	95% on Issue Date	98% on Issue Date

* Unless otherwise noted.
** Goal reflects the number of days from the date the filing receipt is mailed.

IMPROVEMENTS TO SERVICES

•*Trademark Assignment Processing System (TAPS)*• A new automated TAPS became operational on February 4, 1991. This new automated system was developed to improve the quality of the assignment recordation process and the file integrity of the Assignment search files by eliminating the typing and filing of trademark assignment records in the Assignment Search Room.

Typing of cards for the Assignment search files has been replaced with direct key entry into TRAM. Recordation notices, which had not previously been provided, are now being generated for each trademark assignment document processed and accompany all returned documents. Computer terminals containing the assignment information keyed in TRAM are available for public searching in the Assignment Search Room.

•*New Special PTO Mail Box*• The Correspondence and Mail Division has established a special box, Box DD, to expedite processing of Disclosure Documents. Currently, anyone filing a disclosure document or sending material relating to the program would mail the document/material to the Commissioner Patent and Trademark Office, Washington, D.C. 20231. As a result, the disclosure document would be processed along with the thousands of other pieces of mail sent to the same address.

By establishing Box DD, the Correspondence and Mail Division can readily identify an incoming disclosure document or related information by the unique mailing address on the envelope. The envelope will be sorted from the remainder of the mail and forwarded directly to the Correspondence Branch which handles this program.

When sending disclosure documents to the Patent and Trademark Office, the envelope should be addressed as follows:

Box DD
Commissioner of Patents and Trademarks
Washington, D.C. 20231

Box DD should also be typed/written in the lower left-hand corner of the envelope.

Please remember that only disclosure documents or material related to the disclosure document program should be placed in the envelope addressed to Box DD. Otherwise, processing of the unrelated material may be delayed.

•*Certification Process Review Team*• The Office is conducting a complete review of certification processing with the goal of streamlining operations to better meet customer needs. All of the supervisors and managers in the certification area, as well as employees, are involved.

As part of the review, several meetings with certification custmomers have been held to ensure that customer views are heard and to share the findings and recommendations derived during the certification process review. Customer meetings will continue to be held the third Wednesday of each month. Anyone interested in attending these meetings should contact the Assignment/Certification Services Division at 703-557-1552.

The Certification Process Review Team, along with volunteers from the public user group, are working to develop a form for use in ordering certified copies from the Certification Branch. The form will serve as an easy to use order blank, and will also include definitions of the various types of documents to ensure that the document requested by the customer is provided by the Certification Branch. The form is in draft stage and will be available within a few months.

Until the order form containing definitions of the various types of documents is available, the guidance for requesting certification services is provided in the following Helpful Hints notice under *Certification Services*.

Apr. 5, 1991

THERESA A. BRELSFORD
Assistant Commissioner
for Administration

HELPFUL HINTS

•*Trademark Assignments•Review of Recordation Notices*

Since recordation notices are now provided for all trademark assignments being recorded, requestors of assignment recordation services now have the opportunity to ensure that information was properly recorded. Please carefully review each recordation or non-recordation notice. Errors on the recordation notices represent errors in the TAPS. If you should find any errors, please send a request for correction to:

U.S. Patent and Trademark Office
Assignment Branch
CP2-5C14
Washington, D.C. 20231

Assignments with Multiple Properties

When submitting trademark assignments which contain multiple properties, please ensure that the lists of property numbers appear in numeric order with application numbers and registration numbers separated. Lists which are out of numeric order or mix application and registration numbers require additional processing steps and, therefore, slow down the recordation process.

•*Certification Services*•Following is a series of helpful hints that have been developed to date as a result of the meetings with customers and the Certification Process Review Team meetings.

Provide complete information for all requests:

—Service requested (e.g., Certified Copies of *enter type of document requested)*
—Requestor's name or company
—Date of request
—Address of requestor
—Daytime telephone number
—Deposit account or method of payment information
—Address or local PTO Box Number to which copies should be sent
—Complete application number, patent number, or trademark number of document requested (The application number must include the two-digit series code such as 06 or 07 for patent applications and 73 or 74 for trademark applications, and the six-digit serial number).
—Any additional information as might be necessary (see specific types of documents below).

Separate requests for ordering different products

When ordering copies from the Certification Branch, request only one type of service per order to speed processing. Example: a request for a copy of a patent application as filed should be separate from a request for a patent file wrapper and contents.

Ensure authorization to order certified copies of applications as filed

When requesting a certified copy of a patent application as filed, if either the attorney of record has changed since filing or a power to inspect has been filed, please provide a copy of the new power of attorney or the power to inspect. The Certification Branch prepares the bulk of certified copies of applications as filed from microfiche that contains information pertaining to the attorney of record at the time of filing. When a change in attorney of record is made, or when a power to inspect has been filed, this information is not readily available to the Certification Branch unless it is provided with the request.

Limit the number for each expedited order for certified copies of patent application as filed

When submitting requests for expedited certified copies of patent applications as filed, please include no more than three different application numbers on one request. The Certification Branch fills all copies from one request as a complete order. The Office's experience has been that orders which have no more than three application numbers can be filled and delivered most quickly within our five-day service goal; orders with a large number of individual application numbers often result in one or more applications requiring special research or handling which can slow the process. For example, better service can usually be given on five individual orders with three application numbers on each one rather than one order with 15 application numbers on it.

In addition, some customers are using terms such as "rush" or "special" on every order they place; other customers use those terms to identify requests they want to be filled within five days. Please refrain from using the words such as "rush" or "special" and only use the term "expedite" when you have requested and paid for five-day expedited service.

Do not request refunds unless the Office failed to properly fulfill the request.

The Patent and Trademark Office is prohibited from providing refunds to customers except where the fee is paid by actual mistake or in excess, such as a payment not required by law, or in situations where the Office failed to properly fulfill the request. The

Certification Branch, therefore, cannot provide refunds for customers who no longer need a service or for "a mere change of purpose after the payment of money." See 37 CFR 1.26.

Note specific guidance below for each type of document requested.

Patent Applications as Filed

These documents are also frequently called "priority documents" or "foreign priority documents." Please refer to these documents as **Patent Applications as Filed** when requesting certification services.

— 17 Calendar Day Regular Service
— 5 Calendar Day Expedited Service
$10.00 for Regular Service per certified copy
$20.00 for Expedited Serivce per certified copy

Papers supplied are:
Patent application (including specification, claim, abstract (if any))
Any Drawings

If the person requesting the certified copy is not the same as one of the attorney names on the power of attorney originally filed with the application, a power of attorney or power to inspect must be provided for each appliation requested.

If the application as filed being requested is Rule 1.62 file wrapper continuation application, please indicate this on your request. In addition, please provide the parent application number(s) for each Rule 1.62 application.

Uncertified copies of patent applications as filed can also be provided by the Certification Branch. Fulfillment times and costs are the same as for certified copies.

To speed processing, the Certification Branch has instituted a new processing step in the fulfillment of certified copies of patent applications as filed. Within the first day of receipt of these orders, a check is made of the file of microfiche of patent applications as filed. If a microfiche is not available for fulfillment of the order, steps are immediately taken to order the actual file for fulfillment. Certification Branch employees will also call the customer to alert them of the potential for delayed receipt of copies when the microfiche is not available. Therefore, please include a current telephone number on all orders for patent applications as filed. The turnaround time for regular orders (17 days) can normally still be met if the microfiche is missing; the 5-day goal for expedited orders is more difficult to meet when the file must be ordered.

Patent File Wrapper and Contents

These documents are also frequently called "file history," "file history of an application" and "prosecution file." Please refer to these documents as **Patent File Wrapper and Contents** when requesting certification service.
— 25 Calendar Day Service
$170.00 per certified copy
Papers supplied are:

Face of file wrapper
Transmittal letter
Fee record sheet
Patent application, (including specification, claims, abstract (if any)), oath or declaration
Drawings
Papers in numerical order (per table of contents)
Table of contents

A power of attorney or power to inspect must be provided for each pending or abandoned file requested unless the power of attorney or power to inspect was submitted with the application and the requestor is listed on that power.

Uncertified copies of patent file wrappes and contents can also be provided by the Certification Branch. Fulfillment times and costs are the same as for certified copies.

Issued Patents

Certified Copy of Issued Patent

— 17 Calendar Day Service
$4.50 per certified copy of an issued patent *except* for a plant patent
$13.00 certified copy of an issued plant patent

Uncertified copies of issued patents CANNOT be provided by the Certification Branch. Requests for regular, uncertified patent copies can be ordered through the PTO's normal copy fulfillment service:

Commissioner of Patents and Trademarks
Box 9
Washington, D.C. 20231

The cost for an uncertified copy of an issued patent is $1.50. An uncertified copy of a plant patent is $10.00.

Patent Customer Supplied Copies

Certification of Copy of Patent Document Supplied by the Customer (These documents commonly include U.S. Patents; file wrappers and contents; selected papers from a file wrapper; classification listings and PTO publications). This service is only available to local customers because they must provide the actual source document and a complete copy produced from the actual source document.

— Next Calendar Day Service

$10.00 for Next Calendar Day Service per certified copy

A clean copy of the documents must be submitted along with the request for this service. CUSTOMERS MAY NOT SUBMIT COPIES OF PATENT APPLICATIONS AS FILED FOR THIS SERIVCE.

Trademark Application As Filed

These documents are also frequently called "priority documents" or "foreign priority documents." Please refer to these documents as **Trademark Applications as Filed** when requesting this service.

— 17 Calendar Day Service

$0.30 per page
$3.50 per certificate

Papers supplied are:

Face of file wrapper
Transmittal letter
Fee record sheet
Trademark application (including declaration, specimen and drawing)

The total number of pages in the trademark application as filed is multipied by $0.30. A $3.50 certification charge is added to the total page cost to arrive at the total cost for this service.

Uncertified copies of trademark application as filed can also be provided by the Certification Branch. The fulfillment time is the same. Only the $0.30 per page charge is incurred for uncertified copies of trademark applications as filed.

Trademark File Wrapper and Contents

These documents are also frequently called "file history," "file history of an application" and "prosecution file." Please refer to these documents as **Trademark File Wrapper and Contents** when requesting this service.

$0.30 per page
$3.50. per certificate

Papers supplied are:

Face of file wrapper
Transmittal letter
Fee record sheet
Trademark application (including declaration, specimen and drawing)
Papers in numerical order (per table of contents)
Table of contents

The total number of pages in the trademark file wrapper and contents is multiplied by $0.30. A $3.50 certification charge is added to the total page cost to arrive at the total cost for this service.

Uncertified copies of trademark file wrappers and contents can also be provided by the Certification Branch. Fulfillment times remain the same. Only the $0.30 per page charge is incurred for uncertified copies of trademark applications as filed.

Registered Trademarks

Certified copies of registered trademarks CANNOT be supplied by the Certification Branch. Requests for these copies (also known as "status copies") can be ordered from:

U.S. Patent and Trademark Office
Attn: Post Registration Section - Certification
Washington, D.C. 20231

Phone: (703) 308-0483

— 21 Calendar Day Regular Service
— 72 HOUR Expedited Service

$10 for regular service
$35 for expedited service

It should be noted that the above stated turnaround times for certified copies of registrations do not begin until the request is actually received in the Post Registration Section. In addition, any requests for expedited service received after noon are treated as if they were received on the next business day. No more than five (5) expedited requests are permitted per day per firm or party.

Regular, uncertified copies of registerd trademarks can be ordered through the PTO's normal copy fulfillment service:

U.S. Patent and Trademark Office
Box 9
Washington, D.C. 20231

Miscellaneous Documents

Certified copies of miscellaneous PTO records (such as sections of the MPEP, TMEP, 37 CFR, PTO letters, etc.) can be ordered from the Certification Branch.

Requests for these documents are provided as follows:

Patent related documents

— 25 Calendar Day Service at $10.00 per document

Trademark related documents

— 25 Calendar Day Service at $0.30 per page and $3.50 per certificate

Request for these types of services must identify the specific document or portion of the document requested.

In the past, certified copies of the Manual of Patent Examining Procedures have been provided by the Office of the Assistant Commissioner for Patents. The Certification Branch currently maintains a collection of the various editions and revisions of the Manual of Patent Examining Procedures (MPEP) on microfilm reels. Members of the public may request certified copies of chapters or sections of the various editions and revisions of the MPEP directly from the Certification Branch.

For the purpose of assessing fees, each chapter of the MPEP is considered to be one document. The fee for certification service is $10.00 for each chapter, or portion of a chapter ordered. The same chapter of two editions, or two revisions of the same chapter within the same edition, would be considered as two documents for fee accounting purposes. Examples: (1) A customer requests a certified copy of Chapter 100 from the 3rd Edition, Revision 2. The charge would be $10.00. (2) A customer requests a certified copy of Chapter 100, Section 100.1 from the original 2nd Edition. The charge would be $10.00. (3) A customer requests a certified copy of Chapter 100 from the 2nd Edition, Revision 1 and Chapter 200 from the original 3rd Edition. The charge would be $20.00.

Requests for certified copies of the MPEP may be sent via United States mail addressed to:

Commissioner of Patents and Trademarks
Box 10
Washington, D.C. 20231

or may be hand carried and placed at the Finance Cashier's Window or Public Service Window.

Requests must inlcude the Edition and Revision number from which the copy should be produced and specify the Chapter(s) or portions of the chapter(s) desired.

Customers may either request that their copies be mailed to a mailing address or be delivered to a Public Service Window box.

The turnaround time from receipt of the order at the Patent and Trademark Office to mailing of the certified copy is five working days.

Disclaimers

4,663,089.—*Jerry D. Lowry; Sylvia [redacted]. Lowry*, both of Thorndike, Me. DIFFUSED BUBBLE AERATION SYSTEM. Patent dated May 5, 1987. Disclaimer filed Jan. 7, 1991, by the inventors.

Hereby enters this disclaimer to claims 1-3, 5 and 8-13 of said patent.

4,718,153.—*Donald H. Armitage*, Grand Rapids; *Robert C. Angell*, Spring Lake, both of Mich. CUSHION MANUFACTURING PROCESS. Patent dated Jan. 12, 1988. Disclaimer filed Jan. 2, 1991, by the assignee, Steelcase, Inc.

Hereby enters this disclaimer to claim 36 of said patent.

4,731,938.—*Richard L. White*, Dallas, Tex. ANAEROBIC PASTEURIZING CONDITIONING SYSTEM. Patent dated Mar. 22, 1988. Disclaimer filed Mar. 12, 1990, by the assignee, VE Holding Corp.

The term of this patent subsequent to May 25, 2004, has been disclaimed.

4,790,922.—*Russel Huffer*, Owatonna, Minn. TEMPERABLE LOW EMISSIVITY AND REFLECTIVE WINDOWS. Patent dated Dec. 13, 1988. Disclaimer filed Feb. 4, 1991, by the assignee, Viracon, Inc.

Hereby enters this discliamer to claims 1 and 2 of said patent.

4,921,017.—*Atsushi Tada*, Tokyo, Japan. CHECK VALVE. Patent dated May 1, 1990. Disclaimer filed Dec. 20, 1990, by the inventor.

Hereby enters this disclaimer to claim 1 of said patent.

4,830,781.—*Richard W. Oswald*, Madison, Conn. TIRE BODY REINFORCING COMPONENT AND APPARATUS AND METHOD FOR PRODUCING SAME. Patent dated May 16, 1989. Disclaimer filed Feb. 20, 1991, by the assignee, Pirelli Armstrong Tire Corp.

Hereby enters this disclaimer to claims 1-7, 10-13, 15 and 16 of said patent.

4,962,729.—*Aurelio F. Barreto*, St. Hawthorne, Calif.; *Darrell R. Paxman*, Redmond, Wash. INSULATED SHELTER FOR PET ANIMALS AND METHOD OF MANUFACTURE THEREOF. Patent dated Oct. 16, 1990. Disclaimer filed Feb. 4, 1991, by the assignee, Dogloo, Inc.

Hereby enters this disclaimer to claims 1, 8, 9, 10, 11, and 14 of said patent.

4,993,097.—*Mark D'Amato*, Montreal, Canada. CIRCUIT BOARD DEBURRING SYSTEM. Patent dated Feb. 19, 1991. Disclaimer filed Dec. 10, 1990, by the assignee, D.E.M. Controls of Canada.

The term of this patent subsequent to Feb. 19, 2008, has been disclaimed.

Disclaimer and Dedications

4,698,262.—*Abraham Schwartz*, Durham; *Joel Williams*, Cary; *Robert D. Stevens*, Durham, all of N. C. FLUORESCENTLY LABELED MICROBEADS. Patent dated Oct. 6, 1987. Disclaimer and Dedication filed Feb. 14, 1991, by the assignee, Becton, Dickinson and Co.

Hereby disclaims and dedicates to the Public the remaining term of said patent.

4,871,789.—*Jeffrey Dormish*, Pittsburgh, Pa.; *Wolfgang Henning*, Kuerten, Fed. Rep. of Germany. PROCESS FOR THE PREPARATION OF AQUEOUS POLYURETHANE-POLYUREA DISPERSIONS. Patent dated Oct. 3, 1989. Disclaimer and Dedication filed Feb. 8, 1991, by the assignees, Bayer Aktiengesellschaft and Mobay Corp.

Hereby disclaims and dedicates to the Public the entire term of said patent.

SPECIAL BOXES FOR MAIL

Special PTO mail box numbers should be used to allow forwarding of particular types of mail to the appropriate areas as quickly as possible. Such mail is forwarded directly to the appropriate area without being opened. Only the specified type of document should be placed in an envelope addressed to one of these boxes. If any documents other than the specified type identified for each box are addressed to that box, they will be delayed in reaching the appropriate area for which they are intended.

The following special boxes should be used only for their specified purpose. Address mail as follows:

Box _____
Commissioner of Patents and Trademarks
Washington, D.C. 20231

Box 3	Mail for the Office of personel for NFC
Box 4	Mail for the Assistant Commissioner for External Affairs and the Office of Legislation and Internal Affairs.
Box 5	"No Fee" mail related to trademarks.
Box 6	Mail for the Office of Procurement
Box 7	Reissue applications for patents involved in litigation and subsequently filed related papers.
Box 8	All papers for the Office of the Solicitor *except* communications relating to *pending litigation*: papers relating to pending litigation shall be mailed only to Office of the Solicitor, P.O. Box 15667, Arlington, Va. 22215
Box 9	Coupon orders for U.S. patent and trademark copies.
Box 10	Orders for certified copies of patent and trademark applications.
Box 11	Electronic Ordering Service (EOS).
Box 12	Contributions to the Examiner Education Program.
Box 13	Mail for the Employee and Labor Relations Division.
Box 14	Invoices directed to the Office of Finance.
Box 15	Mail for the Advisory Commission on Patent Law Reform.
Box 171	Vacancy Announcement Applications.
Box AF	Expedited procedure for processing amendments and other responses after final rejection.
Box Assignment	All assignment documents except those filed with new applications.
Box DD	Mail related to Disclosure Documents.
Box EEO	Mail for the Office of Equal Employment Programs.
Box FWC	Requests for File Wrapper Continuation Applications (under 37 CFR 1.62)
Box Interference	Communications relating to interferences and applications and patents involved in interference.
Box Issue Fee	All Communications following the receipt of a PTOL-85, "Notice of Allowance and Issue Fee Due," and prior to the issuance of a patent should be addressed to Box Issue Fee, unless advised to the contrary. Assignments should be submitted in a separate envelope and not be sent to Box Issue Fee.
Box ITU	All intent to use documents, excluding the initial application and amendments to allege use.
Box M. Fee	Correspondence related to a patent that is subject to the payment of a maintenance fee.
Box Non-Fee-Amendment	Non-fee amendments to patent applications. (Use Box AF for responses after final rejection).
Box OED	Mail for the Office of Enrollment and Discipline
Box PATENT APPLICATION	New patent application and associated papers and fees.
Box TRADEMARK	New trademark application and associated papers and APPLICATION fees.
Box Pat. Ext.	Applications for patent term extension.
Box PCT	Mail related to applications filed under the Patent Cooperation Treaty.
Box Reexam	Requests for Reexamination for *original* request papers *only*.
Box Sequence	Submission of diskette for biotechnical application.
Box SN	For fee and petitions under 37 CFR 1.182 to obtain date received and/or serial number for patent applications *prior* to the Office's standard notification (return postcard or the official "Filing Receipt," "Notice to File Missing Parts," or "Notice of Incomplete Application").

Reference Collections of U.S. Patents Available for Public Use in Patent Depository Libraries

The following libraries, designated as Patent Depository Libraries (PDLs), receive current issues of U.S. Patents and maintain collections of earlier-issued patents. The scope of these collections varies from library to libary, ranging from patents of only recent years to all or most of the patents issued since 1790.

These patent collections, which are organized in patent number sequence, are available for use by the public free of charge. Each of the PDLs, in addition, offers supplemental reference publications of the U.S. Patent Classification System, including the *Manual of Classification, Index to the U.S. Patent Classification, Classification Definitions*, and provides technical staff assistance in their use to aid the public, in gaining effctive access to information contained in patents. CASSIS (Classification And Search Support Information System); which provides direct, on-line access to Patent and Trademark Office data, is available at all PDLs. Facilities for making paper copies of patents from either microfilm or paper collections are generally provided for a fee.

Since there are variations in the scope of patent collections among the PDLs and in their hours of service to the public, anyone contemplating use of the patents at a particular library is urged to contact that library, in advance, about its collection and hours in order to avert possible inconvenience.

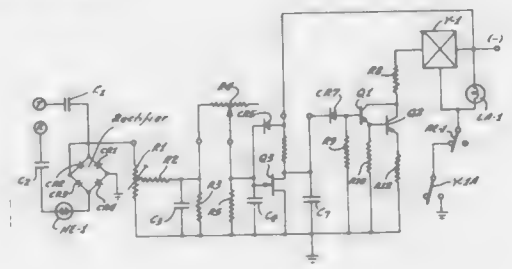
Expiration of patents: The patents within the range of numbers indicated below expire during March 1991 except those which may have had their terms curtailed by disclaimer under the provisions of 35 U.S.C. 253. Other patents, issued after the dates of the range of numbers indicated below, may have expired before the full term of 17 years for the same reasons, or have lapsed under the provisions of 35 U.S.C. 151.

Patents ..... Numbers 3,795,014 to 3,800,328 inclusive
Plant Patents ..... 3,501 to 3,534 inclusive



Matter enclosed in heavy brackets [ ] appears in the patent but forms no part of this reexamination specification; matter printed in italics indicates additions made by reexamination.

B1 3,723,656 (1454th)

TELEPHONE ANSWERING SYSTEM

Lawrence A. Curtis, Hunting Beach, and Elmer C. Bonsky, Long Beach, both of Calif., assignors to Virsonic Corporation

Reexamination Request No. 90/002,003, Apr. 18, 1990.
Reexamination Certificate for Patent No. 3,723,656, issued Mar. 27, 1973, Ser. No. 132,961, Apr. 12, 1971.
Int. Cl.[5] H04M *11/10*
U.S. Cl. 379—82

AS A RESULT OF REEXAMINATION, IT HAS BEEN DETERMINED THAT:

The patentability of claims 1 and 2 is confirmed.

1. In a telephone answering system which includes first circuitry for transmitting a recorded message over a telephone line in response to a ring signal, and a second circuitry for subsequently recording a message received over the telephone line from a calling party, the combination of:

means including a manually operated switch for activating and deactivating the system;

control circuit means coupled to the telephone line and responsive to incoming telephone ring signals for producing an output which rises above a particular threshold after a predetermined number of the aforesaid ring signals have been received;

relay means, connected to said control circuit means to be activated by said output therefrom, for electrically bypassing said switch when said output from said control circuit means rises above said predetermined threshold; and

holding circuit means, connected to said relay means, for maintaining said relay means in an activated condition until said telephone answering system enters a reset mode.

B1 4,044,187 (1455th)

FILM LAMINATES HAVING A REIRRADIATED LAYER

William P. Kremkau, Watkinsville, Ga., assignor to W. R. Grace & Co.

Reexamination Request No. 90/002,124, Sep. 5, 1990.
Reexamination Certificate for Patent No. 4,044,187, issued Aug. 23, 1977, Ser. No. 580,103, May 22, 1975.
Int. Cl.[5] B05D *3/06;* **B32B** *7/02, 27/08*
U.S. Cl. 428—212

AS A RESULT OF REEXAMINATION, IT HAS BEEN DETERMINED THAT:

The patentability of claims 2–13, 15 is confirmed.

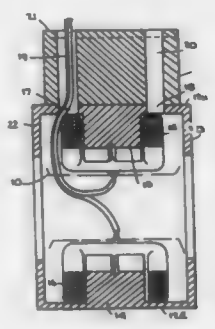
Claims 1, 14 are determined to be patentable as amended.

Claims 16–20, dependent on an amended claim, are determined to be patentable.

New claims 21–29 are added and determined to be patentable.

14. A polymeric film laminate comprising:

(*i*) *a relatively gas impermeable layer, and*



(*ii*) a plurality of cross-linked layers, at least one of said layers being cross-linked to a greater degree than any other cross-linked layer.

B1 4,420,982 (1456th)

UNITARY ELECTROMAGNETIC FLOWMETER WITH SEALED COILS

Roy F. Schmoock, Yardley, Pa., assignor to Fischer & Porter Company, Warminster, Pa.

Reexamination Request No. 90/001,443, Feb. 22, 1988.
Reexamination Certificate for Patent No. 4,420,982, issued Dec. 20, 1983, Ser. No. 398,809, Jul. 16, 1982.
Division of Ser. No. 174,609, Aug. 1, 1980, Pat. No. 4,358,963, which is a continuation-in-part of Ser. No. 75,037, Sep. 12, 1979, Pat. No. 4,253,340, which is a continuation-in-part of Ser. No. 811,276, Jun. 29, 1977, Pat. No. 4,181,018, which is a division of Ser. No. 771,420, Feb. 23, 1977, Pat. No. 4,098,118
Int. Cl.[5] G01F *1/58*
U.S. Cl. 73—861.12

AS A RESULT OF REEXAMINATION, IT HAS BEEN DETERMINED THAT:

Claims 1–6 are cancelled.

New claims 7, 8 are added and determined to be patentable.

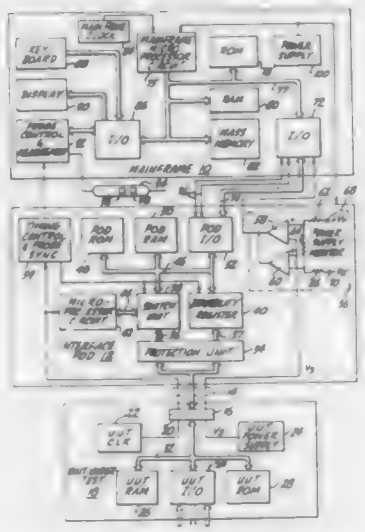
7. A flangeless electromagnetic flowmeter unit interposable between the end flanges of the upstream and downstream pipes of a line conducting a fluid whose flow rate is to be metered, the end flanges of the pipes having a predetermined diameter and a circle of bolt holes, said unit comprising:

A. a cylindrical housing having an external diameter which is smaller than that of the circle, the ends of the housing being engageable by the end flanges of the pipes, whereby when the unit is interposed between the end flanges of the pipes, the housing lies within the circle and the flanges are bridged by bolts passing through the holes to encage the unit and subject it to a compressive force effecting a fluid seal;

B. a non-magnetic spool coaxially disposed within said housing and provided with end flanges which are seated against the ends of the upstream and downstream pipes and define with said housing an internal cavity, said spool forming a fluid conduit having a longitudinal flow axis which joins the upstream and downstream pipes, said spool having a strength

sufficient to withstand the pressure of fluid flowing in the conduit and said compressive force;

C. a pair of electromagnet coils disposed at diametrically-opposed sides of said spool to create a magnetic field whose lines of flux extend across the conduit, said coils lying on a coil axis which is normal to said flow axis; and



D. a pair of electrodes mounted on said spool at diametrically-opposed positions along an electrode axis perpendicular both to the coil axis and to the flow axis whereby the fluid which flows through the conduit intersects said lines of flux to induce a signal in said electrodes which is a function of flow rate.

B1 4,455,654 (1457th)

TEST APPARATUS FOR ELECTRONIC ASSEMBLIES EMPLOYING A MICROPROCESSOR

Kasi S. Bhaskar, Edmonds; Alden J. Carlson, Bothell, both of Wash.; Alastair N. Couper, Honolulu, Hi.; Dennis L. Lambert, Bothell, and Marshall H. Scott, Woodinville, both of Wash., assignors to John Fluke Mfg. Co., Inc.

Reexamination Request No. 90/001,763, Apr. 26, 1989.
Reexamination Certificate for Patent No. 4,455,654, issued Jun. 19, 1984, Ser. No. 270,926, Jun. 5, 1981.
Int. Cl.[5] G06F *11/22*
U.S. Cl. 371—16.2

AS A RESULT OF REEXAMINATION, IT HAS BEEN DETERMINED THAT:

The patentability of claims **1–14**, **16** and **43–56** is confirmed.

Claims **15** and **29–42** are cancelled.

Claims **17–**[illegible] are determined to be patentable as amended.

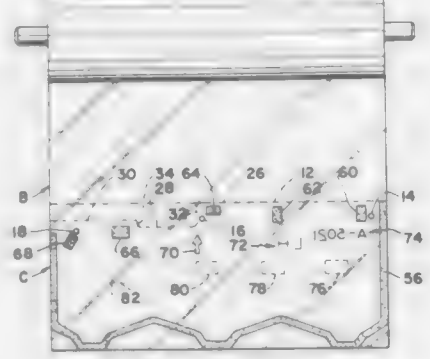
New Claims **57–111** are added and determined to be patentable.

1. A test system for functionally testing a microprocessor-based assembly of the type wherein a microprocessor circuit communicates with at least one of a random access memory unit, a read-only memory unit and an input/output register via an interconnection bus, and a clock circuit coupling a periodic clock signal to said microprocessor circuit to establish a bus cycle of a predetermined length, said test system comprising:

a second microprocessor circuit substantially identical to said microprocessor circuit of said microprocessor-based assembly being tested;

interconnection means for connecting said test system to said microprocessor-based assembly being tested with said test system being connected to replace said microprocessor circuit of said assembly being tested, said interconnection means including means for coupling said clock signal to said second microprocessor circuit;

memory means, including means for storing instructions and data for programming said second microprocessor circuit, for supplying addressing and data signals;



switching means for selectively coupling said second microprocessor circuit between a first operational state wherein said second microprocessor is in signal communication with said memory means and a second operational state wherein said second microprocessor circuit is in signal communication with said interconnection means to supply signals to and receive signals from said interconnection bus of said microprocessor-based assembly being tested, said switching means including timing means responsive to said clock signal supplied by said microprocessor-based assembly for switching said second microprocessor circuit into said second operational state at a predetermined time, said second microprocessor circuit being maintained in said second operational state for a single bus cycle each time said switching means switches said second microprocessor from said first operational state to said second operational state.

B1 4,604,302 (1458th)

METHOD OF MANUFACTURING WATER DEFLECTOR FOR VEHICLE DOORS

Robert A. Isaksen, Chardon; David E. Frappier, Mayfield Hts., and Wallace R. Jones, Waite Hill Village, all of Ohio, assignors to The Excello Specialty Company

Reexamination Request No. 90/001,529, Jun. 20, 1988.
Reexamination Certificate for Patent No. 4,604,302, issued Aug. 5, 1986, Ser. No. 612,414, May 21, 1984.
Division of Ser. No. 415,228, Sep. 7, 1982, Pat. No. 4,469,732
Int. Cl.[5] B32B *31/18*
U.S. Cl. 427—2[illegible].6

AS A RESULT OF REEXAMINATION, IT HAS BEEN DETERMINED THAT:

Claims **1–4** are cancelled.

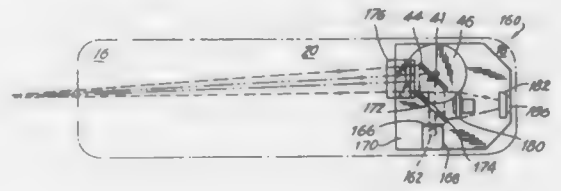
[1. A method of manufacturing water deflectors for application to the inner panels of vehicle doors comprising the steps of:

providing flat and flexible sheets of plastic material;

applying permanently plastic pressure sensitive adhesive to one face of each said sheet to cover a minor portion thereof in a pattern differnt from the peripheral shape of each said sheet and forming the outline of a desired configuration of a water deflector for application to the inner panel of a vehicle door;

curing said sheets for substantially permanently bonding said adhesive to said one face;

placing a plurality of said sheets on top of one another in a commonly oriented stacked relationship; and,



die cutting said stacked sheets generally along said desired configuration outwardly of said adhesive.**]**

B1 4,845,350 (1459th)

NARROW-BODIED, SINGLE- AND TWIN-WINDOWED PORTABLE LASER SCANNING HEAD FOR READING BAR CODE SYMBOLS

Howard M. Shepard, Great River; Edward D. Barkan, South Setauket, and Jerome Swartz, Stonybrook, all of N.Y., assignors to Symbol Technologies Inc., Bohemia, N.Y.

Reexamination Request No. 90/001,909, Dec. 14, 1989.
Reexamination Certificate for Patent No. 4,845,350, issued Jul. 4, 1989, Ser. No. 148,555, Jan. 26, 1988.
Division of Ser. No. 883,923, Jul. 10, 1986, Pat. No. 4,758,717, which is a division of Ser. No. 519,523, Aug. 1, 1983, Pat. No. 4,673,805, which is a division of Ser. No. 342,231, Jan. 25, 1982, Pat. No. 4,409,470
Int. Cl.[5] G06K *7/10*
U.S. Cl. 235—472

AS A RESULT OF REEXAMINATION, IT HAS BEEN DETERMINED THAT:

Claim **1** is determined to be patentable as amended.

New claims **2–5** are added and determined to be patentable.

1. In a scanning system for reading symbols, a hand-held, solid-state, retro-reflective laser scanning head comprising:

(a) means including a laser diode in the head for emitting an incident laser beam, and *a movable reflector in the head* for directing the incident laser beam *along a first optical path* on zones on **[**successive symbols**]** *a respective symbol* to be read, *said movable reflector directly receiving laser light of variable intensity reflected off the zones of the respective symbol along a second optical path, said paths extending along a straight line between the respective symbol and the reflector;*

(b) sensor means in the head and aimed at, and having a field of view on, **[**a**]** *the* respective symbol, said field of view overlapping a respective zone on the symbol being read;

(c) scanning means for *moving the reflector and for* simultaneously scanning a respective zone and the overlapping field of view across the respective symbol;

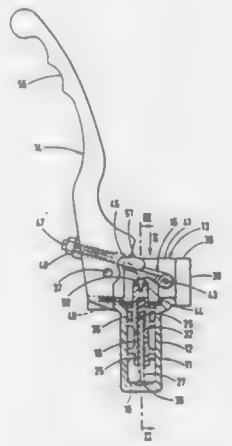
(d) said sensor means being operative, during scanning, for detecting *the* laser light of variable intensity reflected off the **[**zone of the respective symbol**]** *reflector*, and for generating an electrical signal which is indicative of the detected laser light intensity; and

(e) signal processing means in the head, for processing the electrical signal to generate therefrom data descriptive of the respective symbol being read.

Matter enclosed in heavy brackets [ ] appears in the original patent but forms no part of this reissue specification; matter printed in italics indicates additions made by reissue.

Re. 33,578

HYDRAULIC MASTER CYLINDER ASSEMBLY



Richard A. Bass, Leamington Spa, England, assignor to Automotive Products plc, Leamington Spa, England

Original No. 4,635,442, dated Jan. 13, 1987, Ser. No. 766,269, Aug. 16, 1985. Application for reissue Feb. 6, 1990, Ser. No. 475,993

Claims priority, application United Kingdom, Aug. 29, 1984, 8421830

Int. Cl.[5] **B60T** *7/02*

U.S. Cl. 60—554 **21 Claims**

1. A hydraulic master cylinder assembly comprising a hydraulic master cylinder and an actuating mechanism, the hydraulic master cylinder having a body member defining a bore therein and being adapted for attachment to part of a vehicle, a piston slideably supported in the bore, and an input member of the piston for co-operation with part of the actuating mechanism, the actuating mechanism having a driver operated actuating lever and an operative connection to connect the actuating lever to the input member said operative connection including *adjustable* means *including a single adjustable member* for *the selective* altering *of* the travel ratio between the actuating lever and the input member.

Re. 33,579

LITERATURE APPLYING MECHANISM

Helmut Voltmer, Park Ridge; Alfred F. Schwenzer, Totowa, and Edward J. Mazur, Montville, all of N.J., assignors to New Jersey Machine Inc., Fairfield, N.J.

Original No. 4,555,299, dated Nov. 26, 1985, Ser. No. 628,761, Jul. 9, 1984. Continuation-in-part of Ser. No. 542,731, Oct. 17, 1983, Pat. No. 4,502,910. Application for reissue Sep. 28, 1987, Ser. No. 101,643

Int. Cl.[5] **B65C** *6/40*

U.S. Cl. 156—552 **11 Claims**

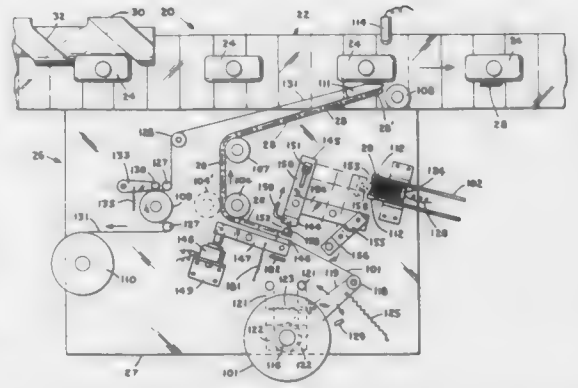
1. A system for applying literature to the sidewall of an object comprising:

means for pressing the literature against said sidewall:

[hopper] means for storing the literature;

a tape having an adhesive coating for carrying pieces of the literature from said [hopper] *storing* means to said pressing means;

means for moving said tape to said pressing means repetitively such that there are time intervals of advancement of the tape alternating with rest intervals during which said tape is stationary;



vacuum operated transporting means for transferring a piece of the literature from said [hopper] *storing* means to said tape during one of said rest intervals, said transporting means including suction cup means for engaging with a piece of the literature upon initiation of a vacuum, and for releasing the piece of literature upon termination of the vacuum;

vacuum means coupled to said suction cup means for applying a vacuum thereto and for terminating such vacuum;

a swing-arm assembly for carrying said suction cup means from said [hopper] *storing* means to the adhesive coating on said tape so as to permit engagement of said piece of literature with the adhesive coating;

a crank drive rotatably driven and connecting with said swing-arm assembly to impart motion thereto for transferring the literature; and

a vacuum valve driven by a shaft of said crank drive in synchronism with the operation of said swing-arm assembly, said vacuum valve initiating the vacuum and suction

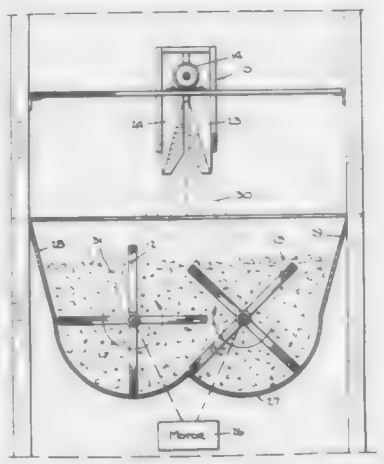
of the suction cup means at one position of said swing-arm assembly, said vacuum valve terminating the vacuum and the suction of the suction cup means at a second position of the swing-arm assembly; and said system further comprising

a pad disposed adjacent said second position of said suction cup means and on the opposite side of said tape from said suction cup means in said second position;

means for positioning said pad at the backside of said tape, said positioning means advancing said pad to said tape for restraining a transverse movement of said tape in response to pressure of said literature associated with the emplacement of said literature upon said adhesive coating by said transporting means, said positioning means retracting said pad from said tape upon a withdrawal of said suction cup means for said tape, thereby inhibiting any contact of said suction cup means with said adhesive coating; and

means for synchronizing the operation of said positioning means with movement of said crank drive, thereby to co-ordinate the positioning of said pad with the operation of said transporting means.

Re. 33,580



INFRARED DEHYDRATOR UNIT FOR MINCED FISH

Joseph Fraioli, 8 Seymour Pl., White Plains, N.Y. 10605

Original No. 4,781,933, dated Nov. 1, 1988, Ser. No. 95,027, Sep. 10, 1987. Continuation-in-part of Ser. No. 937,220, Dec. 3, 1986, Pat. No. 4,702,693. Application for reissue Oct. 10, 1989, Ser. No. 419,600

Int. Cl.[5] **A23L** *3/00;* **F26B** *3/00*

U.S. Cl. 426—242 **10 Claims**

7. The method of producing an edible fish product comprising the steps of:

A. mincing raw fish to produce small pieces thereof;

B. placing a load of the fish pieces in an open tank having side walls;

C. projecting into the tank a beam of infrared rays having a pattern which is directed mainly on the load and substantially avoids the side walls; and

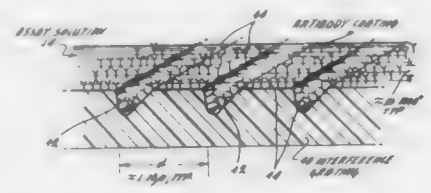
D. agitating the pieces in the tank to pick up the pieces in the load thereof and exposing them to the incident beam until such time as the pieces are dehydrated.

10. A dehydrator unit for a load of moist pieces, said unit comprising:

A. an infrared heater provided with a refractory body having a radiation horn from which is projected a diverging beam of infrared rays; and

B. a tank disposed in the path of the beam and adapted to contain a load of moist pieces to be dehydrated, said tank having side walls confining the load and provided with an agitator to pick up and expose all pieces of the load to the rays incident thereto to effect dehydration of these pieces, said beam having a radiation pattern which substantially confines the projected rays to the pieces and avoids striking said side walls, thereby preventing scorching and sticking of the agitated pieces when they make contact with the side walls.

Re. 33,581



IMMUNOASSAY USING OPTICAL INTERFERENCE DETECTION

David F. Nicoli, 448 Mills Way, Goleta, Calif. 93117, and Virgil B. Elings, 1155 Via Tranquilla, Santa Barbara, Calif. 93110

Original No. 4,647,544, dated Mar. 3, 1987, Ser. No. 624,460, Jun. 25, 1984. Application for reissue Jul. 13, 1987, Ser. No. 72,699

Int. Cl.[5] **C01N** *33/53*

U.S. Cl. 435—7.2 **40 Claims**

49. A flat immunoassay substrate having a uniform coating thereon, the uniform coating comprising an immunochemical optical interference pattern of microscopic dimensions of alternating areas of an active and deactivated member of a binding pair consisting of ligand and antiligand, the uniform coating having effectively uniform scattering properties and having a minimum scattering intensity at Bragg angles θ_B, the pattern of alternating areas forming an optical interference grating with a detectable scattering intensity at Bragg angles θ_x if the one member of the binding pair is bound to the other member of the binding pair.

PLANT PATENTS

GRANTED APRIL 30, 1991

Illustrations for plant patents are usually in color and therefore it is not practicable to reproduce the drawing.

7,508

ROSE PLANT JACCART

William A. Warriner, Tustin, Calif., assignor to Bear Creek Gardens, Inc., Medford, Oreg.

Filed Feb. 9, 1990, Ser. No. 478,194

Int. Cl.[5] **A01H** *5/00*

U.S. Cl. Plt.—7 **1 Claim**

1. A new and distinct variety of rose plant of the miniature class, substantially as herein shown and described, characterized particularly as to novelty by the unique combination of its ability to propagate easily from soft wood cuttings, near continuous bloom during the growing season, novel white edged with red blooms, resistance to disease and its dwarf but vigorous habit of growth.

7,509

ROSE PLANT KORBOLAK

Wilhelm Kordes, Sparrieshoop, Fed. Rep. of Germany, assignor to Bear Creek Gardens, Inc., Medford, Oreg.

Filed Feb. 6, 1990, Ser. No. 475,955

Int. Cl.[5] **A01H** *5/00*

U.S. Cl. Plt.—18 **1 Claim**

1. A new and distinct variety of rose plant of the hybrid tea class, substantially as herein shown and described, characterized particularly as to novelty by its exceptionally high yield of long stemmed roses, its large flower size, its very long vase life, and its healthy disease resistant foliage.

7,510

ROSE PLANT KORXENNA

Wilhelm Kordes, Sparrieshoop, Fed. Rep. of Germany, assignor to Bear Creek Gardens, Inc., Medford, Oreg.

Filed Feb. 6, 1990, Ser. No. 475,976

Int. Cl.[5] **A01H** *5/00*

U.S. Cl. Plt.—21 **1 Claim**

1. A new and distinct variety of rose plant of the hybrid tea class, substantially as herein shown and described, characterized particularly as to novelty by its strong disesase resistant foliage, long stems, high yield of cut stems, large bright red flowers and five (5) to seven (7) leaflet leaves.

7,511

CHRYSANTHEMUM PLANT NAMED DARK YELLOW FINA

Cornelis P. VandenBerg, Salinas, Calif., assignor to Yoder Brothers, Inc., Barberton, Ohio

Filed Nov. 14, 1989, Ser. No. 435,823

Int. Cl.[5] **A01H** *5/00*

U.S. Cl. Plt.—74 **1 Claim**

1. A new and distinct Chrysanthemum plant named Dark Yellow Fina, as described and illustrated.

7,512

CHRYSANTHEMUM PLANT NAMED DONNA

Cornelis P. VandenBerg, Salinas, Calif., assignor to Yoder Brothers, Inc., Barberton, Ohio

Filed Dec. 29, 1989, Ser. No. 458,836

Int. Cl.[5] **A01H** *5/00*

U.S. Cl. Plt.—74 **1 Claim**

1. A new and distinct Chrysanthemum plant named Donna, as described and illustrated.

7,513

CHRYSANTHEMUM PLANT NAMED NAOMI

Cornelis P. VandenBerg, Salinas, Calif., assignor to Yoder Brothers, Inc., Barberton, Ohio

Filed Dec. 29, 1989, Ser. No. 458,837

Int. Cl.[5] **A01H** *5/00*

U.S. Cl. Plt.—74 **1 Claim**

1. A new and distinct Chrysanthemum plant named Naomi, as described and illustrated.

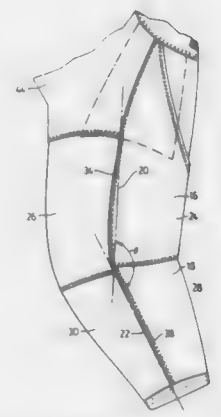
GENERAL AND MECHANICAL

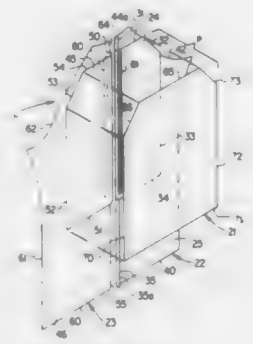
5,010,589
CLOTHING WITH IMPROVED CAMOUFLAGE
Douglas N. Hamilton, 12211 Rainbow Ave., Anchorage, Ak. 99516
Filed Jan. 25, 1989, Ser. No. 301,1[illegible]
Int. Cl.[5] A41D *13/00*
U.S. Cl. 2—1 **11 Claims**



1. In combination:
a piece of clothing including camouflage means for providing camouflage for the wearer of the clothing,
removable fringe which may be attached to, and detached from, said clothing, said fringe comprising a multiplicity of elongated elements held by said clothing with a first end of each element adjacent said clothing and the other end hanging vertically from said clothing, and
supporting means for removable attachment to said clothing, said supporting means supporting said first-ends of said elements,
wherein said supporting means is a sheet of material and said elements are positioned along at least one face of said sheet.

5,010,590
VISOR-CAP
William Haber, 5812 Donna Ave., Tarzana, Calif. 91356, and Jack Takeshita, 12816 Montague St., Pacoima, Calif. 91331
Filed Jun. 2, 1989, Ser. No. 360,419
Int. Cl.[5] A61F *9/00*
U.S. Cl. 2—12 **8 Claims**

1. A fully rectangular sheet of a single type of die-cut material suitable for use as a place mat, for forming a visor-cap comprising:
a fully rectangular blank of a single type of material having two longer sides and two shorter sides;
a unitary die-cut portion of said rectangular blank having a bill extending generally along one of said shorter sides, two straps affixed to opposite sides of said bill and extending generally along said longer sides to points adjacent the other shorter side and including mating joining means, and
a crown portion formed between said straps and extending to first and second points at opposite sides of said bill; and
first and second structural fold lines extending between said first and second points, the first of said fold lines extending substantially directly between said two points, and the second of said fold lines being curved toward the forward end of said bill;
whereby said sheet may be initially used as a place mat or the like, and then said die-cut portion may be separated from said rectangular blank, and said crown and said bill may be formed into a visor-cap by folding at said two fold lines and securing said straps together by said joining means.



5,010,591
FIRE FIGHTER'S COAT HAVING IMPROVED SLEEVE CONSTRUCTION
Shaik M. Kalaam, Scarborough, Canada, assignor to Safeco Mfg. Limited, Scarborough, Canada
Filed Apr. 2, 1990, Ser. No. 502,635
Int. Cl.[5] A41D *3/02*
U.S. Cl. 2—93 **3 Claims**

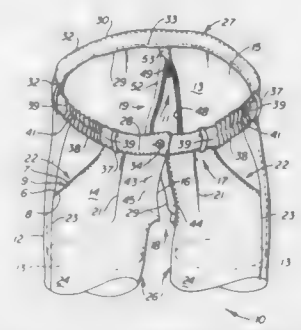
1. A fire fighter's coat comprising:
a main body portion and a pair of sleeves each made from a tough, thermally insulated fabric which has a degree of flexibility which is substantially less than that of conventional street clothing; said sleeves each having an upper arm portion which has a sleeve passage opening therethrough which has a first axis which extends longitudinally thereof and a forearm portion which has a forearm passage opening therethrough which has a second axis which extends longitudinally thereof, said forearm portion being attached to the upper arm portion in such a manner that said second axis is inclined forwardly with respect to the upper arm portion when the sleeve is in a relaxed position, thereby to provide a natural forward set to the sleeve which serves to substantially reduce the resistance offered by the sleeve to movement of the fire fighter's arms to a position required to enable the wearer to bring his hands together to grasp an object located in front of the coat, the upper sleeve portion and the forearm portion of each sleeve having a front panel and a back panel, the front and back panels of the upper portion being secured to one another along first seam lines which extend longitudinally thereof and the front and back portions of the forearm portion being secured to one another along second seam lines which extend longitudinally thereof, the front panel of the upper portion being secured to the front panel of the forearm portion along a third seam line and the back panel of the upper portion being secured to the back panel of the forearm portion along a fourth seam line,

said third and fourth seam lines being angularly inclined with respect to one another to provide the angular inclination of the forearm portion with respect to the upper portion.

5,010,592
SELF-STORING COAT
John R. Skiles, Jr., Dallas, Tex., assignor to Ol'Sonora Trading Company Inc., Sonora, Tex.
Filed May 19, 1989, Ser. No. 354,638
Int. Cl.[5] A41D *3/00, 15/00*
U.S. Cl. 2—93 **7 Claims**

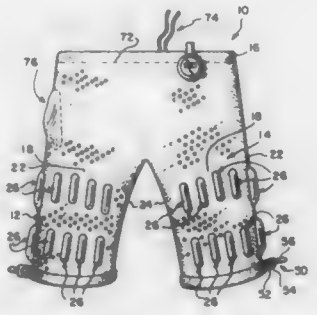
1. A self-storing coat comprising:
a coat body;
a lining in said coat body including back panel portions along an inside back of said coat body;
a storage pocket attached with said lining back panel portions between said back panel portions and said coat body along a central portion of said back of said coat;
means along said lining back panel portions defining a vertical opening into said storage pocket extending along a back center line of said coat substantially the length of said storage pocket from the vicinity of the collar end of said coat toward the skirt end of said coat; and
fastening means on said lining back panel portions along said opening for releasably securing said opening closed during wearing of said coat and during a storage mode of said coat when said coat and lining are folded into said storage pocket.

5,010,593
DECORATIVE NECKTIE KNOT COVER
Carl T. Stevens, Jr., 7411 E. Montecito Dr., Tucson, Ariz. 85710
Continuation-in-part of Ser. No. 422,238, Oct. 16, 1989. This application Aug. 23, 1990, Ser. No. 571,290
Int. Cl.[5] A41D *25/02, 25/14*
U.S. Cl. 2—152 R **18 Claims**



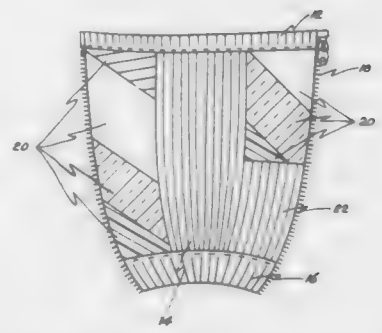
1. A decorative cover for the knot of a necktie being worn by a person comprising:
a front face adapted to receive decoration;
at least one side panel operably attached to said front face;
a top panel operably attached to said front face;
a rear panel spaced apart and parallel to said front face, said rear panel operably attached to said top panel, said front face, side panel, top panel, and rear panel each contributing to form the walls of a cavity to encompass the knot, said front face, side panel, top panel, and rear panel also contributing to form a plurality of openings between the panels into the cavity to allow entrance of the tie into the cavity and its exit therefrom;
a protruding tab operably attached to said side panel, said protruding tab also defining in part the cavity encompassing the knot; and
fastening means securing said protruding tab to said back panel to secure and define the cavity encompassing the necktie knot whereby the decorative cover is secured about the necktie knot against inadvertent removal.

5,010,594
DAMPENING MASK FOR USE IN AIRCRAFT
Shigeaki Suzuki, Yokohama, and Hideo Inoue, Tokyo, both of Japan, assignors to Japan Air Lines Co., Ltd., Tokyo, Japan
Filed Jun. 27, 1989, Ser. No. 371,971
Int. Cl.[5] A62B *18/02*
U.S. Cl. 2—206 **8 Claims**



1. A dampening mask for dampening dry air of an environment to be respired by a wearer of the mask, said mask comprising:
a mask body of a size adapted to fit over at least the nose of a wearer and of a shape adapted to form a small space therein in front of the nose of a wearer that is separated by the mask body from the environment outside of the mask body; and
a ventilation-passage member extending through said mask body from a location in front of the nose of a wearer when the mask body is fitted thereover,
said ventilation-passage member comrpising a honeycomb structure of moisture absorbing material defining a plurality of tubular cavities through which air can pass between said space and the environment outside of the mask body when the mask body is fitted over at least the nose of the wearer, said moisture absorbing material being Japanese paper comprising bast fibers, and
said Japanese paper capable of absorbing moisture in dampened air passing through said cavities and capable of releasing moisture absorbed thereby to dry air passing through said cavities, whereby when the mask is worn in an envioronment of dry air, respiration through said ventilation-passage member causes moisture in air being exhaled to be absorbed by said Japanese paper and causes moisture absorbed by said Japanese paper to be released to air being inhaled.

5,010,595
SEPARABLE PANTS WITH INTEGRAL UNDERPANTS
Carolyn A. Stradley, P.O. Box 1155, Marietta, Ga. 30061
Filed Mar. 26, 1990, Ser. No. 498,770
Int. Cl.[5] A41D *1/06, 13/02*
U.S. Cl. 2—227 **13 Claims**

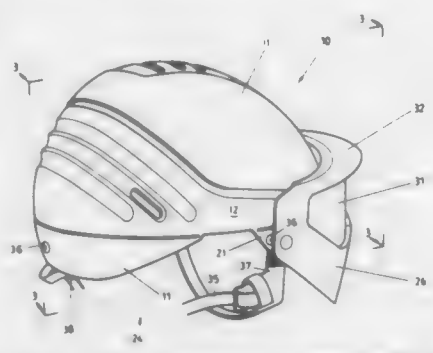


1. A woman's garment constructed of fabric comprising:
outer pants having front, side, and rear portions and a waist band with leg portions depending therefrom separate from one another to form a crotch portion in said outer pants;
an inner lining affixed to the interior of said outer pants about the waist band of said outer pants and conforming to the shape of the interior of said outer pants;
a releasable seam having opposed side edges within the fabric of said outer pants extending from immediately below the waist band at the rear portion of said outer pants and downwardly through the crotch portion and upwardly toward the front portion of said outer pants;
a seam having opposed side edges within the fabric of said inner lining;
the side edges of the seam of said inner lining being attached to the corresponding side edges of the releasable seam of said outer pants for creating a single releasable opening within said outer pants and said inner lining to expose the buttocks and crotch of the wearer; and
said releasable opening extending from immediately below said waistband at the rear portion of said outer pants downwardly through said crotch portion of said outer pants and upwardly toward the front portion of said outer pants immediately below said waistband.

5,010,596
CONFORMABLE WEIGHTED CONDITIONING GARMENT
Darryl L. Brown, 349 E. Piru St., Los Angeles, Calif. 90061, and Terence Kirkpatrick, 15910 N. Bend Ct., Houston, Tex. 77073
Filed Jun. 25, 1990, Ser. No. 542,820
Int. Cl.[5] A41D *1/08, 1/06;* **A63B** *21/00*
U.S. Cl. 2—228 **10 Claims**

1. A garment for physical conditioning comprising a pair of leg and thigh sections constructed of a flexible, stretchable material for encompassing and hugging the thighs of a wearer wherein each of said leg sections is formed with a plurality of pouches spaced laterally apart adjacent the thighs of a wearer and a plurality of weights disposed separately in at least some of said pouches and being immobilized therewithin.

5,010,597
GAITER FOR BICYCLING
Chris A. Glover, 4 Allison St., Concord, N.H. 03301
Filed Aug. 13, 1990, Ser. No. 566,569
Int. Cl.[5] A41B *11/00;* **A41D** *17/02*
U.S. Cl. 2—242 **10 Claims**



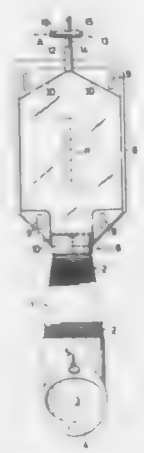
1. A gaiter for protecting slacks or trousers of a bicyclist from contacting the chain of the bicycle comprising:
a cuff panel of a stretchable material, having top and side edges, adapted to fit snugly around the ankle of the bicyclist to position the slacks or trousers comfortably close to the bicyclist ankle;
a protective panel having bottom and side edges with the bottom edge of said protective panel fastened to the top edge of said cuff panel, said protective panel being a stretchable material sized to substantially cover the inside lower leg of the wearer when tensioned around the lower leg of the bicyclist;
a support panel having top, bottom and side edges, sized to substantially cover the outside lower leg of the wearer with the top edge being greater than the bottom edge to correspond to the differences in the bicyclist's leg circumference from below the knee down to the ankle and sized to cause said protective panel to be tensioned around the bicyclist leg keeping said gaiter comfortably in place during the flexion of the bicyclist's lower leg, said support panel having side edges attached to the side edges of said protective panel;
fastener means, attached adjacent to a mid point between side edges of said cuff panel and the side edges of said protective panel, for releasable joining said gaiter to the lower leg of said bicyclist;
pocket panel, substantially rectangular in shape, attached to the lower portion of said support panel along three sides to form a pocket open at the top, adapted to hold the bicyclist's small items while bicycling

---

5,010,598
SAFETY HELMET
David P. Flynn, and John E. Oretti, both of Blackburn, Australia, assignors to Britax Child-Care Products Pty. Ltd., Victoria, Australia
Filed Feb. 2, 1990, Ser. No. 473,904
Int. Cl.[5] A42B *1/06*
U.S. Cl. 2—410 **9 Claims**

1. A safety helmet comprising:
a main body of a shape to entirely overlie the head of a wearer,
an overbody,
means for securing the overbody to extend over a portion of the main body,
spacer ribs between the overbody and the main body separating said bodies and thereby maintaining an air space therebetween,

an inner body,
means for securing the inner body within the main body,
vent surfaces extending through both the inner body and the main body defining primary vents opening upwardly therefrom to said air space, and
further vent surfaces in the overbody defining secondary vents opening upwardly from the overbody,



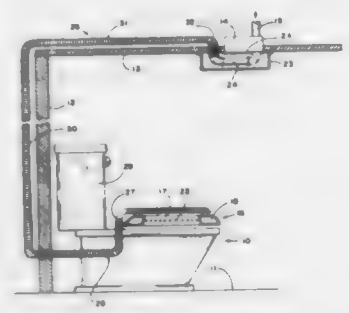
the configuration being such that air located within the inner body is heated by a wearer of the helmet and moves upwardly through the primary vents into said air space by convection, and air within said air space having a higher air temperature than environmental air temperature moves upwardly and outwardly therefrom through the secondary vents by convection.

5,010,5[illegible]

PORTABLE UNISEX URINAL

Leif Nilsson, Blåbärsvägen 1, S-260 40 Viken, Sweden

Filed Dec. 18, 1987, Ser. No. 134,942
Claims priority, application Sweden, Mar. 30, 1987, 8701299
Int. Cl.[5] A61G *9/00*
U.S. Cl. 4—144.2 **9 Claims**



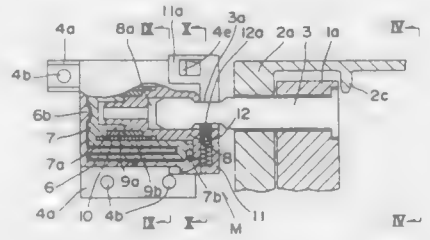
1. A disposable device for collecting and temporarily storing urine of an individual of either sex, said device comprising a combination of:
(a) a urine tube which has first and second openings, of which the first opening forms a urine inlet end of said tube and the second opening serves as a urine outlet, wherein the first opening is larger than the second opening, and wherein the tube has provided at a location along its length means which enable the tube to be bent plastically to a desired curved configuration;
(b) a urine collecting bag which is made of a flexible material and which has an inlet end and an openable outlet end, said bag having a bottom portion which converges in a direction towards the outlet opening;
(c) a valve means which includes a valve body which in longitudinal section is of U-shape, a proximal end which communicates with the urine tube, and a distal end which communicates with the urine collecting bag, wherein the distal end of the valve body is embraced by the upper open end of the bag to establish communication between the valve means and said bag, wherein the valve means together with the urine collecting bag form a unit, wherein the outer surface of the distal end of the valve body lies sealingly against the inner wall of the urine tube in the region of its second opening, wherein the distal end of the valve body is fitted with a liquid and vapor impermeable diaphragm which deflects downwardly under the influence of liquid pressure directed towards the bag to permit liquid to flow into the bag, wherein the distal end of the valve body has arranged therein a perforated bottom against the undersurface of which the diaphragm seats in normal use of the device, perforations in said bottom being conically tapered and the diaphragm being sufficiently resilient to return the diaphragm to position sealingly against said perforations after liquid passes to seal the valve body against back-flow of liquid, gas, odor, or bacteria and wherein seating of the diaphragm on said bottom is guided by a centrally located guide means that holds the center of the diaphragm substantially in the center of the perforations; and
(d) a lid to close the first closable opening of urine tube (a).

5,010,600

TOILET ODOR REMOVAL SYSTEM

Anthony Prisco, 3600 Redwood St., Las Vegas, Nev. 89103

Filed Feb. 16, 1990, Ser. No. 481,344
Int. Cl.[5] E03D *9/05*
U.S. Cl. 4—217 **2 Claims**



1. A kit for enhancing the withdrawal of noxious vapors from a bathroom having an existing exhaust fan contained in a housing vented to the atmosphere, the housing having a large air intake opening in the bathroom, the kit including:
(a) a generally annular toilet seat having a central opening and a peripheral conduit that extends internally around the seat and terminates at the rear end of the seat in an exhaust outlet;
and a plurality of laterally extending apertures that communicate the peripheral conduit with the central opening of the toilet seat;
(b) a cover assembly including means for reducing the area of the existing housing air intake opening to a restricted vapor intake aperture;
(c) an exhaust duct for connection at one of its ends to the toilet seat conduit exhaust outlet,
the exhaust duct being of sufficient length to extend from its connection to the toilet seat conduit exhaust outlet to the restricted vapor intake aperture in the cover assembly; and
(d) said cover assembly further including:
(i) a cover plate having a restricted vapor intake aperture therein,
the cover plate being adapted to be mounted over the air intake of the existing fan housing, and
(ii) a cover box that covers the cover plate and the end of the exhaust duct attached to the cover plate at the restricted vapor intake aperture;
whereby the exhaust fan can be operated to draw noxious vapors from the toilet seat through the exhaust duct and the restricted vapor intake aperture into the fan housing for discharge to the atmosphere.

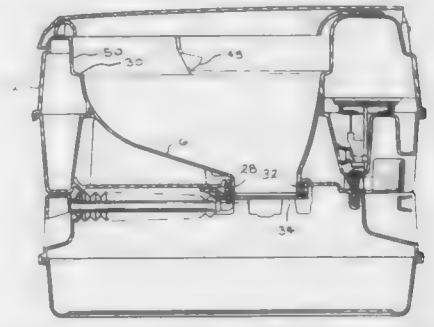
5,010,601

MECHANISM FOR OPENING AND CLOSING TOILET SEAT AND COVER

Keiichi Kobayashi; Masazumi Moriwaki, both of Kitakyushu; Sigenari Kadomatsu, Yokohama; Yuji Fujie, Yokohama, and Masanobu Kawamoto, Yokohama, all of Japan, assignors to Toto Ltd., Fukuoka and Nifco Inc., Kanagawa, both of, Japan

Continuation-in-part of Ser. No. 300,470, Jan. 23, 1989, abandoned. This application Jul. 26, 1990, Ser. No. 560,267
Claims priority, application Japan, Jan. 26, 1988, 63-16149
Int. Cl.[5] A47K *13/12, 13/10*
U.S. Cl. 4—236 **23 Claims**

1. Apparatus for controlling pivotal movement of a pivotal member on a water closet comprising casing means mounted on said water closet, a rotor means rotatably mounted in said casing means, viscous material means interposed between said rotor means and said casing means providing relative rotational resistance between said rotor means and said casing means, a joint means coaxial with said rotor means, spring clutch means operably disposed between said rotor means and said joint means and operable to drive said rotor means in one direction when said joint means is rotated in one direction while permitting said joint means to rotate in an opposite direction without driving said rotor means in said opposite direction, shaft means connected to said pivotal member, said shaft means being coaxial with said joint means, and interplay means interposed between said shaft means and said joint means operable to permit said shaft means to rotate an angular amount in said one direction without driving said joint means and operable such that when said shaft means continues to rotate further beyond said angular amount in said one direction, said shaft means drives said joint means, whereby said pivot member attached to said shaft means is freely rotatable in said one direction said angular amount and thence further rotatable in said one direction to a closed position while being restrained by said viscous material means, said pivot member being rotatable in said opposite direction from said closed position to an open position without being restrained by said viscous material means.



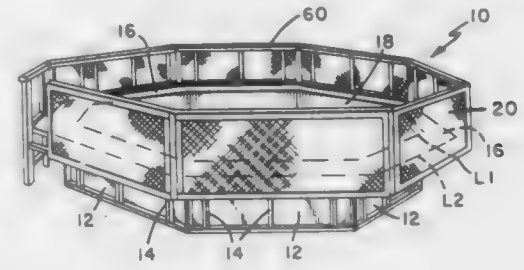
5,010,602

TOILET WITH PULSED FLOW OF FLUSH WATER

Charles L. Sargent; John M. Antos, and Scott I. Biba, all of Ann Arbor, Mich., assignors to Thetford Corporation, Ann Arbor, Mich.

Continuation of Ser. No. 471,710, Jan. 29, 1990, abandoned, which is a continuation of Ser. No. 309,776, Feb. 10, 1989, abandoned, which is a division of Ser. No. 114,081, Oct. 27, 1987, abandoned. This applicatiou Jul. 13, 1990, Ser. No. 553,353
Int. Cl.[5] E03D *11/00*
U.S. Cl. 4—432 **2 Claims**

2. In a toilet which includes a seat section having a bowl with a bottom discharge opening and a flush water discharge means for discharging flush water into said bowl for flushing waste in said bowl through said discharge opening, said bowl having a generally horizontal ledge at the upper end thereof, said discharge means being operable of discharge flush water in a generally horizontal direction onto said ledge so that it will travel around the periphery of said bowl on said ledge, and means for operating said discharge means intermittently so that



pulses of flush water can be discharged onto said ledge, said water in each pulse initially moving onto said ledge at a high velocity and as the water moving on the ledge loses it momentum, and as the velocity of the water decreases, the centrifugal force of the water that is holding it on the ledge decresed and the water gradually runs off said ledge around substantially the entire periphery of said bowl to uniformly wet said bowl.

5,010,603

MODULAR ABOVE GROUND SWIMMING POOL

Lewis R. Hertzog, 167 N. Bingaman St., Reading, Pa. 19606

Filed Jan. 11, 1990, Ser. No. 463,568
Int. Cl.[5] E04H *4/00;* **E02D** *00/00*
U.S. Cl. 4—506 **7 Claims**

1. An above ground swimming pool comprising a plurality of modular components each of which is prefabricated and ready for assembly in combination at the construction site each including:
(a) a modular wall panel formed integrally with a rearwardly extending flange
(i) at each of the sides of the panel for securing a contiguous panel through said flange to a contiguous panel to form a continuous swimming pool perimeter wall and
(ii) at the top and at the bottom of each modular panel, said top flange and bottom flange being provided further with a brace-end confining lip or second flange extending from the end of each of said top and bottom flange and toward the opposite flange and in a direction substantially parellel to the said panel wall;
(b) a unitary modular brace for supporting each of a swimming pool wall, a deck at the top of said wall at the periphery of the swimming pool and a protective fence positioned above the swimming pool wall and comprised of four linear pieces of cut standard construction lumber and locked in a modular configuration and including
(i) a first vertical piece whose top and bottom ends are inserted, respectively, in the said top and bottom wall

panel flanges to brace the swimming pool wall panel at the backside of the panel,

(ii) a deck supporting piece secured to and near the top of said first vertical piece and extending horizotally rearwardly from said first vertical piece and secured at its opposite end to

(iii) a second vertical piece which extends upward from a horizontal deck supporting piece, said horizontal piece being located at a point below the top of said first vertical piece a distance substantially equal to the width of said standard lumber and such that a deck receiving recess is provided on the horizontal piece between said first and second vertical pieces, and

(iv) a diagonal piece to secured at its lower end on the lower part of said first vertical piece and at its upper end at the juncture of the said horizontal deck supporting piece and the lower end of said second vertical piece;

(c) a preformed modular deck complimentally configured to and received in said recess between said first and second vertical pieces and resting on said horizontal piece, and

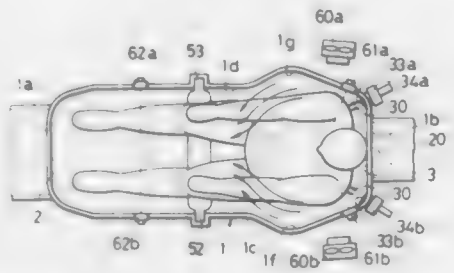
(d) a screen or fence secured on said second vertical piece and providing an enclosure at the top of and surrounding the the swimming pool wall.

5,010,604

AUTOMATIC HAIR AND SCALP TREATMENT APPARATUS FOR CONTACTING THE SCALP BEHIND THE EARS

Archie M. Miller, Brentwood, Tenn., assignor to IHT, Inc., North Nashville, Tenn.

Filed Apr. 5, 1990, Ser. No. 504,846
Int. Cl.[5] A45D *19/10*
U.S. Cl. 4—519 **3 Claims**



1. In the apparatus for use in applying hair and scalp treating solutions to the human head, which includes a bowl, a closure therefor adapted to enclose the head with the face outside the closure and the back of the neck on the bowl front, an arcuate header including upper and lower spray manifolds adapted to oscillate in an arc from a point opposite the forehead to a point opposite the neck, means imparting partial rotation to the arcuate header to effect said oscillatory movement, a plurality of nozzles disposed on each manifold to dispense adjacent pressurized sprays of treating solutions, means enabling spray from the manifolds to contact an area behind one's ears wherein at least one nozzle is disposed on each manifold opposite an ear so that spray therefrom reaches the ear, wherein the said at least one nozzle on the lower manifold is so disposed that it is inclined away from the upper manifold at an angle of inclination with respect to the plane in which the lower arcuate manifold lies, wherein the said at least one nozzle on the upper manifold is so disposed that it is inclined away from the lower manifold at an angle of inclination with respect to the plane in which the upper arcuate manifold lies, wherein the nozzles on each manifold are adapted to dispense fan sprays in a plane perpendicular to the plane through that manifold, and wherein the axis of the circle which the oscillatory arc would inscribe is offset from the ear, being positioned below the ear toward the top of the head so that the curve inscribed around the ear by spray from the inclined nozzles is the involute of a circle such that spray from the inclined nozzles contacs the scalp behind the ears.

BODY MASSAGING APPARATUS OF WATER CURRENT TYPE

Toshio Shiina, Kawasaki; Keiko Miyamoto, Yokohama; Kouji Izumi, Yokohama; Yasuro Hayashi, Yokohama; Yonenobu Karasawa, Numazu; Satoru Uematsu, Numazu, and Naoki Sei, Numazu, all of Japan, assignors to Ricoh Company, Ltd., Tokyo, Japan

Filed Apr. 10, 1989, Ser. No. 335,734
Claims priority, application Japan, Apr. 13, 1988, 63-90814; Apr. 13, 1988, 63-90815; Jan. 24, 1989, 1-14800
Int. Cl.[5] A61H *33/02*
U.S. Cl. 4—542 **12 Claims**

8. Apparatus comprising:

an elongated tub having a water inlet and a water outlet, said tub containing water in which a patient's body can be immersed with the long axis of the body extending generally along the length of the tub and with the patient's head adjacent the water inlet and the patient's feet adjacent the water outlet;

a circulating conduit extending outside the tub and connecting the inlet and outlet to circulate water from the outlet into the inlet;

main flow means for selectively introducing into said tub, through said water inlet, a substantially uniform water flow which substantially surrounds the patient while flowing through the tub and generates vortices at least at the abdominal area of the patient and exits the tub through said water outlet;

jet flow means for selectively introducing into said tub at least one pulsed flow of water impinging on at least one selected area of the patient's body; and

control means controlling the main flow means and the jet flow means to turn on and turn off said uniform water flow and said pulsed flow at selected times to subject the patient to the pulsed flow during one time interval and to at least the uniform flow during another time interval.

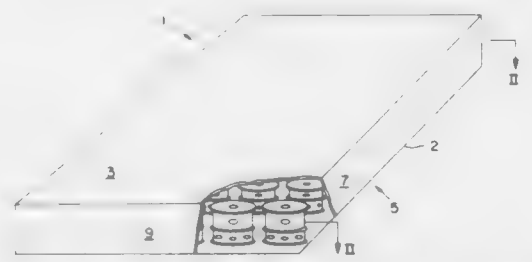
BATH SEAT

Michael S. Bernstein, Natick, Mass.; David W. Crossley, Woonsocket, R.I., and Michael I. Lerner, Brookline, Mass., assignors to Safety 1st, Inc., Chestnut Hill, Mass.

Filed Feb. 27, 1990, Ser. No. 485,619
Int. Cl.[5] A47K *3/024*
U.S. Cl. 4—572 **23 Claims**

1. A bath seat comprising a base, intermediate and top portions, said intermediate portion being substantially planar and disposed proximate and superimposed over said base, said top portion including a generally circular enclosed frame having backrest, side arm and front sections, cooperating means between said base portion and intermediate portion to secure said intermediate and said base portions together and enabling rotational motion therebetween, a seat integrally formed in said intermediate portion and substantially in the plane with said cooperating means, and support means for supporting said top portion in a spaced-apart relationship with said intermediate portion, said support means including apertures that allow



legs of a person using the seat to extend outwardly beyond an outer edge of the intermediate portion.

5,010,607

DAMPING CHAMBER FOR WATERBED MATTRESS

Robert A. Sobie, #410-31 Reliance Court, New Westminster, B.C., Canada V3H 6C6

Filed Jan. 25, 1990, Ser. No. 470,901
Claims priority, application Canada, Jan. 2, 1990, 2006972
Int. Cl.[5] A47C *27/08*
U.S. Cl. 5—450 **8 Claims**

1. A damping baffle for a waterbed mattress wherein said mattress comprises a top wall, bottom wall and side walls connecting said top and bottom walls and thereby forming a liquid-retaining envelope, said baffle having an interior and an exterior and comprising:

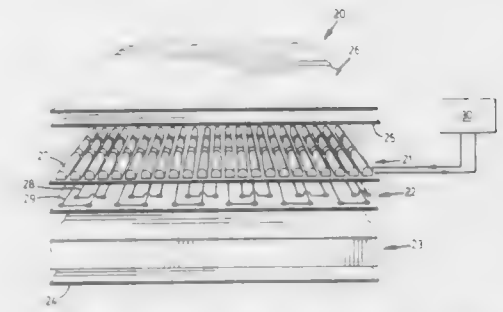
(a) a first chamber having a vertical side wall, said side wall having a lower edge and an upper edge, a top panel fixed to said upper edge of said side wall and a bottom panel fixed to said lower edge of said side wall, said side wall, top panel and bottom panel thereby separating the interior of said chamber from the exterior of said chamber;

(b) a second chamber connected to said bottom panel off said first chamber, said second chamber having a vertical side wall having a lower edge and an upper edge, said upper edge of said side wall being fixed to said bottom panel of said first chamber and said lower edge of said side wall being fixed to said bottom wall of said waterbed mattress; and

(c) flotation means adjacent said top panel of said first chamber;

wherein said top panel and said side wall of said first chamber are each provided with at least one aperture to permit the flow of liquid between the interior of said first chamber and the exterior of said baffle, said bottom panel of said first chamber is provided with at least one aperture to permit the flow of liquid between the interior of said second chamber and the interior of said first chamber, and said side wall of second chamber is provided with at least one aperture to permit the flow of liquid between the interior of said second chamber and the exterior of said baffle; and

wherein the area of said aperture or apertures in said side wall of said second chamber is greater than the area of said apertures or apertures in said side wall of said first chamber;



and wherein the combined height of said side wall of said first chamber and said side wall of said second chamber is less than the height of said side wall of said waterbed mattress, the height of said side wall of said first chamber being more than twice as great as the height of said side wall of said second chamber, and the volume of said first chamber being more than twice as great as the volume of said second chamber, and wherein said apertures are so configured that said second chamber collapses prior to said first chamber when said top wall of said waterbed mattress is forced downwardly against said top panel of said first chamber.

5,010,608

SUPPORT SYSTEM FOR REDUCING FORMATION OF DECUBITUS ULCERS

Richard I. Barnett, Bath, and William C. Knapp, Kingston, both of Canada, assignors to Du Pont Canada Inc., Mississauga and Queen's University at Kingston, Kingston, both of, Canada

Filed Oct. 11, 1989, Ser. No. 419,891
Int. Cl.[5] A47C *27/08*
U.S. Cl. 5—453 **36 Claims**

1. A support system comprising: a plurality of separate cells of selected size of shape in a monolayer, said cells being formed from flexible material; said material being sufficiently impermeable to a fluid contained in said cells so that each cell may be alternately (with respect to the adjacent cell) and repeatedly inflated and deflated; said cells being of such size and shape and having such intercellular spacing so that, in at least one of the width and length of said support system, the distance between centres of adjacent inflated cells (including the distance across a deflated cell) is less than approximately 25 millimeters; and said support system is capable of supporting a human body without bottoming out either of or between said inflated cells.

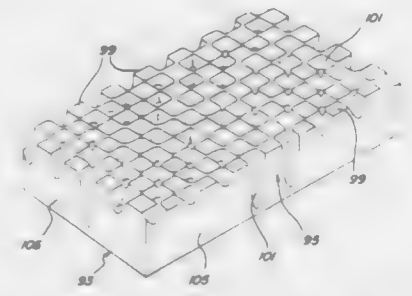
5,010,609

ANATOMICALLY CONFORMABLE FOAM SUPPORT PAD

David L. Farley, 18672 Evergreen Ave., Yorba Linda, Calif. 92686

Continuation of Ser. No. 176,925, Apr. 4, 1988, Pat. No. 4,879,776. This application Sep. 22, 1989, Ser. No. 411,051
The portion of the term of this patent subsequent to Nov. 14, 2006, has been disclaimed.
Int. Cl.[5] A47C *27/14*
U.S. Cl. 5—464 **20 Claims**

1. A convoluted foam pad for supporting a human body, comprising:



a bottom;

a shoulder support area for supporting the shoulder portion of a body formed by peaks arranged in rows, wherein each peak has a substantially flat top and is spaced from any adjacent peak in the same row by a valley;

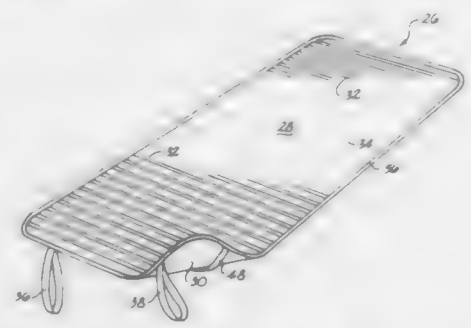
a tail support area for supporting the tail portion of said body formed by peaks arranged in rows, wherein each peak has

a substantially flat top and is spaced from any adjacent peak in the same row by a valley; and

a general support area surrounding said shoulder support area and said tail support area formed by peaks arranged in rows, wherein each peak has a substantially flat top and is spaced from any adjacent peak in the same row by a valley, said valleys of said shoulder support area, said

valleys of said tail support area and said valleys of said general support area each having an average valley thickness, wherein each of said peaks has a substantially uniform peak thickness and wherein said average valley thickness of said valleys in said shoulder support area and said average valley thickness of said valleys in said tail support area are less than said average valley thickness of said valleys in said general support area.

5,010,610



MULTILAYER SUPPLEMENTAL SUPPORT PAD

Robert E. Ackley, Greenville, S.C., assignor to Span-America Medical Systems, Inc., Greenville, S.C.

Filed Jan. 10, 1990, Ser. No. 463,338

Int. Cl.[5] A47G *9/06, 9/00;* **A47C** *27/14*

U.S. Cl. 5—481 **19 Claims**

1. A portable support pad, comprising:

an integral foam member comprising a generally rectangular shaped planar layer generally of a predetermined, constant thickness in a range from about one-fourth of an inch to about one inch thick;

fabric coverings received on both sides of said foam member layer and received about the edges of said layer so that said foam member is fully encased;

generally straight-line stitching through said pad at spaced intervals therealong so as to secure said fabric coverings to said foam member, said spaced intervals being generally no greater than about two and one-half inches, and said spaced stitching extending laterally relative said generally rectangular shaped foam member layer so that said pad may be rolled up in a longitudinal direction perpendicular to the direction of said stitching; and

elastic strap means comprising at least one integral loop secured at one end of said pad and functional when said pad is rolled up for surrounding said pad and elastically maintaining same in such rolled up condition.

FITTED SAFETY CRIB SHEET WITH INTEGRAL BUMPER LINER

Sarah Mallett, Box 571, Jackson, N.H. 03846

Continuation of Ser. No. 362,609, Jun. 7, 1989, abandoned. This application Jun. 27, 1990, Ser. No. 547,385

Int. Cl.[5] A47G *9/04;* **A47C** *27/08*

U.S. Cl. 5—497 **5 Claims**

1. A fitted sheet for a mattress for a crib with vertical rails, the mattress having a top plane surface and vertical sides, said sheet comprising

a peripheral edge coinciding with the vertical sides of the mattress, and, integral with said sheet,

a crib bumper liner with a top edge and a bottom edge, said bottom edge fixedly and permanently joined for its entire length to said peripheral edge of said sheet along an upper edge of the mattress in a manner to prevent a child from extending a limb between said bumper liner and said sheet, and

means for securing the top edge of said bumper liner to the vertical rails of the crib,

said integral sheet and crib bumper liner formed of a limp fabric material and adapted to be removed from a crib mattress for laundering.

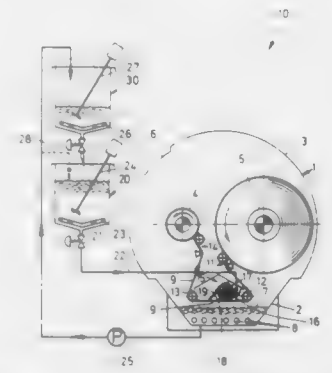
METHOD FOR TREATING A WEB OF MATERIAL IN A JIG



Manfred Driesen, and Dieter Itgenshorst, both of Krefeld, Fed. Rep. of Germany, assignors to Eduard Küsters Maschinenfabrik GmbH & Co KG, Krefeld, Fed. Rep. of Germany

Division of Ser. No. 326,462, Mar. 20, 1989, which is a continuation of Ser. No. 158,335, Feb. 22, 1988, abandoned. This application Dec. 4, 1989, Ser. No. 432,074

Claims priority, application Fed. Rep. of Germany, Feb. 20, 1987, 3705390

Int. Cl.[5] D06B *1/04*

U.S. Cl. 8—151 **4 Claims**

1. A method of treating a web of material in a jig having first and second housing portions with the second housing portion containing a bath comprising the steps of:

(a) mounting a web of material to be treated on two mutually parallel winding rollers disposed in the first housing portion;

(b) conducting the web of material along a path disposed in the first housing portion;

(c) filling a reservoir tank with the total quantity of treatment liquor necessary for at least one treatment pass of the web;

(d) supplying an applicator system with the quantity of treatment liquor contained in the reservoir tank;

(e) uniformly applying a proportioned quantity of treatment liquor to the web of material from the applicator system as the web passes along a portion of the path disposed above the level of the bath in the second housing portion; and

(f) maintaining the quantity of treatment liquor contained in the reservoir tank separate from the bath for at least one treatment pass of the web.

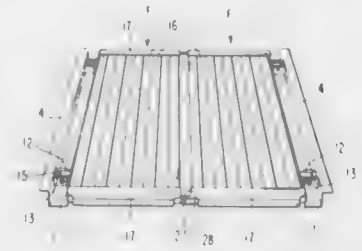
ARTICULATED BRIDGE GANGWAY BETWEEN RAILROAD CARS

Peter Braemert, Wolfenbuttel, and Ingo Britzke, Kassel, both of Fed. Rep. of Germany, assignors to Hubner Gummi - und Kunststoff GmbH, Kassel, Fed. Rep. of Germany

Filed Aug. 28, 1989, Ser. No. 399,767

Int. Cl.[5] E01D *1/00*



U.S. Cl. 14—71.1 **12 Claims**

1. An articulated bridge component for use in cooperation with another similar bridge component to span the space between two interconnected railway cars, comprising:

two laterally-spaced-apart side rails extending from one end of a railway car in the longitudinal direction of the car,

a floor plate including a frame having two side walls, and a plurality of bridge elements extending between the frame side walls and transverse to the longitudinal direction of said car;

means associated with the end of the floor plate remote from said car for interconnecting the floor plate with a similar floor plate extending from a second car coupled to said car,

a carriage slidable along the side rails in a direction toward and away from said car, and

means for interconnecting the carriage with the end of the floor plate nearest said car, so that the carriage and floor plate are movable together toward and away from said car in order to compensate for relative motion between two coupled cars in the longitudinal direction of the cars.

HAND-HOLDABLE TOOL HAVING A DETACHABLE HANDLE

Patricia Carter, 726 Kimberly Ct., Radcliff, Ky. 40160

Filed Jul. 28, 1989, Ser. No. 386,434

Int. Cl.[5] A47L *13/17, 17/08;* **B25G** *3/18*

U.S. Cl. 15—104.94 **13 Claims**

1. A hand-holdable tool comprising:

(A) a handle unit which includes a body having a rear end, a front end, sides, a top surface, and a bottom surface;

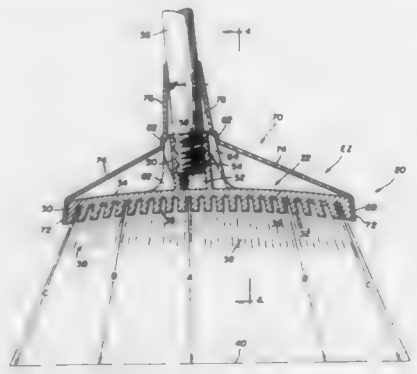
(B) a head unit which includes a body element having a forward end, an aft end, sides and an upper surface and a lower surface; and

(C) a locking and release mechanism detachably connecting said handle unit to said head unit and which includes

(1) a neck portion on the front end of said handle unit body,

(2) a cutout defined in said handle unit body and extending into said body neck portion and being defined by said body to have a rear end, a front end and sides, said cutout front end being located in said neck portion and said cutout rear end being located in said body, said neck portion having a top surface which is spaced from said body top surface, said neck portion having a curved shoulder portion connecting said neck portion top surface to said body top surface;

(3) a flexible arm connected at a rear end thereof to said body at said cutout rear end and extending into said cutout and into said neck portion and having a forward end thereof located adjacent to said cutout front end, said flexible arm having a top surface which is located adjacent to said body top surface, said flexible arm top surface being flush with said body top surface and with said neck portion top surface and with said curved shoulder for essentially the entire length of said flexible arm from the flexible arm rear end to the flexible arm forward end,



(4) a tooth on said flexible arm and located adjacent to said flexible arm forward end, said tooth including
(a) a shoulder which extends upwardly from said flexible arm top surface, and
(b) a ramp which intersects said tooth shoulder at a location spaced above said flexible arm top surface to form an apex, and which slopes downwardly from said apex toward said flexible arm forward end,
(5) said flexible arm being spaced from said cutout front end and sides and being movable with respect to said body toward said neck body bottom surface and being connected to said body to be biased into a position to locate said tooth apex above said neck portion top surface, said arm being movable against said bias to locate said tooth apex beneath said neck portion top surface,
(6) a neck portion receiving channel defined interiorly of said head unit body element to extend from said body element aft end towards said body element forward end and being sized to accommodate said body neck portion, and
(7) lock receiving means defined in said head unit body element and located adjacent to said channel and including a recess defined in said body element and opening into said channel, said body element having a ledge defining one side of said recess with said ledge being located to abut said tooth shoulder when said neck portion is fully inserted into said channel with said apex positioned above said neck portion top surface to lock said head unit to said handle unit.

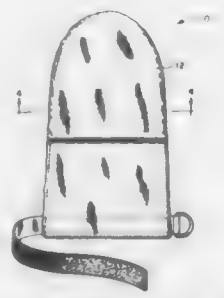
SLANTED HANDLE BROOM

Enzo Berti, Mirano, Italy, assignor to The Libman Company, Arcola, Ill.

Filed Nov. 27, 1989, Ser. No. 441,478
Int. Cl.[5] A46B *9/02*
U.S. Cl. 15—159 R **22 Claims**



1. A broom comprising:
an elongated block with opposing side walls and end walls, a top and, when viewed in side elevation, having a concavely curved bottom;
the block bottom having a plurality of spaced apart holes extending into the block from the block bottom;
a plurality of tufts of broom fibers, with each tuft comprising a plurality of fibers having essentially the same length, with each tuft having an upper end and a lower end and with the tufts taken as a group having fibers of essentially the same length;
the holes in the block bottom having about the same depth; each hole containing the upper end of a tuft of broom fibers embedded therein whereby a fanning effect results in which the fibers fan out from the block bottom to the lower end of the tuft;
each of the holes in the block concavely curved bottom having a direction such that the respective tufts embedded in the holes extend downwardly from the block concavely curved bottom for a substantially uniform length and the concavity of the block bottom compensates for the fanning effect of the tufts so that the lower ends of the tufts terminate in a horizontal plane and provide a straight sweeping surface, without a need to cut the lower ends of the tufts after they are embedded in the holes; and
the lower end of a broom handle being connected to the block.

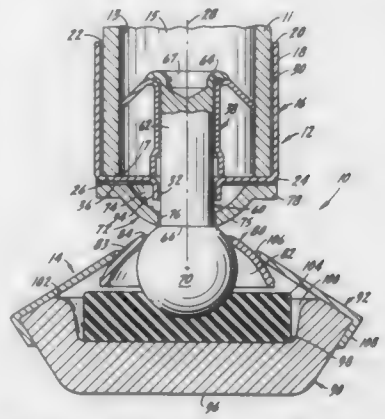
STALL AND PASTURE VACUUM MACHINE

Ronald E. Young, Rte. 1, Box 1340 OSR, Bryan, Tex. 77803

Filed May 22, 1989, Ser. No. 355,482
Int. Cl.[5] B60P *1/34*
U.S. Cl. 15—347 **6 Claims**

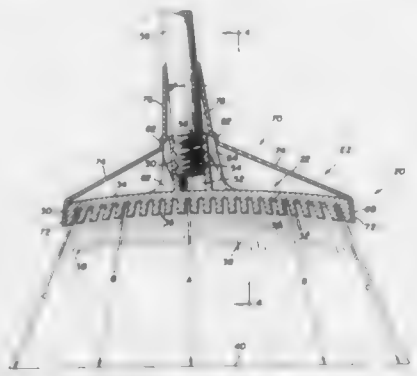


1. A stall and pasture vacuum machine comprising:
a trailer frame supported by an axle and wheels;
an extension at the one end of said frame;
centrifugal blower means mounted on said extension, said blower means having a vertical outlet;
drive train means mounted on said extension and connected to a pulley drive, said pulley drive rotating said blower means;
a mucking device supported by and below said extension, said mucking device having a pair of skids adapted to be pulled along the ground;
receptacle means pivoted at the other end of said frame, said receptacle means having inlet means connectable to said vertical outlet of said blower means; and
flexible hose means connected to said mucking device whereby said blower means will suck manure on the ground into said receptacle means.

5,010,621

GLIDE ASSEMBLY WITH INSIDE HOLDING CLIP

Robert E. Bock, Woodbury, Conn., assignor to Illinois Tool Works, Inc., Glenview, Ill.



Filed Nov. 16, 1989, Ser. No. 437,388
Int. Cl.[5] B60B *33/00*
U.S. Cl. 16—39 **10 Claims**

1. An inner gripping glide assembly for mounting upon a tubular member, wherein said tubular member has an inner surface and an outer surface, comprising:
an upper sub-assembly, for mounting said glide assembly upon said tubular member, comprising a substantially cup-shaped housing having an upstanding peripheral wall for engaging said outer surface of said tubular member, and an end wall for engaging a lower open end of said tubular member, an aperture being defined within said end wall of said housing; and a tubular clip comprising a body having a longitudinal axis, a first lower end of said body being engaged with said end wall of said housing, and a plurality of resiliently flexible gripping prongs extending downwardly from a second upper end of said tubular clip body at a predetermined acute angle with respect to said longitudinal axis of said tubular clip body and integrally formed therewith as a single piece for resiliently and flexibly engaging said inner surface of said tubular member so as to retain said upper sub-assembly, and said glide assembly, upon said tubular member, said tubular clip body and said prongs having the same relatively small thickness dimension such that said prongs are resiliently flexible and wherein the outer diametrical extent of said tubular clip body is only slightly greater than the inner diametrical extent thereof whereby the outer peripheral surface of said tubular clip body is remotely spaced from said inner surface of said tubular member so as to permit said prongs to undergo substantial flexure toward and away from said tubular clip body in order to accommodatingly engage said inner surface of a particular one of a plurality of tubular members having different internal diametrical dimensions;
a lower sub-assembly having a floor-engaging base of said glide assembly mounted thereon; and
means, engaged at one end thereof with said lower sub-assembly, and projecting upwardly through said aperture, defined within said end wall of said housing of said upper sub-assembly, and said tubular clip body such that a sec-

(4) a tooth on said flexible arm and located adjacent to said flexible arm forward end, said tooth including
(a) a shoulder which extends upwardly from said flexible arm top surface, and
(b) a ramp which intersects said tooth shoulder at a location spaced above said flexible arm top surface to form an apex, and which slopes downwardly from said apex toward said flexible arm forward end,
(5) said flexibie arm being spaced from said cutout front end and sides and being movable with respect to said body toward said neck body bottom surface and being connected to said body to be biased into a position to locate said tooth apex above said neck portion top surface, said arm being movable against said bias to locate said tooth apex beneath said neck portion top surface,
(6) a neck portion receiving channel defined interiorly of said head unit body element to extend from said body element aft end towards said body element forward end and being sized to accommodate said body neck portion, and
(7) lock receiving means defined in said head unit body element and located adjacent to said channel and including a recess defined in said body element and opening into said channel, said body element having a ledge defining one side of said recess with said ledge being located to abut said tooth shoulder when said neck portion is fully inserted into said channel with said apex positioned above said neck portion top surface to lock said head unit to said handle unit.

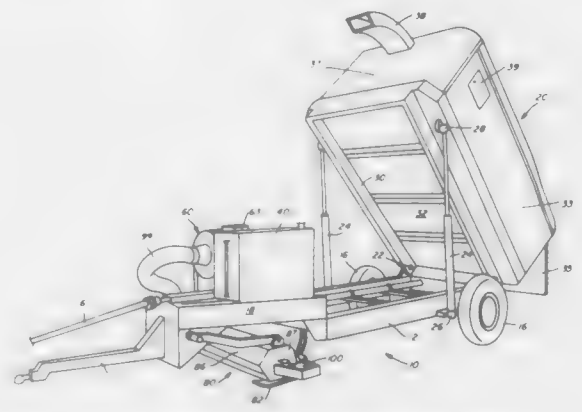
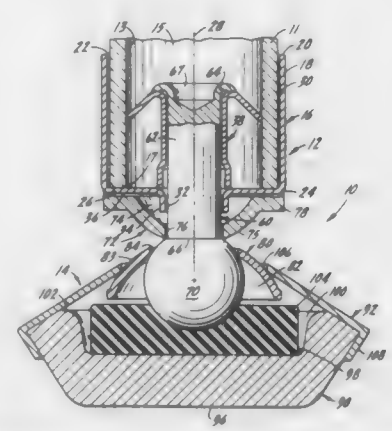
U.S. Cl. 15—235.7 **5 Claims**



1. A corner finishing tool comprising a head including a pair of interconnecting wings extending from a junction at a selected angle from one another; a socket for a ball formed in the junction of the wings at rear faces of the wings; a ridge projecting from the intersection of the wings at face surfaces of the wings and having a leading edge and a rear end; a flange arranged around the outermost peripheral edges of the wings and connecting to a rear end of the ridge; and a mud dam projecting from a front face of each wing to the outermost surface of said ridge and extending rearwardly and outwardly of said ridge into engagement with said wing flange, with the outermost edge of said flange projecting from each wing face surface beyond the outermost edge of each said dam.

5,010,619
NOZZLE FOR DRYING SHEET GLASS
Peter Lisec, Bahnhofstrasse 34, A-3363 Amstetten-Hausmening, Austria
Filed Mar. 20, 1990, Ser. No. 496,952
Claims priority, application Austria, Apr. 11, 1989, 853/89
Int. Cl.[5] A47L *5/38, 15/00*
U.S. Cl. 15—307 **12 Claims**



1. In a sheet glass washing machine (1) having conveying means (5) for conveying glass sheets successively through a washing zone (2) and a drying zone (3) and having in said drying zone a nozzle (10) having air outlet opening means (11) that extend upwardly in a direction away from said conveying means (5); the improvement comprising at least one shutoff element (12) for selectively shutting off a region of said opening means (11) located farthest from said conveying means (5), and means (16) for moving said at least one shutoff element (12) between positions in which it opens and closes said region.

5,010,620
STALL AND PASTURE VACUUM MACHINE
Ronald E. Young, Rte. 1, Box 1340 OSR, Bryan, Tex. 77803
Filed May 22, 1989, Ser. No. 355,482
Int. Cl.[5] B60P *1/34*
U.S. Cl. 15—347 **6 Claims**

1. A stall and pasture vacuum machine comprising:
a trailer frame supported by an axle and wheels;
an extension at the one end of said frame;
centrifugal blower means mounted on said extension, said blower means having a vertical outlet;
drive train means mounted on said extension and connected to a pulley drive, said pulley drive rotating said blower means;
a mucking device supported by and below said extension, said mucking device having a pair of skids adapted to be pulled along the ground;
receptacle means pivoted at the other end of said frame, said receptacle means having inlet means connectable to said vertical outlet of said blower means; and
flexible hose means connected to said mucking device whereby said blower means will suck manure on the ground into said receptacle means.

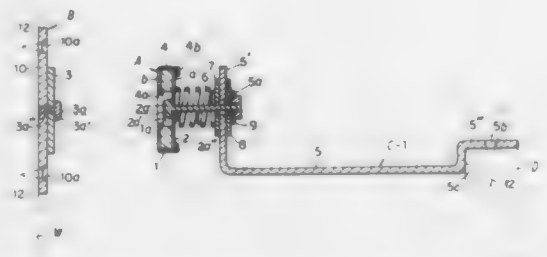
5,010,621
GLIDE ASSEMBLY WITH INSIDE HOLDING CLIP
Robert E. Bock, Woodbury, Conn., assignor to Illinois Tool Works, Inc., Glenview, Ill.
Filed Nov. 16, 1989, Ser. No. 437,388
Int. Cl.[5] B60B *33/00*
U.S. Cl. 16—39 **10 Claims**

1. An inner gripping glide assembly for mounting upon a tubular member, wherein said tubular member has an inner surface and an outer surface, comprising:
an upper sub-assembly, for mounting said glide assembly upon said tubular member, comprising a substantially cup-shaped housing having an upstanding peripheral wall for engaging said outer surface of said tubular member, and an end wall for engaging a lower open end of said tubular member, an aperture being defined within said end wall of said housing; and a tubular clip comprising a body having a longitudinal axis, a first lower end of said body being engaged with said end wall of said housing, and a plurality of resiliently flexible gripping prongs extending downwardly from a second upper end of said tubular clip body at a predetermined acute angle with respect to said longitudinal axis of said tubular clip body and integrally formed therewith as a single piece for resiliently and flexibly engaging said inner surface of said tubular member so as to retain said upper sub-assembly, and said glide assembly, upon said tubular member, said tubular clip body and said prongs having the same relatively small thickness dimension such that said prongs are resiliently flexible and wherein the outer diametrical extent of said tubular clip body is only slightly greater than the inner diametrical extent thereof whereby the outer peripheral surface of said tubular clip body is remotely spaced from said inner surface of said tubular member so as to permit said prongs to undergo substantial flexure toward and away from said tubular clip body in order to accommodatingly engage said inner surface of a particular one of a plurality of tubular members having different internal diametrical dimensions;
a lower sub-assembly having a floor-engaging base of said glide assembly mounted thereon; and
means, engaged at one end thereof with said lower sub-assembly, and projecting upwardly through said aperture, defined within said end wall of said housing of said upper sub-assembly, and said tubular clip body such that a sec-

ond end thereof engages said second upper end of said tubular clip body, for coupling said lower sub-assembly to said upper sub-assembly.

5,010,622

DOOR STOPPER



Tamao Morita, 47-1 Arakawa 6-chome Arakawa-ku, Tokyo, Japan

Continuation of Ser. No. 295,677, Jan. 11, 1989, abandoned. This application Jun. 26, 1990, Ser. No. 544,098

Claims priority, application Japan, Apr. 28, 1988, 63-103834; Apr. 28, 1988, 63-103835; Apr. 28, 1988, 63-103836; Apr. 28, 1988, 63-103837

Int. Cl.[5] E05C *17/56*

U.S. Cl. 16—85 11 Claims

1. An apparatus for stopping and holding a door open, comprising:

(a) a first ferromagnetic plate means comprising:

a first ferromagnetic plate having a hole in its center; and

a first ferromagnetic projection being positioned through said hole;

(b) a magnetic holding means comprising:

a disk-like permanent magnet having a hole through its center;

a second disc-like ferromagnetic plate having a hole being positioned against a first pole of said permanent magnet;

means for fixedly holding said permanent magnet against said second ferromagnetic plate; and

a second ferromagnetic projection being positioned through said holes of said magnetic holding means;

(c) a first mounting mans for mounting one of said first plate means and said magnetic holding means on one of said door and a co-operating fixed surface;

(d) a second mounting means for mounting the other of said first plate means and said magnetic holding means on the other of said door and said fixed surface; and

(e) a biasing means for biasing one of said magnetic holding means and said first plate on said second mounting means away from the respective door and cooperating fixed surface,

whereby when said door is moved to its open position, a second pole of said permanent magnet being positioned and aligned with said first plate means to complete a magnetic circuit to hold said door open and said first projection engaging said second projection within said hole of said permanent magnet to enhance said magnetic circuit.

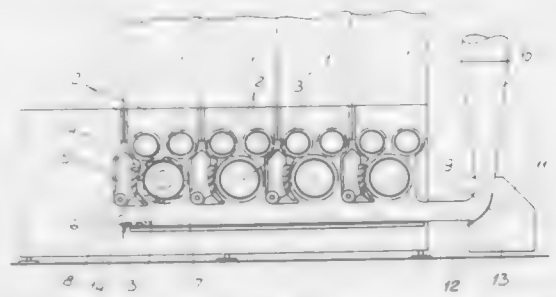
TEXTILE FIBRE MIXING APPARATUS

Pietro B. Marzoli, and Emilio Vezzoli, both of Via Durante, 1, Palazzolo sull'Oglio (BS), Italy



Filed Nov. 8, 1989, Ser. No. 433,512

Claims priority, application Italy, Jun. 1, 1989, 20727/89[U]

Int. Cl.[5] D01G *13/00*

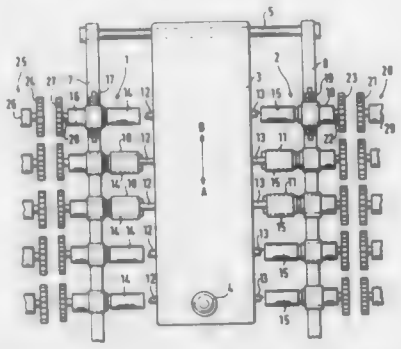
U.S. Cl. 19—145.5 1 Claim

1. A mixing apparatus for mixing textile fibres, in particular cotton staple fibres, comprising a plurality of adjoining vertical cells supplied with a fibre material to be processed, two counter-rotating horizontal parallel rollers arranged at bottom portions of said cells, a staple opening cylinder arranged under said rollers, a vertical grid adjoining said cylinder and communicating with a not spinnable material collecting chamber, said collecting chamber including a rotary worm screw for removing not spinnable waste material, said cells opening, at said bottom portion thereof, on a horizontal rectangular cross-section channel for conveying textile material to be processed to a further processing machine and being provided with means for removing settled particles from said channel, said channel

being closed at one end thereof by a closing grid, said channel extending at an opposite end thereof with an upward curved portion and a fibre material suction duct for conveying said material to said further processing machine, said upward curved portion of said channel being defined by a comb member correspondingly curved and operating as a gate member, said comb member having teeth spaced with a pitch from 2 to 10 mm and being pivoted, against a coil spring, on a horizontal axis so as to communicate said curved portion with a static negative pressure chamber, said channel further comprising, near said closing grid, an air blowing device which is so controlled as to increase a suction air flow rate.

5,010,624

SPINNING MACHINE HAVING SEVERAL SPINNING POINTS



Fritz Stahlecker, Bad Überkingen, Fed. Rep. of Germany, assignor to Hans Stahlecker, Fed. Rep. of Germany, a part interest

Filed Dec. 6, 1989, Ser. No. 446,694

Claims priority, application Fed. Rep. of Germany, Dec. 9, 1988, 3841544

Int. Cl.[5] D01H *5/74*

U.S. Cl. 19—261 18 Claims

1. A drafting arrangement for a spinning machine having several spinning points, at least one drafting unit being assigned to each of these spinning points and each drafting unit containing several top rollers and several drivable bottom rollers, and at least the bottom rollers assigned to a feeding side for fiber material being driven by a common drive shaft extending in a longitudinal direction of the machine by means of transmission devices containing a shiftable coupling for selectively engaging and disengaging a driving connection between the common drive shaft and respective ones of said bottom rollers, wherein at least the bottom rollers assigned to the feeding side are arranged adjustably for accommodating the adjusting of their position with respect to the respective rollers which follow while maintaining a driving connection between the common drive shaft and the respective ones of said bottom rollers.

5,010,625

SCREW-ON BUTTON

Richard A. Joyer, P.O. Box 778, Pearsall, Tex. 78061

Filed Jun. 2, 1989, Ser. No. 360,472

Int. Cl.[5] A44B *1/18*

U.S. Cl. 24—90 R 3 Claims

1. An assembly for fastening a button head onto a fabric, comprising:

a head;

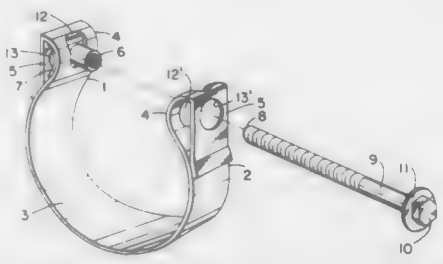
a post connected to said head, said post having a first portion and a second portion;

said first portion detachably connected to said second portion with a circumferential notch formed therebetween, said second portion being a means for penetration through said fabric, said circumferential notch being a means for breaking the connection between said first portion and said second portion; and

a disc family engageable with said first portion of said post after detachment of said second portion such that said head is rigidly fixed onto said fabric.

5,010,626

HOSE CLAMP WITH FLANGED CAPTIVE TENSIONING NUT AND PIVOTED BRIDGING ELEMENT



Ramon P. Dominguez, Barcelona, Spain, assignor to Mikalor, S.A., Barcelona, Spain

Filed Oct. 25, 1989, Ser. No. 426,440

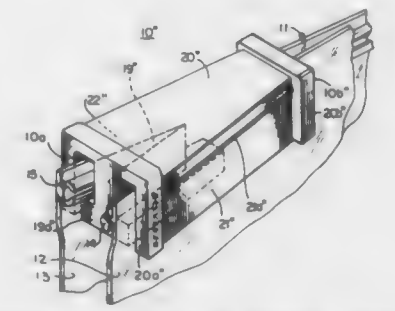
Claims priority, application Spain, Nov. 3, 1988, 8803895; Feb. 10, 1989, 8900808

Int. Cl.[5] F16L *33/04*

U.S. Cl. 24—279 6 Claims

1. A hose clamp comprising a metal strap having first and second closed loops, each said first and second closed loops having a pair of inner and outer aligned slots, said first closed loop having a curved section joined by a substantially straight section in a sharply defined joining angle, an end portion of said straight section being bonded to said strap to form said first closed loop, a captive nut frictionally mounted within said first loop, said captive nut comprising a cylindrical tubular barrel with internal threads and a continuous circumference, an elongated semicylindrical curved flange extending from an end portion of said tubular barrel, the curvature of said flange corresponding to the curvature of said curved section within said first loop, said tubular barrel extending through said inner slot with said attached flange abutting the internal curvature of said first loop, and tensioning means comprising a threaded bolt passing through the aligned openings of said second loop and threaded into said tubular barrel whereby threading said bolt in mid tubular barrel causes said tubular barrel to pull said flange and abutting curved section of said first loop toward said second loop to tighten the clamp.

5,010,627



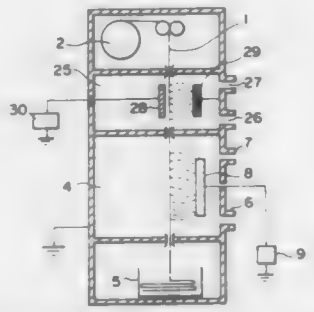
FOLDABLE PLASTIC SLIDER AND METHOD OF ASSEMBLY WITH A PLASTIC RECLOSABLE FASTENER

Fox J. Herrington, Holcomb, and Alex Goncarovs, Canandaigua, both of N.Y., assignors to Mobil Oil Corporation, Fairfax, Va.

Filed Mar. 7, 1990, Ser. No. 490,108

Int. Cl.[5] A44B *19/00*

U.S. Cl. 24—400 11 Claims



1. A foldable plastic slider for straddling relation with a profiled plastic reclosable fastener particularly suited for thermoplastic bags and the like formed by a pair of flexible plastic sheets having a top edge with separable fastener means extending along the length thereof comprising reclosable interlocking rib and groove profile elements on the respective sheets, the straddling slider for closing or opening the reclosable fastener elements comprising a separator finger and interlocking complementary structure formed from plastic for moving along the fastener, the complementary structure comprising a transverse support member having the wedged-shaped separator finger depending therefrom, said support member having depending structure located on opposite sides of said separator finger, a pair of side walls connected to said support member at locations adjacent said depending structure and at least one of said side walls being foldable relative to said depending structure, and means for interlocking said depending structure with said side walls to interlock said side walls with said support member, said side walls extending from an opening end of the slider to the closing end, the side walls being spaced wider apart at the opening end to permit separation of the rib and groove elements by the separator finger extending between the side walls at the opening end, the side walls being spaced sufficiently close together at the closing end to press the rib and groove elements into interlocking relationship as the slider is moved in a fastener closing direction, at least one of said separator finger and said side walls having shoulder structure on the bottom thereof for cooperating with the bottom of the fastener to prevent the slider from being lifted off the top edge of the fastener while the slider straddles the fastener.

5,010,628

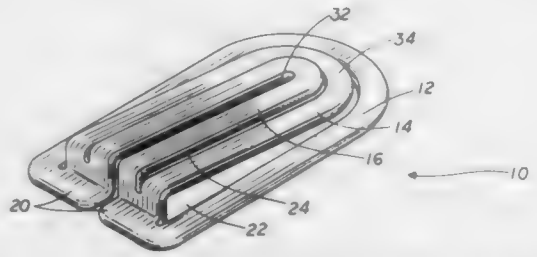
COUPLING ELEMENT ROW FOR SLIDE FASTENER AND SURFACE TREATING METHOD FOR THE SAME

Hiroshi Yamagata, Tateyama, Japan, assignor to Yoshida Kogyo K.K., Tokyo, Japan

Filed Apr. 9, 1990, Ser. No. 506,247
Claims priority, application Japan, Apr. 7, 1989, 1-86848
Int. Cl.[5] A44B *19/02*
U.S. Cl. 24—405 5 Claims

1. A surface treating method for a coupling element row for a slide fastener comprising the steps of:

etching the surface of a continuous coupling element row made of a synthetic resin, and



depositing fine metal particles individually on the etched surface of said continuous coupling element row by sputtering while feeding said coupling element row so as not to distort the pitch thereof.

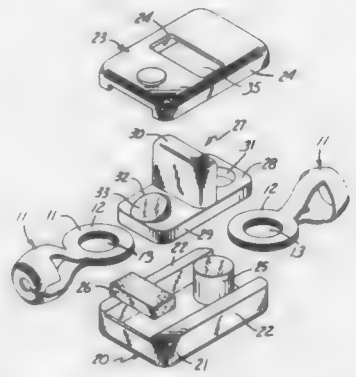
5,010,629

PAPER CLIP WITH VERTICAL PANEL

Suzy C. Hirzel, 933 Shellwood Way, Sacramento, Calif. 95831

Filed Dec. 27, 1989, Ser. No. 457,948
Int. Cl.[5] B42F *1/02*
U.S. Cl. 24—67.9 5 Claims

1. An Improved Clip with a Neck comprising: Upper, middle and lower horizontal panels having front, side and back, with a generally vertical neck having bottom and top surface, said bottom surface is connected to said lower panel, said top surface is connected to said middle panel, said lower panel is larger than said middle panel, and said middle panel is larger than the upper panel, the front tip of said upper and middle panels are tapered for easy insertion of objects, said lower panel back is connected to horizontal base, said base is adapted to be pushed down by finger(s) to steady said clip while said panels are opened for loading of objects, said lower and middle panels having a vertical gap therebetween, said gap is greater at the back of he panel area than the front panel area when said panels are not in use, said upper panel and middle panel are in the same plane, said lower and middle panel accomodate thicker object therebetween than between said middle and upper panels, said lower panel is generally in a straight line, said clip is made of one piece, said clip is longer in length form front to back than from side to side,



Wherein said upper panel, neck, and base having a single slot for flexibility and minimumizing the total weight of the clip.

5,010,630

CLASP MECHANISM

Steven E. Mickelson, 1509 W. Seventh St., Red Wing, Minn. 55066

Filed Dec. 15, 1989, Ser. No. 451,043
Int. Cl.[5] A44C *5/00*
U.S. Cl. 24—647 4 Claims

1. A clasp for releasably securing opposed first and second ends of a strand, wherein said clasp is adapted to be secured to said first end of said strand and to releasably engage said second end of said strand, said clasp comprising:

(a) A casing having top and bottom portions defining a first and second end, each of said first and second ends having an opening defined therein;

(b) A post positioned within said casing connecting said top and bottom portions adjacent said opening in said first end of said casing;

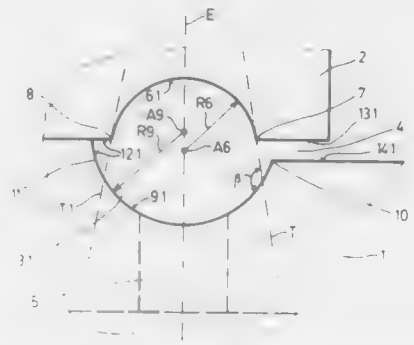
(c) A first end engaging element adapted to engage said first end of said strand, said first end engaging element being secured to said post;

(d) A latch member mounted within said casing to said post, said latch member having an upwardly projecting lug located adjacent said opening in said second end of said casing, said latch member being operable between a first, engaged position and a second, disengaged position;

(e) Springs means for biasing said latch member in said first, engaged position;

(f) A second end engaging element adapted to be secured to said second end of said strand, said second end engaging element being insertable through said opening in said second end of said casing for engagement with said lug of said latch member; and

(g) Means for deflecting said latch member from said first, engaged position to said second, disengaged position.



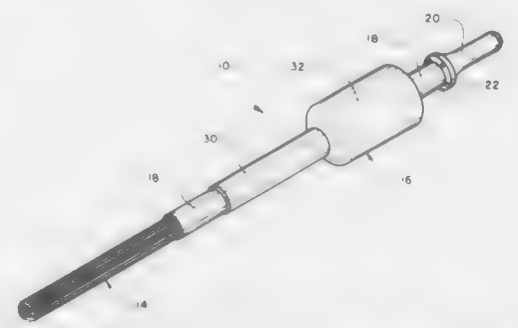
5,010,631

AIR NOZZLE FOR THE INTERLACING OF MULTIFILAMENT YARNS

Helmut Ritter, Wattwil, Switzerland, assignor to Helmrlein Maschinenfabrik AG, Wattwil, Switzerland

Filed Feb. 6, 1990, Ser. No. 475,835
Claims priority, application Switzerland, Feb. 15, 1989, 530/89
Int. Cl.[5] D02J *1/08*
U.S. Cl. 28—274 9 Claims

1. An air nozzle for the interlacing of multifilament yarns, with a continuous yarn channel (3.1; 3.3) into which terminate laterally at least one air feed bore (5) and a threading slot (4), characterized in that the wall of the yarn channel (3.1; 3.3) comprises two wall sections of arcuate concave cross section, namely a baffle wall section (6.1; 6.3) lying in opposition to the orifice of the air feed bore (5) and a nozzle wall section (9.1; 9.3) proximate to the orifice of the air feed bore (5), the threading slot (4) terminating into the yarn channel (3.1; 3.3) between the baffle wall section and the nozzle wall section; and that the tangential plane (T) on the baffle wall section (6.1; 6.3) containing an orifice rim (7) of the threading slot (4) lying in the baffle



wall section (6.1; 6.3) passes through the nozzle wall section (9.1; 9.3).

5,010,632

DESCALING DEVICE

Thomas A. Gardner, 22397 Park Edge Cir., Fairview Park, Ohio 44126

Filed Apr. 2, 1990, Ser. No. 503,459
Int. Cl.[5] B21C *43/04*
U.S. Cl. 29—81.14 10 Claims

1. A device for removing foreign material from surfaces, such as metal, wood, stone, or the like, comprising:

an elongates shank aligned along a central axis having a first end and a second end;

a plurality of elongated descaling members assembled side-by-side in a closely packed bundle;

means for securing said descaling members to said first end of said shank, wherein said descaling members extend longitudinally therefrom along said axis and are movable therewith;

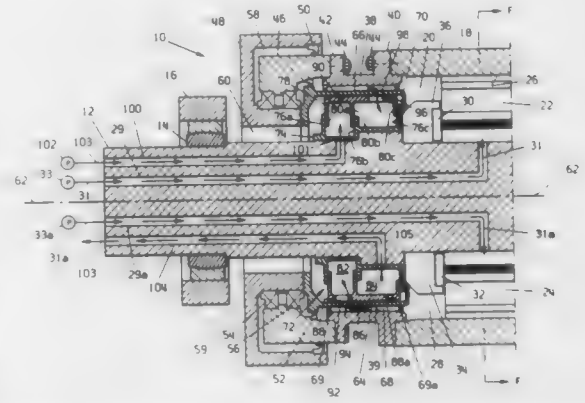
means for attaching said second end of said shank to reciprocating means; and

sleeve means having a bore extending therethrough, said bore dimensioned to slidably receive said shank and said descaling member therein, said sleeve means being movable along said shank to vary the portion of said descaling members confined therein.

5,010,633

CONTROLLED DEFLECTION ROLL WITH HEAT BARRIER

Dale A. Brown, Milton, and Arnold J. Roerig, Beloit, both of Wis., assignors to Beloit Corporation, Beloit, Wis.



Filed Jun. 21, 1990, Ser. No. 541,578
Int. Cl.[5] B21B *29/00*
U.S. Cl. 29—113.2 21 Claims

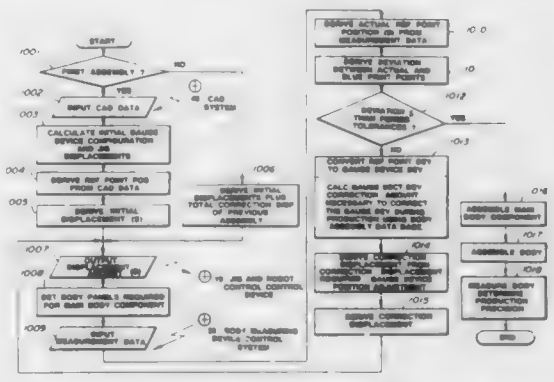
1. In a controlled deflection roll for moving into, and out of, nipping engagement with a mating roll, and having a non-rotatable center shaft, a hollow, cylindrical roll shell having a longitudinal axis of rotation and disposed about the center shaft to define an interior cavity of the roll therewith, bearings near either end of the center shaft and disposed about the center shaft, support means to support the roll shell against the center shaft to position the roll shell into, and out of, nipping engagement with the mating roll, or to adjust the nip line of contact therebetween, or both, the combination comprising:

bearing means near either end of the roll shell;

the bearings rotatably locating the bearing means co-axially relative to the roll shell, or an annular, co-axial spacer extension thereof;

means for maintaining bearing lubricant in the bearing means for lubricating the bearings;

means for supplying hydraulic fluid for actuating the support means and lubricating the interface between the roll shell and support means in the interior cavity; and



barrier means disposed between the roll shaft and the roll shell, or an annular, co-axial spacer extension thereof, near at least one end of the roll, the barrier means comprising a radially extensible chamber means for receiving a cooling liquid, said barrier means comprising a liquid barrier and a heat shield between the hydraulic fluid in the interior cavity and the bearing on the corresponding end of the roll.

VEHICLE ASSEMBLY METHOD AND APPARATUS

Satoshi Uemura, Tokyo; Susumu Kawada, Kumakura; Yoshitada Sekine, Yokohama, and Tatsuo Miyauchi, Utsunomiya, all of Japan, assignors to Nissan Motor Company, Ltd., Yokohama, Japan

Filed Dec. 9, 1988, Ser. No. 282,189
Claims priority, application Japan, Dec. 10, 1987, 62-313024
Int. Cl.[5] B23P *21/00*
U.S. Cl. 29—407 4 Claims

1. An assembly arrangement wherein a plurality of work pieces are to be connected with a given degree of precision to a structure, comprising:

means for determining a position in which each of said plurality of work pieces should be connected relative to

said structure using pre-recorded data which relates to the design of said structure;

work support means for supporting and moving each of said plurality of work pieces into its determined position relative to said structure;

means for determining a correct position for each of a plurality of reference points defined on each of said plurality of work pieces using said pre-recorded structure design data;

structure measuring means for determining an actual position for each among said plurality of reference points;

means for determining the deviation between the actual position and the correct position for each of said reference points while each of said work pieces are supported in situ;

a memory bank, said memory bank containing said pre-recorded data and an inference means, wherein said inference means is used in combination with said pre-recorded data to determine correction values for correcting any deviations which are in excess of predetermined tolerances in a manner which reduces or eliminates the deviations; and

means for fixing said work pieces to said body when the deviations between the correct and actual reference points are within said predetermined tolerances.

2. In a method of assembling a structure wherein a plurality of work pieces are connected with a given degree of precision, to a structure the steps of;

determining a position in which said plurality of work pieces should be disposed relative to a body forming part of said structure using pre-recorded data which related to the design of said structure;

using work support means to support and move said plurality of work pieces into the determined positions relative to said body;

determining a correct position for each of a plurality of reference points defined on each of said plurality of work pieces, using said pre-recorded data;

determining an actual position for each of said plurality of reference points using structure measuring means;

determining the deviation between each of the actual positions and the correct positions of each of said reference points after each of said work pieces have been moved into said determined position;

using a memory bank which contains said pre-recorded moved into said determined positions;

using a memory bank which contains said pre-recorded data and an inference means wherein said inference means is used in combination with the pre-recorded data to determine correction values for correcting any deviations which are in excess of predetermined tolerances in a manner which reduces or eliminates the differences; and

fixing said work pieces to said body when the deviations between the correct and actual reference points are within said predetermined tolerances.

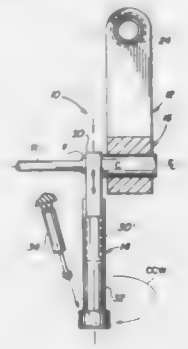
SUCKER ROD COUPLING BREAKING TOOL

Paul H. Clark, Box 69308, Odessa, Tex. 79769-9308

Filed Jul. 5, 1988, Ser. No. 215,064

Int. Cl.[5] B23P *19/04*

U.S. Cl. 29—426.5 **10 Claims**



1. Method of loosening a rod coupling that is threadedly attached to an end of a joint of sucker rod having wrench flats thereon, said rod coupling has a smooth outer surface and an axial centerline; comprising the steps of:

surrounding the coupling with a radially active coupling engaging means; providing said radially active coupling engaging means with three longitudinally extending clamp members that have a circumferentially extending interior that jointly extend 360 degrees about the axial centerline of the coupling; and,

pivotally attaching a pair of clamp arms to opposed ends of a link and pivotally attaching one said clamp member to the link, another clamp member to one arm, and the other clamp member to the other arm;

and moving the arms towards one another with a scissor-like action to grasp the coupling between the clamp members with great force;

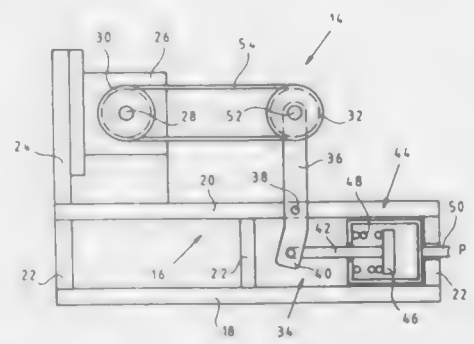
extending an open-ended wrench into engagement with the wrench flat of the joint of sucker rod, and then radially moving the coupling engaging means into engagement

with the outer surface of the coupling with a force that is of a magnitude required to break the threaded connection between the rod and coupling when the rod is rotated respective to the coupling;

rotating the open-ended wrench respective to the coupling engaging means until the threaded connection is broken and then rotating the coupling respective to the rod to remove the coupling from the end of the rod.

5,010,636

METHOD FOR PRECONDITIONING BELTS ON BELT DRIVES



Erich Hall, Wettstetten, and Helmut Schorwerth, Ingolstadt, both of Fed. Rep. of Germany, assignors to Audi AG, Ingolstadt, Fed. Rep. of Germany

Filed Jun. 23, 1989, Ser. No. 370,838

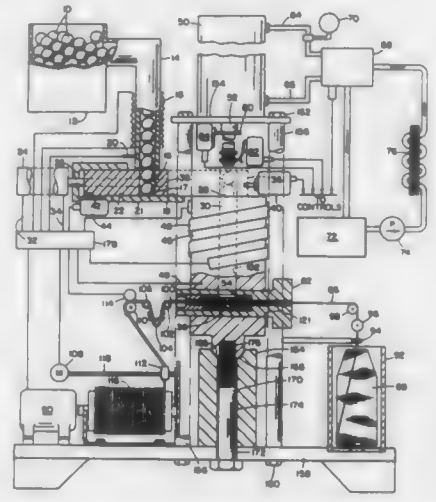
Claims priority, application Fed. Rep. of Germany, Jun. 24, 1988, 3821369

Int. Cl.[5] B23P *11/02*

U.S. Cl. 29—446 **10 Claims**

1. A method of providing a belt on a belt drive comprising the steps of driving the belt on a preconditioning device at a predetermined tension level and for a predetermined period of time prior to installing the belt on the belt drive, and installing the belt on the belt drive immediately after removal from the preconditioning device.

5,010,637



METHOD AND APPARATUS FOR COATING A CORE MATERIAL WITH METAL

Richard J. Blanyer, P.O. Box 18394, Austin, Tex. 78760, and Charles L. Mathews, P.O. Box 6290, Austin, Tex. 78762

Continuation of Ser. No. 14,250, Feb. 12, 1987, abandoned, which is a division of Ser. No. 763,851, Aug. 12, 1985, Pat. No. 4,658,623, which is a continuation-in-part of Ser. No. 643,676, Aug. 22, 1984, abandoned. This application Nov. 10, 1988, Ser. No. 255,973

Int. Cl.[5] B21D *39/00*

U.S. Cl. 29—505 **2 Claims**

1. A method for coating elongated core material with metal, comprising the steps of:

feeding an elongated core material into an extrusion die;

providing a compression chamber having an inside wall and a piston within said compression chamber, said piston having an opening therethrough which is completely surrounded by said piston;

feeding a metal into said compression chamber;

moving said piston within said compression chamber thereby creating an extrusion pressure and compressing said metal from the compression chamber into the extrusion die;

directing a portion of the metal in the compression chamber through the opening in said piston and into an annular region formed by the piston and the inside wall of the compression chamber with a pressure less than the extrusion pressure, thereby sealing the piston along the inside wall of the compression chamber and substantially preventing leakage of said metal past the piston during compression of the metal; and

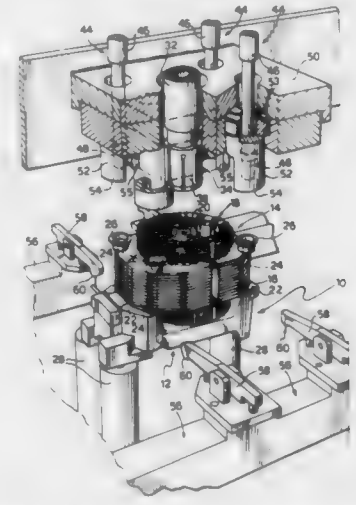
applying a uniform coating of the metal in the extrusion die to the core material as the core material is fed through the die.

5,010,638

METHOD FOR THE ASSEMBLY OF SMALL ELECTRICAL MACHINES

Antonello Lanfranco, Turin, Italy, assignor to Aspera S.r.l., Turin, Italy

PCT No. PCT/EP88/00165, § 371 Date Oct. 2, 1989, § 102(e) Date Oct. 2, 1989, PCT Pub. No. WO88/07781, PCT Pub. Date Oct. 6, 1988



PCT Filed Mar. 4, 1988, Ser. No. 411,533

Claims priority, application Italy, Apr. 1, 1987, 67257 A/87

Int. Cl.[5] H02K *15/02*

U.S. Cl. 29—596 **5 Claims**

1. A method for assembling a stator (**14**) comprised of a stack of core laminations (**16**) and windings (**18**) therefor on to a respective head support (**12**) of a small rotary electrical machine in a position concentric with a rotary shaft (**20**) mounted in the support (**12**), in which the periphery of one end face of the stack (**16**) of laminations rests on peripheral coplanar surfaces (**22**) of the support (**12**) which define a reference plane (P), a centering device (**34**) is interposed between the shaft (**20**) and the stack (**16**), and the stack and the support are held together by means of peripheral bolts (**24**) inserted in regions corresponding with the coplanar surfaces (**22**) of the support (**12**), perpendicular to these surfaces, and are screwed into the support, characterised in that before the bolts (**24**) are tightened, the stack (**16**) is clamped between the coplanar surfaces (**22**) on one side and thrust members (**52**) on the other side, said thrust members (**52**) being applied to the other end face of the stack (**16**) in regions also corresponding with the regions of insertion of the bolts (**24**), with clamping forces normal to the reference plane (P) and at least substantially equal to those predetermined tightening forces to be applied by the bolts on the stack, the bolts (**24**) are then tightened to apply said predetermined tightening forces on the stack and the clamping forces applied by the thrust members (**52**) are then released.

5,010,639

TRANSFER TOOL AND COVER-STRIP MAGAZINE FOR DRAWING COILS INTO STATORS OF ELECTRIC MOTORS

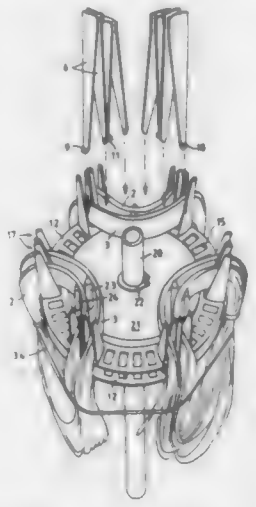
Franz Veser, Kanalstrasse 16, 7980 Ravensburg, Fed. Rep. of Germany

Filed Apr. 14, 1989, Ser. No. 337,946

Claims priority, application Fed. Rep. of Germany, Apr. 16, 1988, 3812726

Int. Cl.[5] H02K *15/06*

U.S. Cl. 29—734 **17 Claims**



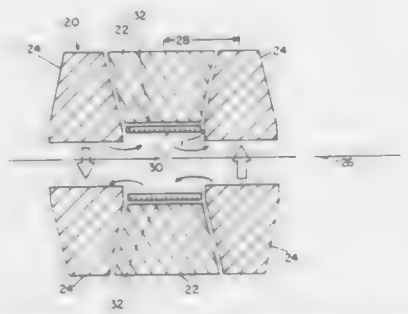
1. A transfer tool for transporting coils from a place of manufacture to a stator having a number of longitudinal grooves, divided into divisions, through which the coils are to be drawn, said transfer tool having a winding axis and comprising:

a carrier arrangement having means for receiving a tubular stem therethrough, said tubular stem receiving means being concentric with the winding axis, and a plurality of identically shaped receiving locations angularly disposed about its periphery;

transfer means for receiving coils in a flat shape with at least the sides of the coils being parallel to the winding axis, and

fastening means for releasably fastening said transfer means to receiving locations of the carrier arrangement wherein said fastened transfer means extend in the same axial direc-

tion as the tubular stem received in the receiving means, and the number and angular spacings of the receiving



locations correspond to the number of grooves and groove divisions of the stator.

METHOD FOR IMPROVING A WIGGLER

Stephen C. Gottschalk, Woodinville, Wash., assignor to Amoco Corporation, Chicatgo, Ill.

Filed Jul. 21, 1989, Ser. No. 383,743
Int. Cl.[5] H01F *7/06*
U.S. Cl. 29—602.1 5 Claims

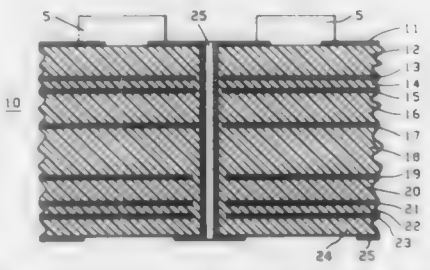
1. A method for producing an N-pole wiggler by modifying an existing N-pole wiggler, the modified N-pole wiggler having a desired longitudinal magnetic field, comprising the steps of:

(a) measuring the individual effect on the magnetic field of the existing N-pole wiggler of adding an individual shim of known thickness to a first of the N pole pieces of the existing N-pole wiggler;

(b) measuring the individual effects on the magnetic field of the existing N-pole wiggler of separately adding individual shims of known thickness to each of the remaining N pole pieces of the existing N-pole wiggler;

(c) computing the effect on the magnetic field of the existing N-pole wiggler of modifying the existing N-pole wiggler by simultaneously adding all of the shims to the corresponding N pole pieces of the wiggler;

(d) adjusting the thicknesses of the individual shims to minimize the difference between the magnetic field of the desired wiggler and the actual magnetic field of the modified wiggler; and



(e) adding shims having the desired thickness to the existing wiggler.

5,010,641

METHOD OF MAKING MULTILAYER PRINTED CIRCUIT BOARD

John R. Sisler, Scott's Valley, Calif., assignor to Unisys Corp. (Formerly Burroughs Corp.), Detroit, Mich.

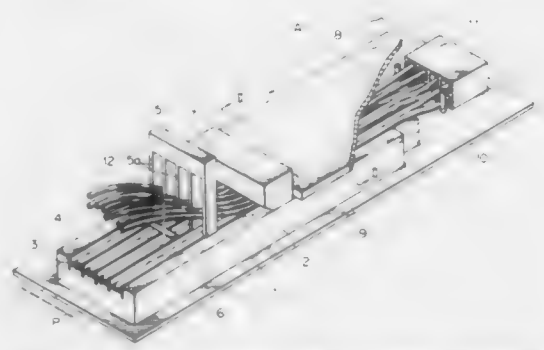
Filed Jun. 30, 1989, Ser. No. 374,118
Int. Cl.[5] H05K *3/36*
U.S. Cl. 29—830 10 Claims

1. A method of making a multilayer printed circuit board comprised of interleaved contiguous conductive and insulative dielectric layers, said method comprising:

providing a power-ground plane sandwich component comprised of a curable dielectric layer contiguously sandwiched between a conductive power plane layer and a conductive ground plane layer;

fully curing the dielectric layer of said sandwich component;

providing a single-trace component comprised of a circuit trace formed on a partially cured dielectric layer; assembling said components such that one side of said sandwich component is adjacent to and contiguous with the dielectric layer of said single-trace component; and



laminating said components to form said board, the dielectric layer of said single-trace component becoming fully cured by said laminating.

5,010,642

METHOD AND APPARATUS FOR MAKING A FLAT WIRING HARNESS

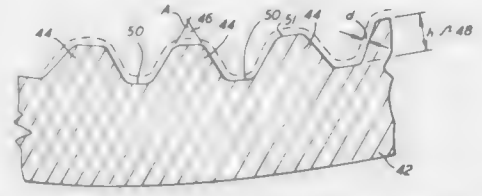
Mineo Takahashi; Susumu Nakayama; Osamu Yamashima; Satoshi Suzuki; Toshihiko Harada, and Keiji Aiso, all of Shizuoka, Japan, assignors to Yazaki Corporation, Tokyo, Japan

Filed Dec. 15, 1989, Ser. No. 450,968
Claims priority, application Japan, Dec. 27, 1988, 63-327959
Int. Cl.[5] H01R *43/00;* B23P *19/00*
U.S. Cl. 29—868 11 Claims

1. A method of making a flat wiring harness comprising the steps of:

unraveling intertwined wires by parallel arranged comb teeth;

pushing at least one smoothed-out wire into each straight wire accommodating groove in a grooved jig; and



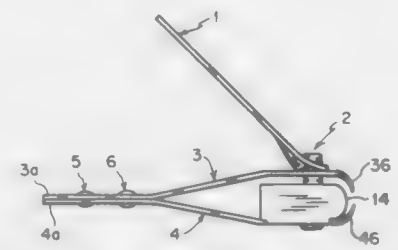
putting a cover on the grooved jig to maintain the laid wires in position.

5,010,643

HIGH PERFORMANCE HEAT TRANSFER TUBE FOR HEAT EXCHANGER

Steven R. Zohler, Manlius, N.Y., assignor to Carrier Corporation, Syracuse, N.Y.

Division of Ser. No. 244,294, Sep. 15, 1988, Pat. No. 4,938,282.
This application Jun. 21, 1990, Ser. No. 541,715
Int. Cl.[5] F28F *1/40*
U.S. Cl. 29—890.048 11 Claims



1. A method of making an internally ribbed heat transfer tube from a smooth-walled tubular metal workpiece by positioning the tubular workpiece on a generally cylindrical mandrel that has a plurality of helical grooves formed on its surface, and rolling a gang of discs over the exterior surface of the tubular workpiece above the mandrel so that the metal of the workpiece flows into the mandrel grooves to form said internal ribs at a given pitch, with said ribs having a predetermined height; wherein the improvement comprises forming said ribs so that the pitch thereof is on the order of 0.060 to 0.090 inches, and said ribs are formed with said predetermined height 0.015 to 0.030 times the inside diameter.

5,010,644

NAIL CLIPPING ENCOMPASSING CONTAINER TO RETAIN NAIL CLIPPINGS

Mahmut I. Goench, 77-68 270 St., New Hyde Park, N.Y. 11040

Filed Oct. 26, 1989, Ser. No. 409,021
Int. Cl.[5] A45D *29/00*
U.S. Cl. 30—28 4 Claims

1. A fingernail and toenail clipper comprising:

a longitudinal center-line;

an upper jaw having a first end and a second end;

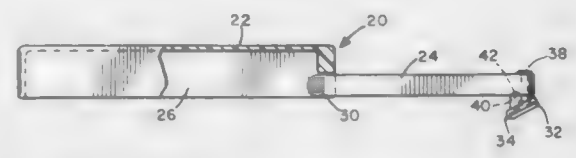
a lower jaw having a first end and a second end;

means for attaching said upper jaw at said first end to said lower jaw at said first end;

a main rivet for attaching said second end of said upper jaw a spaced distance above said second end of said lower jaw;

a nail clipping retaining box positioned beneath said second end of said upper jaw and integrally attached to and above said second end of said lower jaw, without being attached to the upper jaw, so that said retaining box is between said upper and lower jaws, said main rivet passing through said retaining box;

said retaining box comprising a first extension laterally attached along one side of the lower jaw second end, with said first extension having a back end comprising a first foldable flap portion, and a second extension laterally attached along the other side of the lower jaw second end, with said second extension having a back end comprising a second foldable flap portion; and



whereby said retaining box further comprises having each of the first extension and the second extension folded along each's laterally attached side, so as to be perpendicular to the lower jaw, but parallel to the longitudinal center line, and each extension having its back end foldable flap portion folded so as to be simultaneously perpendicular to the lower jaw and perpendicular to the longitudinal center-line, so as to complete the construction of the retaining box.

5,010,645

FOLDABLE T-SHAPED SHAVER

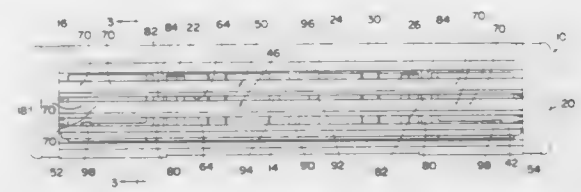
Hironori Furukawa, 11344 Tortuga St., Cypress, Calif. 90630

Filed Jan. 22, 1990, Ser. No. 468,178
Int. Cl.[5] B26B *21/00*
U.S. Cl. 30—47 5 Claims

1. A shaver comprising:

a grooved based stem having two ends;

an extension stem having two ends connected rotatably about a first axis at one said end thereof to one said end of said grooved base stem; and



a razor blade holder for holding a razor blade connected rotatably about a second axis perpendicular to said first axis to the other said end of said extension stem.

5,010,646

SHAVING SYSTEM

Nicolae Neamtu, Quincy, Mass., assignor to The Gillette Company, Boston, Mass.

Filed Jan. 26, 1990, Ser. No. 471,099
Int. Cl.[5] B26B *21/00, 19/44, 19/12*
U.S. Cl. 30—50 20 Claims

1. A razor blade member that has a first planar portion and a second planar portion, said second planar portion being angularly offset from said first planar portion and connected to said first planar portion by a transition region, the longitudinal edge of said first planar portion remote from said transition region being a cutting edge, and stress balancing deformation along the longitudinal length of said planar portions and adjacent said transition region.

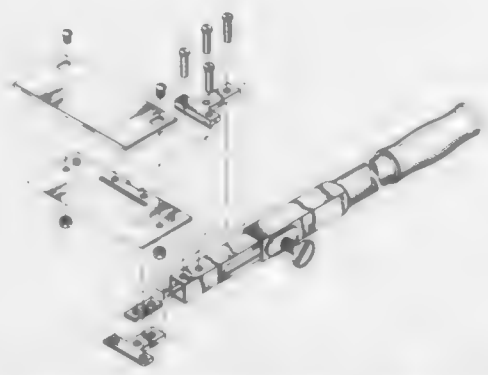
5,010,647

IMPACT SCRAPING TOOL FOR SCRAPING MATERIAL FROM SURFACES

Thomas C. Gray, 683 N. Fox, Flagstaff, Ariz. 86001

Filed Jul. 25, 1989, Ser. No. 385,284
Int. Cl.[5] B26B *3/00*
U.S. Cl. 30—169 8 Claims

1. An improved impact scraping tool for scraping material from surfaces, comprising:



(a) A ramming member having a longitudinal axis for transmitting thrust faces externally applied to said ramming member to said surface;

(b) A thrust member telescopically mounted to said ramming

member to permit slidable axial movement relative thereto;

(c) Barrier means carried by said ramming member for barring further axial movement of said ramming member relative to said thrust member such that the momentum of said ramming member is transferred to said thrust member upon said thrust member engaging said barrier means;

(d) a blade support plate carried by said thrust member having a laterally extending groove in its upper and under surfaces;

(e) A pair of clamp members having a laterally extending shoulder adapted for insertion into said lateral grooves where said clamp members are mounted to said thrust member; and

(f) A cutting blade removably mounted to said blade support plate such that upon application of an external thrust force to said ramming member said thrust member will engage said barrier means where upon the momentum of said ramming member is transferred to said thrust member thereby permitting said cutting blade to impact against said material surface.

5,010,648

GRAY HAIR CUTTER

Koichi Takigawa, Tokyo, Japan, assignor to Takigawa Kabushiki Kaisha, Tokyo, Japan

Filed Dec. 4, 1989, Ser. No. 445,559

Claims priority, application Japan, Feb. 27, 1989, 1-20303[U]

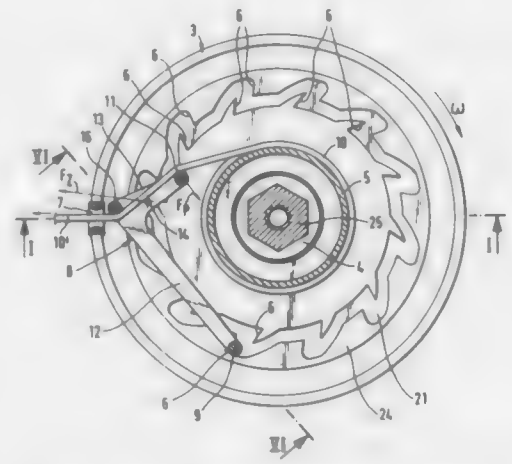
Int. Cl.[5] B26B *19/22, 29/00, 27/00;* **A45D** *29/00*

U.S. Cl. 30—195 **6 Claims**

1. A device for cutting gray hairs comprising a grip, and an operating member extending from said grip, said operating member including a generally hook-shaped end portion provided with an open slot therein having coplanar opposed facing surface portions defining an entrance therebetween for insertion of a hair to be cut, and a cutting edge extending along one of said surface portions of said slot in facing relation to the other of said surface portions and being disposed in the plane of said surface portions, said grip including a storage area and said operating member including means mounting said operating member for movement between a position within said storage area and an extended position away from said storage area.

5,010,649

CUTTERHEAD FOR A VEGETATION CUTTER APPARATUS



Joachim Hoffmann, Aichwald, Fed. Rep. of Germany, assignor to Andreas Stihl, Waiblingen, Fed. Rep. of Germany

Filed May 14, 1990, Ser. No. 522,782

Claims priority, application Fed. Rep. of Germany, May [redacted], 1989, 3916525

Int. Cl.[5] A01D *50/00*

U.S. Cl. 30—276 **10 Claims**

1. A cutterhead for a rotatably-driven vegetation cutter apparatus defining a drive axis about which the cutterhead is rotatably driven, the cutterhead comprising:

a housing adapted to be rotatably driven by the vegetation cutter apparatus about said axis;

said housing having a hub formed thereon so as to extend along said axis;

a spool carrying a flexible cutting filament wound thereon and being rotatably journalled on said hub;

said housing having a pass-through opening formed therein for passing the cutting filament to the outside;

indexing means for permitting an incremental rotation of said spool relative to said housing to pay out incremental lengths of the cutting filament, said indexing means including:

a blocking lever pivotally journalled in said housing and having first and second lever arms, said first lever arm having a switching arm formed thereon and said second lever arm having redirecting means formed thereon for guiding the cutting filament over said blocking lever while also defining a location at which a centripetal force is applied to said blocking lever by said filament;

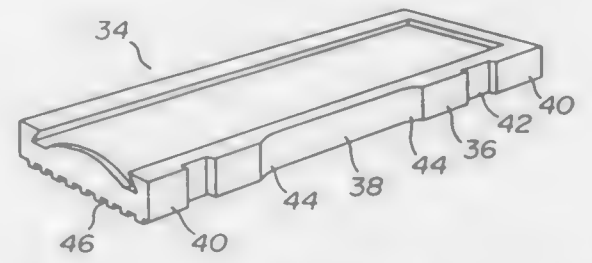
said redirecting means defining an open rounded surface for freely guiding said filament thereon so as to cause said filament to change direction and apply said centripetal force to said blocking lever at said rounded surface;

switching stop means formed on said spool for coacting with said switching arm;

said blocking lever being mounted in said housing so as to be movable between a blocking position where said switching arm coacts in dependence upon centrifugal force with said switching stop means to prevent a rotational movement of said spool with respect to said housing and a release position wherein said switching arm coacts in dependence upon centrifugal force with said switching stop means to release said spool for movement relative to said housing to pay out an incremental length of the filament; and,

said switching arm and said redirecting means being spaced at a peripheral distance from each other so as to cause said first lever arm to be longer than said second lever arm.

5,010,650



SEAM CUTTER

Maurice Despins, and William Carveth, both of Edmonton,, Canada, assignors to Omnimart Distributions Inc., Edmonton, Canada

Filed Sep. 2, 1988, Ser. No. 239,898

Int. Cl.[5] B26B *3/00*

U.S. Cl. 30—304 **18 Claims**

1. A cutter for cutting seams in overlapping upper and lower flooring materials, in which the edge of the upper flooring material is exposed, the cutter comprising:

a body having a handle defining an upper end of the body and having a forward longitudinal end and a rearward longitudinal end;

a base defining a lower end of the body and elongated in the longitudinal direction for supporting the body on one of the upper and lower overlapping flooring materials, and having a first guiding edge extending between the forward longitudinal end and the rearward longitudinal end of the body;

a foot connected to the body adjacent to the base for supporting the body on the other of the lower and upper flooring material and having a second guiding edge extending between the forward longitudinal end and rearward longitudinal end of the body;

a blade slidably disposed against the body between the foot and the base for cutting the flooring material;

one of the first and second guiding edges having a laterally recessed portion between the forward longitudinal end and the rearward longitudinal end of the body, so that the vertical edge of the upper flooring material does not contact the guiding edge in the recessed portion in use;

fastening means for fastening the blade at a chosen position in relation to the body.

5,010,651

PORTABLE CIRCULAR SAW

Ronald R. Techter, Lake Zurich; Gregg M. Mangialardi, Park Ridge, and Raymond R. Esparza, Chicago, all of Ill., assignors to Skil Corporation, Chicago, Ill.

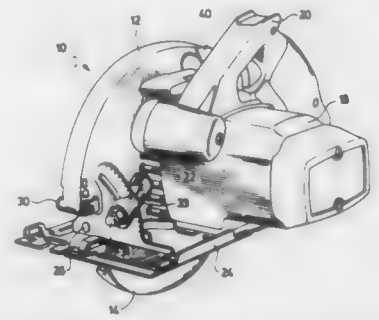
Filed Jul. 10, 1990, Ser. No. 550,839

Int. Cl.[5] B23D *51/02, 47/02, 50/00;* **B27C** *5/00*

U.S. Cl. 30—376 **8 Claims**

1. A circular saw for cutting 2X lumber at an angle of 60° with the vertical comprising:

a motor housing assembly;



a circular saw blade having a diameter of at least 8¼ inches attached to the saw blade with a blade bolt and washer;

a footplate having an opening therein for receiving the saw blade;

a front and a rear pivot point on said footplate and connected to said motor housing assembly for enabling said housing assembly and said attached saw blade to be rotated at least 60° from the vertical;

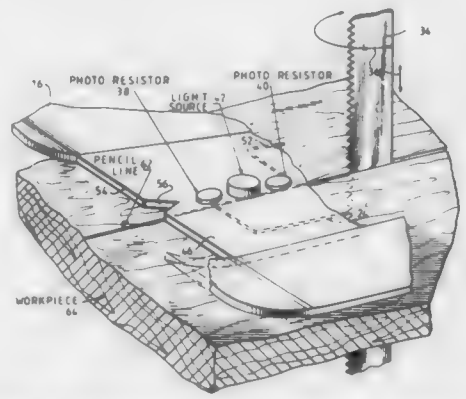
said front and rear pivot points having a height above the footplate such that, when supporting the guard in substantially the horizontal position, the distance of the lowest portion of the saw blade below the housing will have a vertical component sufficient to pass through 2X lumber when the blade is rotated 60°;

pivoting means coupled to one of the front and rear pivot points for enabling the depth of the saw extending below the footplate to be adjusted by pivoting the motor housing

assembly upwardly and downwardly about the pivoting means in the plane of the saw blade; and

a depth-of-cut bracket mounted on the footplate of the motor housing assembly at the end opposite the pivoting means and having indicia thereon to indicate the depth of cut when the housing is pivoted about the pivoting means to the position indicated, said bracket having 60° indicia thereon to indicate the proper pivot angle of the motor housing for a 60° cut.

5,010,652



OPTICALLY GUIDED POWER SABRE SAW

David J. Miletich, 8206 Mason Hill Rd., Woodstock, Ill. 60098

Filed Mar. 19, 1990, Ser. No. 495,105

Int. Cl.[5] B27B *19/04*

U.S. Cl. 30—393 **10 Claims**

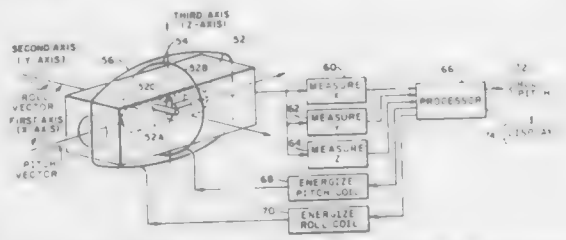
1. An optically guided power sabre saw using a penciled or an inscribed line to follow, comprising:

(a) a housing;

(b) a base plate attached to and displaced a distance from said housing, a right vertical support and a left vertical support both being disposed said distance and connecting said base plate to said housing;

(c) internal drift correcting means disposed internally to said housing and including a saw blade having reciprocating motion so that the penciled or inscribed line followed by said saw blade during the cutting process is automatically corrected; and

(d) external drift correcting means disposed externally to said housing and on said base plate and including a right photoresistor and a left photoresistor so that as said saw blade travels along said penciled or inscribed line, any drift off said penciled or inscribed line would be detected



by said right and said left photoresistors and instantly fed back to said blade drive motor for said saw blade correction.

5,010,653

APPARATUS AND METHOD FOR DETERMINING AZIMUTH, PITCH AND ROLL

John T. Fowler, Marblehead, Mass., assignor to Digicourse, Inc., Harahan, La.

Continuation of Ser. No. 162,007, Feb. 29, 1988, abandoned.
This application Oct. 20, 1989, Ser. No. 427,894
Int. Cl.[5] G01C *17/38, 17/28*
U.S. Cl. 33—356 **7 Claims**

1. A method of determining orientation relative to a reference frame having first, second and third mutually orthogonal axes comprising the steps of:

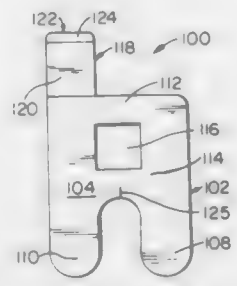
measuring the Earth's magnetic field to determine a first set of three substantially independent field components relative to said reference frame, including a first-axis component represented as Xe, a second-axis component represented as Ye and a third-axis component represented as Ze;

applying a first predetermined magnetic field along said second axis relative to said reference frame;

measuring a second set of three substantially independent composite field components relative to said reference frame, representing a composite magnetic field comprising the Earth's magnetic field and said first predetermined magnetic field, including a second first-axis component represented as Xr, a second second-axis component represented as Yr and a second third-axis component represented as Zr;

determining a value corresponding to azimuth according to the arctangent of (Ye/Xe);

determining a value corresponding to roll according to the arctangent of (Yr−Ye)/(Zr−Ze); and



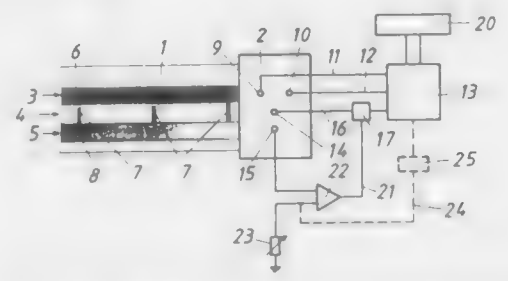
providing signals corresponding to the azimuth and roll.

5,010,654

TILE SPACER

Horacio C. Funes, Jr., Dunellen, N.J., assignor to Masonry Design Plus, Inc., Dunellen, N.J.

Filed Jan. 29, 1990, Ser. No. 471,536
Int. Cl.[5] G01B *5/14*
U.S. Cl. 33—526 **14 Claims**



1. A spacer comprising a flat body formed from a pair of spaced apart surfaces, one end of said body having said pair of spaced apart surfaces arranged parallel to each other to provide a portion of uniform thickness therebetween, said one end of said body including a pair of laterally spaced apart legs each of the same uniform thickness formed by said spaced apart surfaces, a first web formed from said body connecting said legs at one common end thereof, a second web formed from said body connecting said legs at a location spaced from said first web to provide an opening therebetween, and another end of said body having a surface arranged at an angle to one of said spaced apart surfaces to provide a portion of decreasing thickness therebetween.

5,010,655

INCREMENTAL MEASURING SYSTEM

Heinz Rieder, Oberndorf, and Max Schwaiger, Ostermiething, both of Austria, assignors to Sentop Rieder und Schwaiger Gesellschaft m.b.H., Tarsdorf, Austria

Filed Jan. 25, 1990, Ser. No. 470,110
Claims priority, application Austria, Feb. 9, 1989, 275/89
Int. Cl.[5] G01B *11/04*
U.S. Cl. 33—706 **21 Claims**

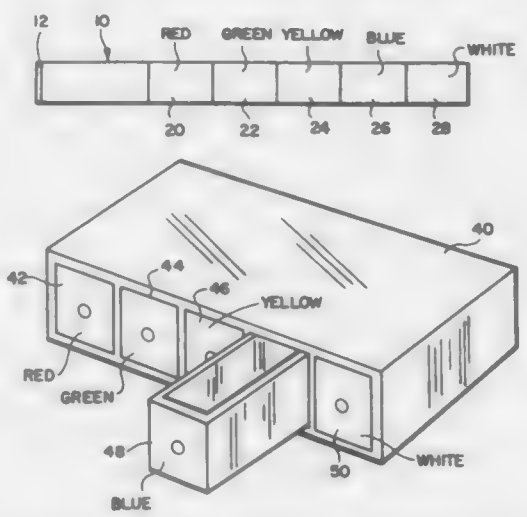
15. In a scale member for use in an incremental measuring system, which scale member is provided with an incremental scale, with a reference track, which is parallel to said scale and contains a plurality of reference marks associated with respective reference points, and a control track, which is parallel to said scale, wherein said scale and said reference track are adapted to be scanned by an optoelectronic scanning method, the improvement residing in that

said control track is adapted to be scanned by said optoelectronic scanning method and has portions which are disposed adjacent to respective ones of said reference marks and have different signal generating characteristics.

produced by a pattern which consists of discrete pattern elements and which varies along said scale in at least one of the parameters consisting of the pattern element density and pattern element size.

5,010,656

THERAPEUTIC APPARATUS



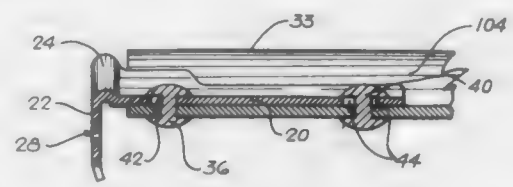
James B. Broselow, 24 White Eagle Ranch, Rte. 12, Hickory, N.C. 28602

Continuation of Ser. No. 197,592, May 23, 1988, abandoned, which is a continuation-in-part of Ser. No. 133,956, Dec. 17, 1987, Pat. No. 4,823,469, which is a continuation-in-part of Ser. No. 910,490, Sep. 23, 1986, Pat. No. 4,713,888, which is a continuation-in-part of Ser. No. 789,497, Oct. 21, 1985, abandoned. This application Oct. 9, 1990, Ser. No. 595,657
Int. Cl.[5] G01B *3/02*
U.S. Cl. 33—759 **10 Claims**

1. Apparatus for selection of emergency medical equipment and drug dosages for therapeutic treatment of a patient comprising:

(a) a measuring tape for measuring the heel-to-crown height of a patient, said measuring tape having coded zones representing a medical equipment of drug dosage indication along an effective length thereof; and

(b) a treatment dispenser having a plurality of sections containing emergency medical equipment and drugs, said dispenser sections being correspondingly coded to the measuring tape whereby a treatment administered using



the coding of the treatment dispenser is correlated to the heel-to-crown height of a paticnt as measured by the tape.

5,010,657

TAPE MEASURE END HOOK

Ralph E. Knapp, Barrie, Canada, assignor to Cooper Industries, Inc., Houston, Tex.

Filed Jun. 29, 1989, Ser. No. 374,039
Int. Cl.[5] G01B *3/10*
U.S. Cl. 33—770 **6 Claims**

1. An end hook adapted to be attached to a tape measure, said tape measure defining a longitudinal axis and adapted to be received in a housing, said end hook comprising:

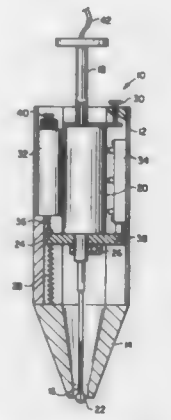
an abutting member having an inside surface and adapted to receive a force from said housing;

a tape attachment member attached to said abutting member and adapted to move along an axis substantially parallel to said longitudinal axis;

said tape attachment member defining first, second and third openings having first, second and third perimeters, respectively;

a reference point defined as a point of said third perimeter of said third opening located farthest from said abutting member;

first, second and third rivets attached to said tape measure and adapted to be received by said first, second and third openings, respectively; and



wherein said third rivet and said reference point define a gap when said inside surface receives a force from said housing substantially perpendicular to said inside surface such that said force is substantially absorbed by and substantially equally distributed between said first and second rivets.

5,010,658

HOLE PROFILE GAGING SYSTEMS

Jerry T. Griffith, Arlington, and Scott J. Pleva, Irving, both of Tex., assignors to LTV Aerospace and Defense Company, Dallas, Tex.

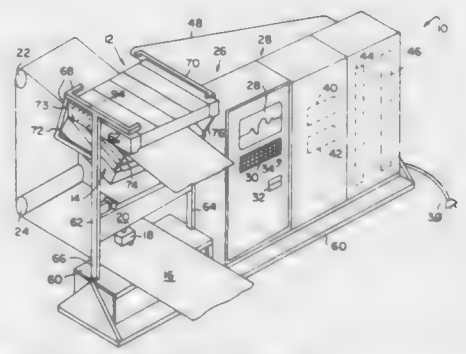
Filed Nov. 22, 1988, Ser. No. 274,985
Int. Cl.[5] G01B *5/20, 7/28*
U.S. Cl. 33—784 **30 Claims**

1. A hole profile gage comprising:

probe means for repeatedly sensing the contour of the inner surface of a hole as the probe means travels the length of the hole, and outputting a signal corresponding to the sensed contours;

extension means for extending said probe means into said hole;

retraction means including a dampener for retracting said probe means through said hole once the probe means are extended into said bore; and



processing means for receiving the signal output from said probe means and computing a profile of said hole.

5,010,659

INFRARED DRYING SYSTEM

Robert E. Treleven, Oneida, Wis., assignor to W.R. Grace & Co.-Conn., New York, N.Y.

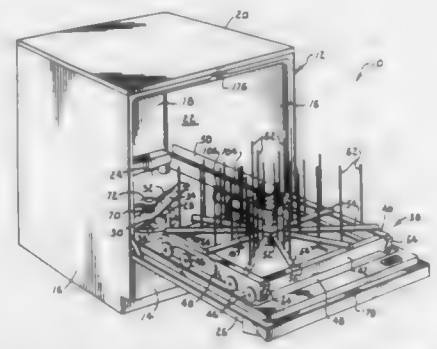
Filed Sep. 8, 1989, Ser. No. 104,895
Int. Cl.[5] F26B *3/32*
U.S. Cl. 34—41 **12 Claims**

1. Infrared drying system comprising:

a. traveling web of material and means for supporting said web;

b. sensing means supported above said web and traveling across the width of said web;

c. means for generating profile signals of the output of said sensing means across the width of said web with respect to a set point;



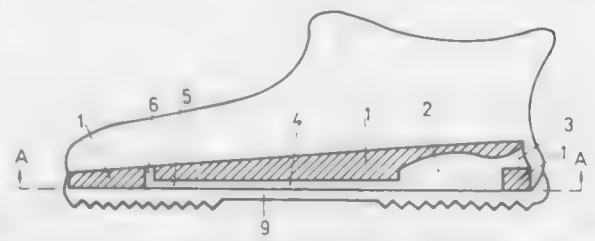
d. means for generating a plurality of control signals, for switching a power controller including storage means,

said storage means including an algorithm for switching power to an infrared lamp;
e. infrared module means positioned above said web in proximity to said sensing means; and,
f. power controllers connected between a source of power and each of said infrared lamps and to each of said control signals for controlling each of said infrared means.

5,010,660
METHOD AND APPARATUS FOR DRYING GLASSWARE

Larry G. Hambleton, Olathe, Kans.; Claude L. Sears, Liberty, and Elmer B. Offutt, Independence, both of Mo., assignors to Labconco Corporation, Kansas City, Mo.

Division of Ser. No. 92,898, Sep. 4, 1987, Pat. No. 4,820,351. This application Jan. 6, 1989, Ser. No. 293,956
Int. Cl.[5] F26B *13/30*
U.S. Cl. 34—92 **9 Claims**



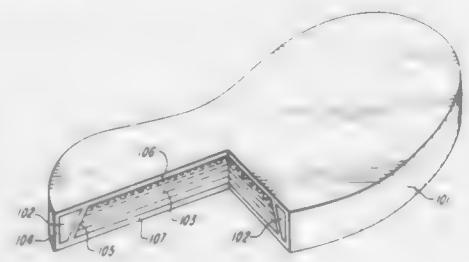
1. Apparatus for drying glassware articles each having an open top end, said apparatus comprising:
a housing presenting a substantially enclosed compartment;
a manifold coupled with said housing;
a plurality of generally horizontal conduits coupled with and extending radially outward from said manifold;
a plurality of generally vertical tubes coupled with each of said conduits, each of said tubes being adapted to receive a glassware article thereon in an inverted position with the open end of the tube located within the article; and
means for applying vacuum to said manifold to draw air from within said articles while air from the compartment enters said articles through the open top ends thereof to effect circulation of air within the articles to dry the insides of the articles.

5,010,661
UNIDIRECTIONAL AIRFLOW VENTILATING SHOE AND A UNIDIRECTIONAL AIRFLOW VENTILATING INSOLE FOR SHOES

Chi-kong Chu, 9/F, Block A, Man Hei Mansion, 2-12 Johston Rd., Wanchi, Hong Kong

Continuation of Ser. No. 280,542, Dec. 6, 1988, abandoned. This application May 2, 1990, Ser. No. 517,449
Claims priority, application Hong Kong, Dec. 7, 1987, 87107387
Int. Cl.[5] A43B *7/06, 13/38*
U.S. Cl. 36—3 B **11 Claims**

1. A unidirectional airflow ventilating shoe comprising an upper part, a sole, and a unidirectional airflow ventilating layer provided inside the shoe on the sole, wherein the ventilating layer having a heel portion and a fore part and including a compressible cavity at the bottom surface in the heel portion of the layer; said heel portion having a substantially vertical back wall portion in which an air inlet opening to the rear area of the shoe resides in such a manner that when force is applied to the heel portion of the layer, the air inlet is closed as a result of the back wall collapsing; and an elastic main airflow passage at the front of the cavity leading to the fore part of the layer, the fore end of the main airflow passage being divided into a plurality



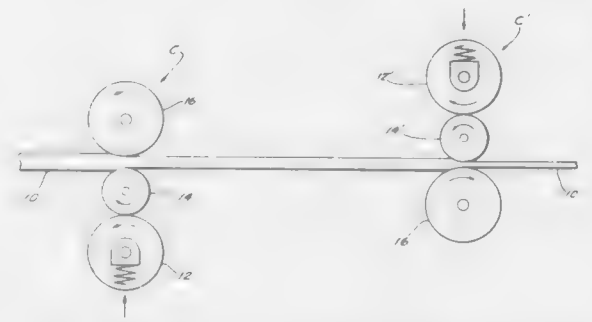
of branches, the fore end of each branch being provided with an air outlet leading to the upper surface of the layer.

5,010,662
SOLE FOR REACTIVE DISTRIBUTION OF STRESS ON THE FOOT

Leonid V. Dabuzhsky, 86 High Rock Ter., Newton, Mass. 02167, and Moisey M. Lerner, 75 Rolling La., Needham, Mass. 02192

Continuation of Ser. No. 138,957, Dec. 29, 1987, which is a continuation-in-part of Ser. No. 106,152, Oct. 8, 1987, abandoned. This application Apr. 12, 1990, Ser. No. 509,418
Int. Cl.[5] A43B *13/20*
U.S. Cl. 36—28 **8 Claims**

1. A sole comprising:
a case for placement between the foot and ground having
a top portion for location of said case against the plantar portion of the foot;
a bottom portion spaced apart from said top portion for location of said case against the ground;
an outer wall for connecting said top portion to said bottom portion and encompassing space therebetween;
an inner wall for connecting said top portion to said bottom portion and for defining therebetween and within said outer wall at least one chamber containing air and at least on chamber containing liquid, said inner wall comprised of resilient material sufficiently elastic for providing communication of pressure between said at least one chamber containing air and said at least one chamber containing liquid; and
said at least one chamber containing liquid being defined by a ceiling of surface area S_1 and a floor of surface area S_2 greater than S_1.



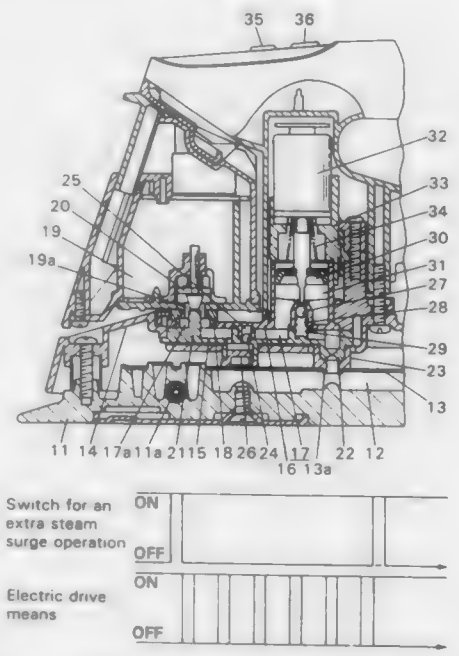
5,010,663
LOW PERMEABILITY FABRIC AND METHOD OF MAKING SAME

Peter B. Thornton, Bronxville; Stanley H. Cone, and George W. Booz, both of Hornell, all of N.Y., assignors to Stern & Stern Industries, Inc., New York, N.Y.

Division of Ser. No. 264,158, Oct. 28, 1988, Pat. No. 4,977,016. This application Jun. 26, 1990, Ser. No. 544,127
Int. Cl.[5] D03D *1/00;* **B60R** *21/16;* **D06F** *61/02*
U.S. Cl. 38—52 **10 Claims**

1. A method of making a strong, lightweight, thin, flexible fabric of low permeability comprising the steps of:

(A) providing an uncoated, woven, strong, lightweight, thin, flexible cloth of high permeability; and
(B) calendering the cloth on both sides without thermal

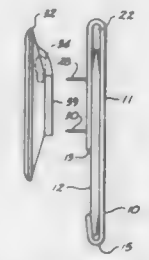


degradation to reduce the permeability to not more than three cubic feet of air per minute per square foot of cloth (1.5 $cm^3/sec/cm^2$) at a pressure drop of 0.5 inch of water (1.27 cm) across the cloth.

5,010,664
STEAM IRON HAVING A SOLLENOID DRIVEN PUMP AND HEATED EVAPORATION CHAMBER FOR PROVIDING STEAM AND OPERABLE FOR FURTHER PROVIDING EXTRA STEAM AT SPECIFIED INTERVALS

Chikashi Sakano, Yao; Selichi Nakada, Sanda; Masao Shimizu, Nishinomiya; Shinichi Ito, Kobe, and Toshiyoshi Yamamoto, Ibaraki, all of Japan, assignors to Matsushita Electric Industrial Co., Ltd., Osaka, Japan

Filed Nov. 16, 1989, Ser. No. 438,387
Claims priority, application Japan, Nov. 18, 1988, 63-292708; Nov. 18, 1988, 63-292710; Nov. 18, 1988, 63-292736
Int. Cl.[5] D06F *75/00, 75/10, 75/14, 75/20*
U.S. Cl. 38—77.7 **9 Claims**

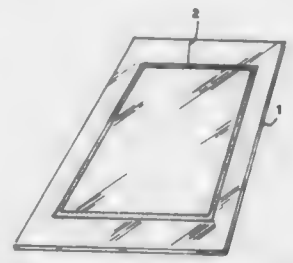


1. A steam iron comprising a soleplate to be heated by a heater, a fluid evaporation chamber disposed upon the soleplate for generating steam therein, a tank located above the evaporation chamber, and an electric drive means for delivering water from the tank to the evaporation chamber, wherein said electric drive means is driven at specified intervals so as to generate extra steam.

5,010,665
MODULAR ELECTRONIC BADGE

Cornell Clinkscales, 105 Catlin Cir., Greenville, S.C. 29607

Filed Apr. 3, 1986, Ser. No. 847,511
Int. Cl.[5] A44C *3/00*
U.S. Cl. 40—1.5 **9 Claims**



1. A battery-operated electronic apparatus, comprising:
a first housing having electronic circuitry protectively enclosed therein, said first housing defining a chamber which opens to the exterior of said first housing, and which is adapted to receive a battery, said first housing further including an engagement member integral therewith for retaining a battery within said chamber slidably introduced thereto; and
a second housing having an electrical load enclosed therein, said second housing being removably supported on and electrically associated with said first housing, whereby said electrical load may be driven by said electronic circuitry when said is powered by a battery received in said chamber; wherein
said chamber includes contact means for electrically engaging a battery retained therein by said engagement member, receipt of which automatically provides power to said electronic circuitry as such battery is slidably situated relative said engagement member.

CUSHIONED FRAMED ARTICLE

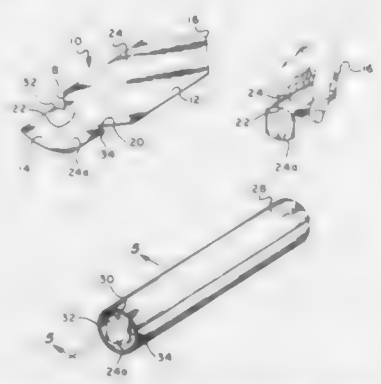
Carlos Robles, Lomas Vista Hermosa, Mexico, assignor to Plasticos Cream, S.A., Mexico

Filed May 18, 1987, Ser. No. 51,540
Claims priority, application Mexico, May 26, 1986, 2500
Int. Cl.[5] A47G *1/06;* **G09F** *1/12*
U.S. Cl. 40—154 **5 Claims**

1. A cushioned frame for a generally planar article, comprising:
a bottom layer of heat-sealable material having edges,
a relatively rigid base of material having first and second sides, said first side having heat sealable adhesive stripes thereon defining a section to be framed,
a layer of foam material secured to said base by the adhesive stripes and having substantially the configuration and size of the base,
an upper layer of heat-sealable material sealed along its edge

portions to edge portions of the bottom layer of heat-sealable material to enclose the layer of foam material between the upper and lower layers of heat-sealable material, and

a layer of transparent or translucent heat-sealable material sized and configurated to fit in the section defined by said adhesive stripes, and disposed over the upper layer of heat-sealable material, secured thereto by depressed heat-seal stripes and cooperating with the upper layer to define an envelope to receive said picture,



the layer of foam material being compressed at the heat-seal stripes which bond together the sheet of transparent or translucent material, the upper layer of heat-sealable material and the layer of foam material, thereby defining a raised bas-relief framing portion outwardly of the depressed seal stripes and a framed cushioned section.

5,010,667

IDENTIFICATION TAG FOR ROLLED DRAWINGS

Herman A. Hassinger, 282 Chester Ave., Moorestown, N.J. 08057

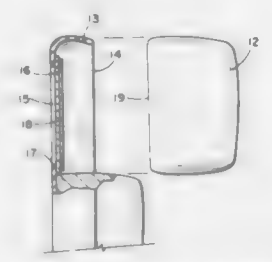
Filed Jun. 28, 1989, Ser. No. 372,571
Int. Cl.[5] G09F *3/00*
U.S. Cl. 40—309 **5 Claims**

1. An identification tag for identifying rolled documents such as architectural or engineering drawings or the like that are normally rolled into cylindrical form with the sheets thereof forming a spiral and wherein said rolled documents are normally stacked upon each other or stored in a rack with only their ends exposed, said tag comprising:

an elongated strip of substantially planar sheet material, said material being of a thickness and composition so as to be rigid enough to substantially sustain its shape but flexible enough so that it can be easily flexed by a person's hand, said strip being divided into a holding portion at one end thereof and a tag portion at the other, said holding portion and said tag portion being integral with each other;

a transition portion lying between said holding and tag portions, said transition portion including a score line across the width of said strip, said score line being arcuately shaped with the center portion of said line being in the direction of said holding portion;

the width of said transition portion being less than the width of said tag portion and less than the width of the main section of said holding portion, the width of said transition portion being narrowest at said score line and tapering outwardly to said tag portion at one end thereof and to said holding portion at the other end;



whereby when the side edges of said holding portion are flexed downwardly to curve said holding portion into the shape of a rolled document, the tag portion can be bent downwardly where it substantially retains its planar shape and also remains in a position which is substantially perpendicular to the axis of said holding portion, the upper edge of said tag portion adjacent said transition portion, however, being concavely curved.

5,010,668

ADVERTISING DEVICE FOR AIRLINER SEAT BACK OR SNACK TRAY TABLE

Stephen J. Zeligson, 1815 E. 31st Pl., Tulsa County, Okla. 74105

Filed Feb. 28, 1989, Ser. No. 317,024
Int. Cl.[5] G09F *3/00*
U.S. Cl. 40—324 **14 Claims**

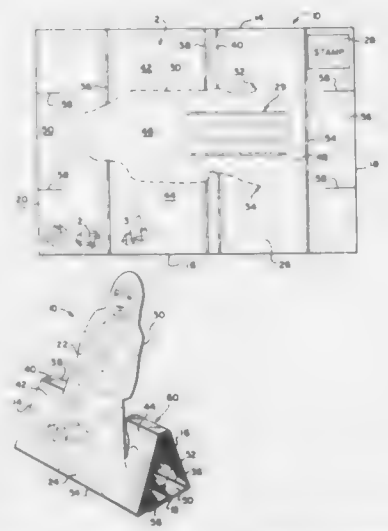
1. In airliner passenger seats having cushions supported by a seat back having a continuous smooth-flowing gradual contour along substantially the entire back surface thereof, an improvement facilitating the display of replaceable printed or pictorial materials for viewing by passengers seated rearwardly of the displaying seat comprising:

a window having a perimeter disposed in and conforming to said contour of said seat back;

a transparent window pane shaped to overlap said perimeter of said window;

means for securing said pane to the interior of said seat back with said window pane disposed to conform to said contour of said seatback in overlapping relationship to said perimeter;

means permitting the removable insertion of said printed or pictorial materials in face-to-face relationship with said pane, and



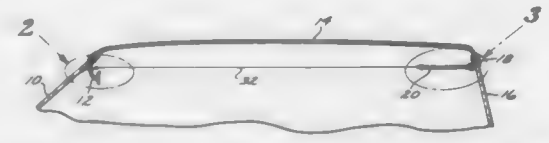
means for holding said printed or pictorial materials in said face-to-face relationship.

5,010,669

POST CARD WITH POP-OUT FIGURE

George Moran, 800 Electric Ave., Seal Beach, Calif. 90740

Filed May 22, 1989, Ser. No. 354,101
Int. Cl.[5] G09F *1/08*
U.S. Cl. 40—539 **16 Claims**



1. A mailing card comprising a single rectangular planar, sheet of only a single thickness of card stock having a face and an opposite obverse surface, a pair of straight mutually parallel longitudinal edges and a pair of straight mutually parallel transverse edges perpendicular to said longitudinal edges, a figure printed on said face of said card stock, a perforated outline formed as a frangible tear line on said card stock extending entirely through the thickness of said card stock and circumscribing a portion of said figure and terminating at both ends proximate to a selected one of said edges such that said portion of said figure is separable along said frangible tear line from the surrounding areas of said card stock adjacent said perforated outline to leave an opening therebehind in the shape of said portion of said figure extending entirely through the thickness of said card stock, a plurality of mutually parallel lines of weakness defined on said card stock extending parallel to said selected one of said edges, wherein at least one of said lines of weakness is discontinuous and is defined on said card stock and extends to said perforated outline from said edges of said card that are perpendicular to said selected one of said edges, thereby defining a gap in said line of weakness that extends across said figure and an indicia of placement of a postage stamp near one corner of said card stock on said obverse surface.

5,010,670

AUTOMOBILE WINDOW DISPLAY APPARATUS

Mario J. Minervini, 3192 Blackwell Dr., Vista, Calif. 92084

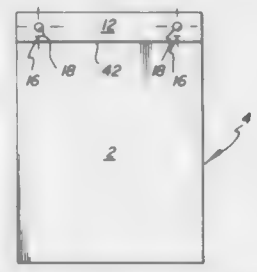
Filed Dec. 14, 1989, Ser. No. 451,456
Int. Cl.[5] G09F *21/04*
U.S. Cl. 40—593 **3 Claims**

1. In combination with an automobile having a rear window, a windshield, rear structure adjacent the rear window, and a rear view mirror mount adjacent the windshield, improved window display apparatus comprising:

a display panel for carrying a message, the panel being adapted to move between a substantially horizontal retracted position and a substantially vertical display position in which the message is visible from outside the automobile through the rear window;

hinge means pivotally mounting the upper extremity of the panel to the rear structure; and

an elongated flexible element mounted at its rearward end to the lower extremity of the panel, and including mounting means comprising a hook at the forward end of the flexible element attachable to the rear view mirror mount, the forward end of the flexible element being graspable by a user for demounting the hook from the rear view mirror mount, and for rearward movement with the user's hand to rearwardly move the flexible element and permit the display panel to pivot from the retracted position to the display position.



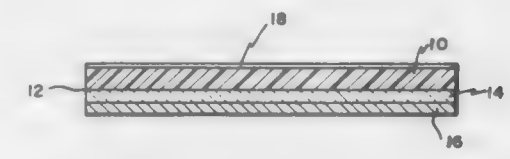
5,010,671

FLIP CHART PAD

David R. Stonehouse, Mississauga, Canada, assignor to Dennison Stationery Products Company, Milford, Mass.

Continuation of Ser. No. 121,794, Nov. 13, 1987, abandoned. This application Jul. 19, 1989, Ser. No. 381,831
Int. Cl.[5] G09F *7/12*
U.S. Cl. 40—594 **26 Claims**

1. In a flip-chart pad comprising a plurality of overlying tear sheets releaseably attracted to one another by means of static cling so as to define said pad, each said sheet adapted for writing thereon and for dry erasure of said writing for reuse of said sheet, and each said sheet being removeable from said pad



for releaseable securement to a surface solely by means of static cling.

5,010,672

LAMINATED SIGN

Kelly R. Coleman, 516 Belle Isle Ave., Belleair Beach, Fla. 34635

Filed Feb. 29, 1988, Ser. No. 161,688
Int. Cl.[5] G09F *19/00*
U.S. Cl. 40—615 **7 Claims**

1. A sign which comprises:

a flexible facing including a first and a second surface and having an overall dimension of said sign;

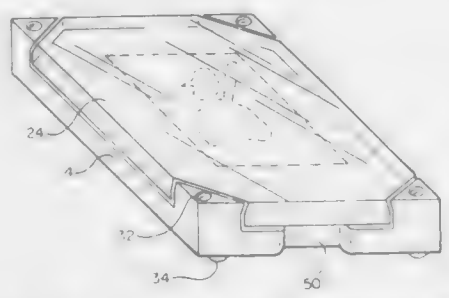
a thin flexible sheet having a first side and a second side, graphics applied onto said second side of said thin flexible sheet, said first side of said thin flexible sheet being secured onto said second surface of said flexible facing by adhesive means; and

a protective covering backing sheet of thin vinyl including a first surface and a second surface, said first surface of said protective backing sheet being applied over said thin flexible sheet and secured to said second side of said thin flexible sheet and a secured to a portion of said second surface of said flexible facing by adhesive means to protect said graphics, whereupon said sign may be installed in a special frame allowing said graphics to be viewed only through said first side of said flexible facing, and a protective coating of a material applied onto said first surface of said facing which blocks ultraviolet light, whereby ultraviolet light that is harmful to graphics will pass through at least two thicknesses of material for protection of said graphics from the ultraviolet light.

5,010,673

PLASTIC CARD HOLDER

John K. Connor; Charles M. Connor, Jr., and H. B. Stroup, Jr., all of Asheville, N.C., assignors to Collectors Products Corporation, Asheville, N.C.



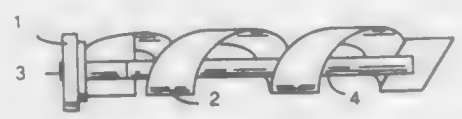
Filed Jul. 7, 1989, Ser. No. 376,816
Int. Cl.[5] G09F *3/18*
U.S. Cl. 40—661 **22 Claims**

16. A plastic holder for receiving and containing a display item, comprising:

(a) a generally rectangular clear base panel having a top surface and a bottom surface and a surface area greater than that of the display item, the top surface having a recess therein for containing the display item and a plural-

ity of flanges extending upwardly from the top surface of the base panel at each corner thereof;

(b) a separate clear insert panel having a top surface and a flat bottom surface and a surface area greater than that of the display item, and having notches about a periphery of the insert panel in positions corresponding to the flanges on the top surface of the base panel adapted for mating with the flanges of the base panel; and



(c) said flanges and said notches providing a means for securing the insert panel to the base panel, wherein each of said flanges is provided with a recess, each of the notches of said insert panel being provided with a horizontally protruding rim, the rim of said insert panel mating with the recess of said flange when the holder is assembled, said insert panel being adapted for engagement with said base panel by manual pressure.

5,010,674

SPRING ACTUATED SAFETY CARTRIDGE

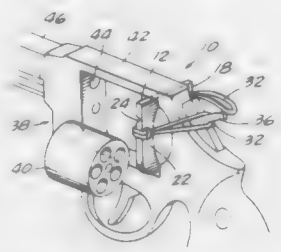
Don Horton, 5902 Kirkwood Pl. N., Seattle, Wash. 98103

Filed Aug. 31, 1989, Ser. No. 401,098
Int. Cl.[5] F41A *17/00*
U.S. Cl. 42—70.11 **3 Claims**

1. A cartridge, to be inserted into a gun having a chamber and a firing pin, comprising:

(a) a spring of a diameter that fits into the chamber of the gun when compressed but would expand into tight engagement if unwound;

(b) means to hold the spring in a compressed state; and



(c) means for the firing pin to release the means holding the spring in a compressed state.

5,010,675

FIRE PIN SHIELD

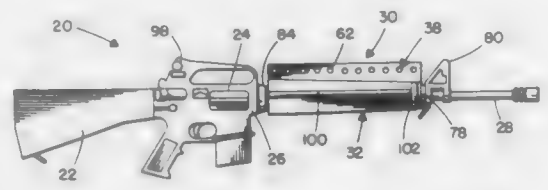
Albert B. Selleck, 2000 Palmira Dr., Reno, Nev. 89511

Filed Feb. 29, 1990, Ser. No. 483,373
Int. Cl.[5] F41A *17/64*
U.S. Cl. 42—70.11 **8 Claims**

1. A firing pin shield to protect the firing pin and working mechanism of both small and large revolvers during cleaning of the bore of a revolver's barrel with the revolver cylinder moved away from the revolver's frame, comprising:

a shield member made from material impervious to cleaning oils, solvents, and lubricants, and having a polygonal shape with a front surface and a rear surface and a top and a bottom;

an indentation formed in said front surface of said shield member and located in parallel relationship and close proximity to said top of said shield member; and



means for securing said shield member to the breech face of a revolver when the cylinder of said revolver is moved away from said revolver's frame.

5,010,676

HAND GUARD FOR FIREARMS

Paul G. Kennedy, East Hartford, Conn., assignor to CFPI Inc., Wilmington, Del.

Filed Mar. 21, 1989, Ser. No. 497,128
Int. Cl.[5] F41C *23/16*
U.S. Cl. 42—71.010 **21 Claims**

1. A hand guard for the barrel of a firearm comprising:

an elongated housing adapted to be mounted on the barrel for encapsulating a predetermined length of the barrel and defining a convection chamber therein;

said housing having a longitudinal axis substantially aligned with the longitudinal axis of the barrel;

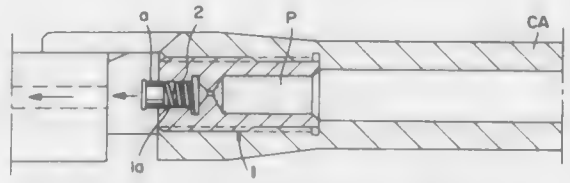
said housing being generally of pear-shaped cross section having a broadened, flattened, bottom member, a narrow, tall chimney member with a pair of spaced substantially vertically disposed sidewalls, and a transversely extending bridge member joining said sidewalls, and opposed connecting members uniting said bottom member and said sidewalls;

said housing having a plurality of longitudinally spaced inlet ports formed in said bottom member and a plurality of longitudinally spaced exhaust ports in each of said sidewalls;

whereby heat from the barrel of the firearm creates convection currents in said convection chamber which draw ambient air into said convection chamber through the inlet ports, around the barrel, and out through the exhaust ports, thereby cooling the barrel and directing the heated air away from said bridge member.

5,010,677

PLUG FOR SHOTGUN OR RIFLE BARREL USING BLACK POWDER



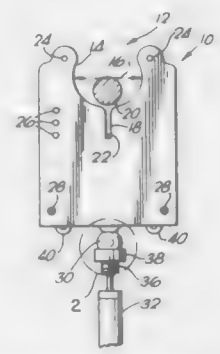
Claude Verney Carron, 23 Ter rue Emile Clermont, 42100 Saint Etienne, France

Filed Mar. 8, 1990, Ser. No. 490,343
Claims priority, application France, Dec. 20, 1989, 89 17523
Int. Cl.[5] F41A *21/10*
U.S. Cl. 42—77 **4 Claims**

1. A plug for a barrel of a fireman, said firearm using black powder and a primer to ignite the black podwer, comprising:

a plug configured for mating engagement with the barrel of the firearm, said plug including a powder chamber adapted to receive the black powder, a primer chamber adapted to receive the primer, and a passageway communicating between the primer chamber and the powder chamber; and,

an elastic component housed within the the primer chamber for bearing outwardly on the primer, said elastic component dimensioned to allow at least partial introduction of said primer into the primer chamber, full introduction of the primer into the primer chamber upon closing the



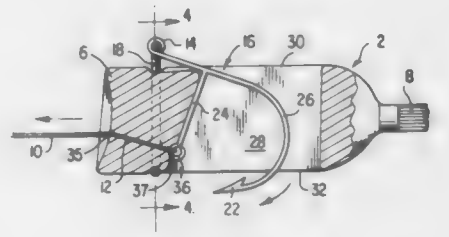
firearm, and at least partial projection of the primer from within the primer chamber upon opening the firearm, wherein said elastic component makes direct surface contact with said primer.

5,010,678

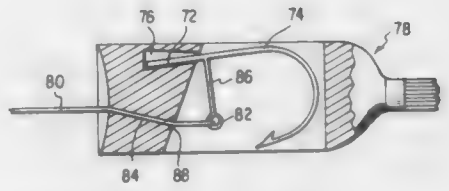
BITE INDICATOR

Jeffrey A. Peck, 53 Thackery Road, Larkfield, England, and William R. Thurston, 15 Harold Road, Hawley, Dartford, England DA2 7SA

Filed May 19, 1989, Ser. No. 354,130
Claims priority, application United Kingdom, Jan. 19, 1989, 8901170
Int. Cl.[5] A01K *97/12*
U.S. Cl. 43—17 **18 Claims**



1. A fishing bite indicator including means for guiding a fishing line along a path in which it runs in abutment with a sensor operable to generate or modulate an output when moved, means for monitoring the output of the sensor and generating an audible and/or visual indication upon generation or modulation of an electrical signal by said sensor, wherein the sensor comprises a sensing device operable to generate or modulate a voltage when it is moved or vibrated and which is mounted in a sealed casing shaped to support a fishing rod and is provided with a stylus passing through a water resistant or water impermeable sheath to a position in which it abuts in use a fishing line such that movement of the fishing line will cause movement of the stylus, wherein said casing has an opening within which in use a fishing rod rests, the opening comprises a mouth part of a first width through which the rod may pass, a second part of width greater than said first width within which in use the rod rests, and a slot part of width less than said first width which receives the line associated with the rod and within which said stylus extends, the walls of said slot part being shaped to guide the fishing line into a path in which its abuts the stylus, the indicator further including a freely rotatably mounted cam member located and positioned to engage the fishing line and in use be rotated thereby when the fishing line moves, said cam member being positioned further to engage and cause movement of the stylus when the cam member is rotated.



5,010,679

FISHING LURE AND FISH HOOK

Michael M. Tischer, 725 N. West St., Dover, Del. 19901

Filed Jan. 5, 1990, Ser. No. 461,291
Int. Cl.[5] A01K *85/00*
U.S. Cl. 43—42.04 **13 Claims**

1. A weedless fishing lure comprising:

an elongated body including a forward end, a rearward end and an intermediate portion joined at one end to the forward end and joined at the other end to the rearward end, and a fish hook including a first end portion, a second end portion comprising a barbed point, and a shank portion therebetween, wherein said lure body comprises:

slot means for receiving the fish hook extending through said intermediate portion, said slot means comprising elongated openings on opposite sides of said intermediate portion;

channel means communicating with said slot means extending through said forward end and through a leading surface of the slot means, for receiving an elongated line, wherein said elongated line is attached to said fish hook at one end and extends through said channel means for connecting to a fishing rod; and

resilient means extending around an outer perimeter of said lure body for retaining the first end portion of the fish hook outside the lure body adjacent one of said elongated openings;

whereby tension on the line causes rotation of the fish hook in said slot means to expose the barbed point through the other of said elongated openings in the intermediate portion of said lure.

5,010,680

FISH HOOK EXTRACTION DEVICE

Robert C. Lytle, 529 13th St., Manhattan Beach, Calif. 90266

Filed Aug. 20, 1990, Ser. No. 569,718
Int. Cl.[5] A01K *97/00*
U.S. Cl. 43—53.5 **7 Claims**

1. A hook extraction device comprising:

an upper portion,

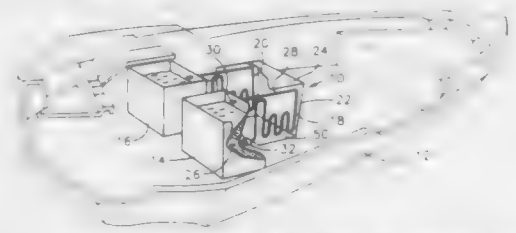
a lower portion pivotably secured to said upper portion,

a first line having two ends, one end being secured to said upper portion,

a second line having two ends, one end being secured to said upper portion,

a hook eye nest secured to the other end of said first line, said hook eye nest being adapted to surround a hook eye of a hook located in a person, and

a loop formed at the other end of said second line adapted to be secured to a bend of a hook located in a person so that



upon pivoting of said upper portion with respect to said lower portion said first line is moved to move said hook

eye nest to unseat a barb of the hook and said second line is moved to extract the hook from a finger of a person.

5,010,681
COOLER FOR LIVE WELL WITH RECIRCULATED WATER

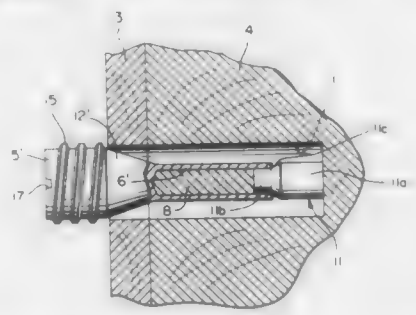
Robert A. Cox, Jr., Rte. 80, Box 980, Camdenton, Mo. 65020
Filed Jul. 30, 1990, Ser. No. 559,611
Int. Cl.[5] A01K *97/00*
U.S. Cl. 43—57 **10 Claims**

1. A cooler and aerator for live wells and storage chest for items to be cooled, said cooler comprising an ice chest having an open central area for receiving ice and said items to be cooled, a cooling coil in said ice chest having an inlet receiving water from a live well and an outlet communicating with an aerating means for discharging cooled aerated water into said live well, means for circulating water from said live well through said coil and aerating means, means for supporting said coil adjacent an interior side wall of said ice chest, said means comprising a protective rigid baffle substantially covering said coil, said baffle being supported with respect to said coil and said interior wall to provide for free circulation of ice water from said open central area past said coil, said coil being supported in sandwich relation between said interior side wall and the baffle.

5,010,682
ANIMAL TRAP

Gino Saccon, 1625 Kent/Des-Moines Rd., Seattle, Wash. 98188
Filed Jul. 24, 1990, Ser. No. 557,189
Int. Cl.[5] A01M *23/30*
U.S. Cl. 43—81 **2 Claims**

1. An animal trap, comprising:
a spring means;
first and second arm members extending from said spring means to outward ends, said outward ends being biased apart by said spring means;
a loop portion on said first arm member positioned to substantially encircle the outward end of said second arm member;
a jaw portion on said second arm member positioned to be biased toward a side of said loop portion opposite said first arm member; and
a trigger member movably carried by said first arm member, said trigger member including a paddle portion and a detent portion;
said paddle portion positionable in substantial axial alignment with said loop portion when said detent portion is positioned to hold the outward end of said second arm member in a position relatively adjacent the outward end of said first arm member with stored spring energy such that movement of said trigger member will release the outward end of said second arm member causing the jaw

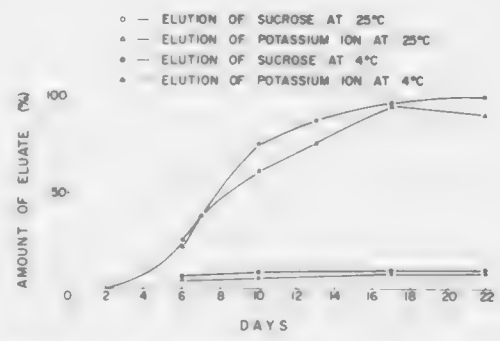


portion to be moved by said spring means across said loop portion toward said side opposite said first arm member to forcefully clamp the animal within said loop portion;
wherein said jaw portion includes a longitudinal split substantially along a longitudinal plane in said outward end of said second arm member and portions on each side of said split being bent apart radially outwardly in a shear direction substantially parallel to said plane.

5,010,683

Patent Not Issued For This Number

5,010,684
TREE TREATMENT CAPSULE

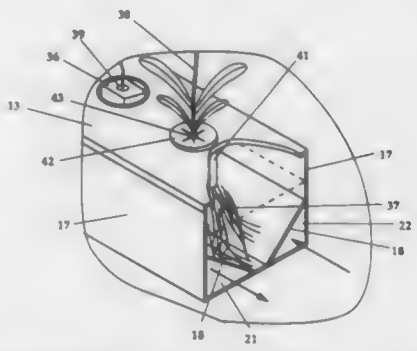


Hans Merving, Bergius vag 4, S-644 00, Torshälla, Sweden, assignor to Hans Merving, Torshalle, Sweden
Continuation-in-part of Ser. No. 393,841, Aug. 7, 1989, Pat. No. 4,905,410, which is a continuation of Ser. No. 184,072, Apr. 20, 1988, abandoned. This application Sep. 22, 1989, Ser. No. 410,884
Claims priority, application Sweden, Apr. 24, 1987, 8701680
The portion of the term of this patent subsequent to Mar. 6, 2007, has been disclaimed.
Int. Cl.[5] A01G *29/00*
U.S. Cl. 47—57.5 **17 Claims**

1. A tree treatment capsule for insertion into a bore in a tree comprising:
a head element.
a shank portion of smaller diameter integrally formed with said head element by a tapered portion, said shank portion having an internal cavity,
a chemical agent for treating a tree disposed in said internal cavity;
said shank portion having an end remote from said head element, said end having an opening for said internal cavity,
a tapered plug sealingly closing said opening,
said plug being tapered from a diameter larger than the diameter of said opening to a diameter smaller than the diameter of said opening such that said plug is only partially insertable into said opening in order to obtain a tight fit between said plug and said opening,
said head element, said shank portion, said chemical agent and said plug forming a self-contained capsule which is insertable as a unit into a bore in a tree having a diameter greater than the diameter of the shank portion and a length shorter than the length of the capsule so that when inserted into the tree, said plug abuts an end wall of the bore, said shank portion being frangible so that when a force is applied to said head element to move said shank portion towards said plug, said plug expands said opening and breaks said shank portion to enable the chemical agent to pass out of the shank portion into an annular space defined between the shank portion and the bore to mix with the tree sap, said capsule, when fully inserted into the bore having the head element seal the bore to prevent any leakage of the chemical agent from the bore.

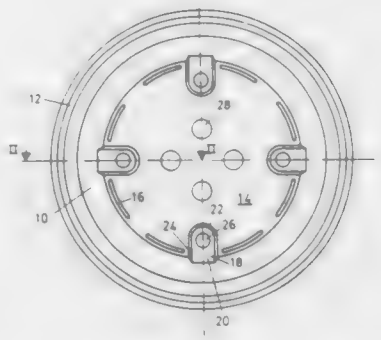
5,010,685
ARTIFICIAL SEED COMPRISING A SUSTAINED-RELEASE SUGAR GRANULE

Yuji Sakamoto, Tochigi; Seiichi Umeda, and Hiroaki Ogishima, both of Saitama, all of Japan, assignors to Kirin Beer Kabushiki Kaisha, Tokyo, Japan
Filed May 1, 1989, Ser. No. 345,897
Claims priority, application Japan, May 2, 1988, 63-109624
Int. Cl.[5] A01C *1/06, 21/00*
U.S. Cl. 47—57.6 **5 Claims**



1. An artificial seed comprising
plant meristematic tissue and
at least one sustained-release granule of sugar comprising a core comprising primarily one or more of a monosaccharide, a disaccharide and a trisaccharide and an outer film comprising 10–90% by weight of an ethylene-vinyl acetate copolymer and 90–10% by weight of a wax, which are encapsulated in a gel matrix.

5,010,686
HYDROPONIC SYSTEM



Daniel J. Rivest, P.O. Box 99, Mill Valley, Calif. 94942
Filed Apr. 20, 1990, Ser. No. 512,154
Int. Cl.[5] A01G *31/00*
U.S. Cl. 47—62 **11 Claims**

1. A hydroponic system, including a channel-like trough having opposed side walls and end walls and a closed bottom defining an upwardly opening coffer, a top cover secured to the trough and dimensioned to close the upwardly opening coffer, a plurality of holes formed in said top cover, a plurality of plant supporting members, each secured in one of said holes and disposed to support a plant with the plant roots extending into said trough and the stem entending upwardly from said top cover, said closed bottom of said trough including a pair of oblique walls joined longitudinally to form a V-shaped bottom extending longitudinally in said trough, a bottom wall extending generally orthogonally between said side walls, said bottom wall, side walls and oblique walls forming a pair of closed chambers extending longitudinally along said trough, each of said oblique walls including an upper edge joined to a respective one of said side walls along a medial line extending longitudinally therealong, each of said oblique walls including a lower edge joined to said bottom wall along a medial line extending longitudinally therealong.

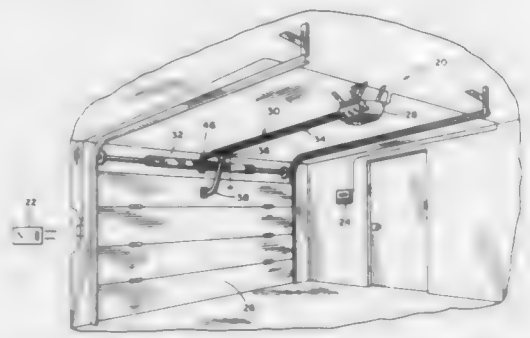
5,010,687
FLOWERPOT

Erling Hougard, Jyllinge, Denmark, assignor to OS Plastic A/S, Farum, Denmark
Continuation of Ser. No. 266,222, Oct. 28, 1988, abandoned, which is a continuation of Ser. No. 829,059, Jan. 21, 1986, abandoned. This application Aug. 10, 1990, Ser. No. 566,808
Int. Cl.[5] A01G *9/02*
U.S. Cl. 47—79 **13 Claims**

1. A flowerpot comprising a sidewall; a substantially plane bottom having at least one opening for the passage of water thereinto; at least one inlet located in said flowerpot sidewall at the lowermost part of the pot for cooperation with a bottom irrigation plant, said inlet providing access to a channel having a top wall portion and first and second sidewall portions, said top portion extending a distance above the bottom of the pot, being arranged essentially parallel to said bottom, and said top portion provided with at least one opening for the passage of air and water, and a plurality of supporting legs arranged on the bottom of the pot extending radially from the sidewall of the pot; wherein at least two of said supporting legs comprises said first and second sidewall portions of said channel.

5,010,688
GARAGE DOOR OPERATOR WITH PLASTIC DRIVE BELT

Kenneth J. Dombrowski, Wheaton, and Joseph Ergun, Itasca, both of Ill., assignors to The Chamberlain Group, Inc., Elmhurst, Ill.
Filed Apr. 30, 1990, Ser. No. 516,662
Int. Cl.[5] E05F *15/16;* **F16H** *19/06*
U.S. Cl. 49—362 **15 Claims**



1. A garage door operator for moving a garage door be-

tween an open position and a closed position, said operator comprising:

a head unit for being fixedly held by a supporting structure positioned remote from said door, said head unit including a motor and a drive wheel having spaced teeth on its periphery for being driven by said motor;

elongate rail means having a first end for being fixedly held by a supporting structure disposed adjacent and above said door, said rail means including a pulley located adjacent said first end, said rail means further including a second end for being fixedly held adjacent to and in alignment with said drive wheel; and

a drive belt assembly for training about said drive wheel and said pulley in two runs and for being supported by said rail means, said belt assembly including a length of a plastic belt with teeth on one surface thereof matching the teeth on said drive wheel, said belt assembly further including a trolley means for connection to said garage door and a first connector for joining one end of said plastic belt to

one end of said trolley means, said plastic belt having a lower surface to which the belt teeth extend, said drive wheel having an upper surface to which the wheel teeth extend, said drive wheel being adapted to engage only said plastic belt component of said belt assembly, said first connector including a belt clip comprising a pair of spaced, aligned side walls, one of said side walls having an inside surface with undulations corresponding to the teeth of said plastic belt, said first connector further including a clip holder deformable from an as-formed position in which said holder can receive said side walls flanking said belt with the belt teeth aligned with said undulations to a deformed position in which said holder firmly holds said side walls with said belt positioned therebetween whereby said belt assembly can be installed by training it around said pulley, moving the plastic belt lower surface over the drive wheel upper surface until their respective teeth are aligned and moving said belt downwardly to train it about said drive wheel.

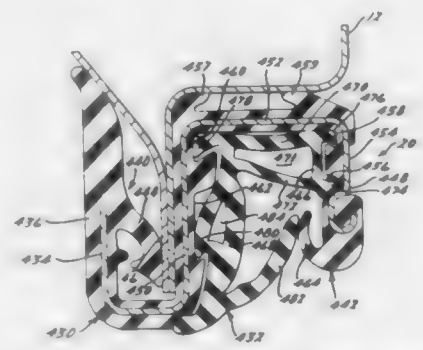
GLASS RUN CHANNEL



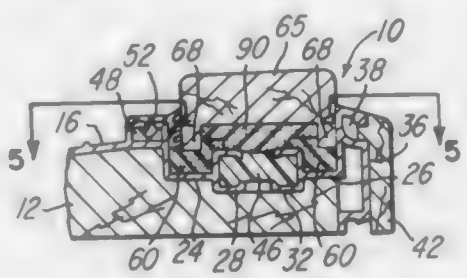
Robert A. Vaughan, Dearborn, Mich., assignor to The Standard Products Company, Cleveland, Ohio

Filed Mar. 19, 1990, Ser. No. 495,783
Int. Cl.[5] E05D *15/16*
U.S. Cl. 49—440 **10 Claims**

1. A glass run channel weather strip comprising:

a first elongated member including a reinforcement element and a skin integrally bonded to said reinforcement member, said first member, in cross-section, having an overall S-shaped with a first and second U-shaped portion, said first U-shaped portion of the S-shape first member having means adapted for retaining the first member onto a flange, the second U-shaped portion having one or more retaining channels formed in the integral skin on the interior of the U-shaped portion; and

a second elongated member having an overall U-shape in cross-section, one or more projecting members projecting from the exterior of the U-shape having shapes complementary to the shapes of the one or more channels in the second U-shaped portion of the S-shaped member adapted for coupling with said one or more channels for mechanically retaining said second member within said first member, and a finger member projecting from one of the legs of the U-shaped second member into the interior of the U-shaped second member to provide a seal when a window is positioned in the glass run channel.

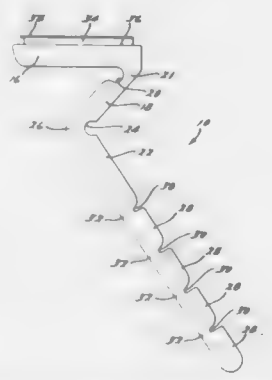


5,010,690

ADJUSTABLE THRESHOLD ASSEMBLY WITH WATER-TIGHT SEALS

David C. Geoffrey, Richmond, Ind., assignor to Imperial Products, Inc., Richmond, Ind.

Filed Apr. 14, 1990, Ser. No. 509,704
Int. Cl.[5] E06B *1/70*
U.S. Cl. 49—468 **10 Claims**



1. An improved threshold assembly adapted to be installed below the bottom surface of a movable door, comprising an elongated horizontal sill member including a sloping top wall connected to walls defining a longitudinally extending and upwardly facing cavity, a first resilient closed cell foam material within said cavity, an elongated rail member disposed within said cavity and having opposite end portions and a bottom surface, said rail member including longitudinally extending means projecting downwardly into said first foam material within said cavity to form a fluid-tight dependable seal between said rail member and said sill member, means for adjusting said rail member vertically within said cavity, a pad of second resilient closed cell foam material engaging said bottom surface of each said end portion of said rail member, each said pad of second foam material overlapping and engaging said first foam material within said cavity to form fluid-tight seals at said opposite end portions of said rail member, and said first and second foam material being compressible and expandable in response to vertical adjustment of said rail member for maintaining said fluid-tight seal with different vertical positions of said rail member.

5,010,691

WEATHER SEAL FOR A DOOR

Kenjiro Takahashi, Dearborn Heights, Mich., assignor to The Standard Products Company, Cleveland, Ohio

Filed Aug. 8, 1989, Ser. No. 390,776
Int. Cl.[5] E06B *7/16*
U.S. Cl. 49—482 **7 Claims**

1. A weather seal for a door having a gap between the door and a support surface comprising:

a base member adapted to be secured to a surface of the door, said base member extending longitudinally in a plane along the surface of the door;

a hinge member pivotally connected to said base member for pivotal movement relative to said base member and extending outwardly in a first direction at an angle to the plane of said base member;

a sealing lip pivotally connected to said hinge member for pivotal movement relative to said hinge member and extending outwardly in a second direction further removed from said base member and at an angle opposite to an angle between said hinge member and said base member and having a first position at an angle to the plane of said base member and a second position to engage a support surface to effect a seal between the door and the support surface;

said sealing lip including means for varying the width of said sealing lip to a predetermined width to effect a seal between the door and the support surface.

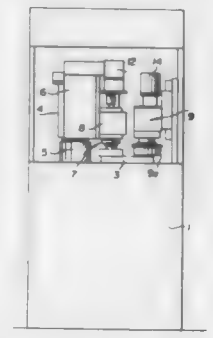
5,010,692

POLISHING DEVICE

Takao Ishida, Aichi; Hiroshi Hagiwara, and Ichizo Kakumu, both of Nagoya, all of Japan, assignors to Sintobrator, Ltd., Aichi, Japan

Continuation of Ser. No. 307,037, Feb. 7, 1989, abandoned, which is a division of Ser. No. 177,268, Apr. 4, 1988, abandoned. This application Feb. 6, 1990, Ser. No. 474,690
Int. Cl.[5] B24B *1/00*
U.S. Cl. 51—283 R **2 Claims**

1. A method of polishing a workpiece comprising the steps of:



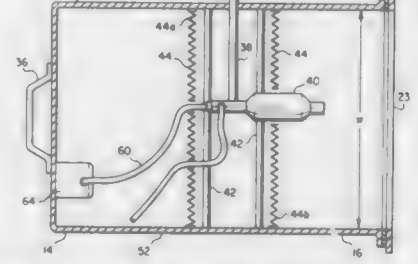
positioning said workpiece in a holding device comprising a movable arm;

delivering said workpiece from a supply position to a grinding position by movement of said movable arm;

pressing a surface of the workpiece to a grinding surface of a rotary grindstone while rotating the grindstone;

rotating said workpiece about a central axis of the workpiece while pressing said surface of the workpiece against said grinding surface;

feeding a rotating truing dressing grinding downwardly against said rotary grindstone grinding surface at a position spaced apart from said workpiece; and simultaneously with said pressing and rotating of said workpiece, continuously truing dressing said grinding surface



by said truing dressing grindstone at said position spaced apart from said workpiece.

5,010,693

SELF-CONTAINED SANDBLASTING UNIT

Tobie D. Hatch, 201 Shady Shores, No. 94, Lake Dallas, Tex. 75065

Filed Sep. 15, 1989, Ser. No. 408,196
Int. Cl.[5] B24C *9/00, 3/06, 5/04*
U.S. Cl. 51—427 **11 Claims**

1. A self-contained sandblasting unit comprising:

a housing, said housing having a principal body portion and an outlet body portion, said outlet body portion having a proximal end and a distal end, said outlet body portion defining an opening therethrough at said distal end thereof whereby the interior of said housing is in communication with the external environment of said housing through said opening, said proximal end of said outlet body portion being connected to said principal body portion;

a slidable support bar mounted through said principal body portion whereby said support bar is laterally slidable through said principal body portion;

a means for isolating said slidable support bar from the interior environment of said housing;

a nozzle, said nozzle mounted on said slidable support bar whereby said nozzle is directed through said opening defined through said distal end of said outlet body portion, and whereby said nozzle is laterally slidable through said principal body portion;

a compressed air source attached to said nozzle; and

a particulate matter source connected to said nozzle whereby a stream of compressed air and particulate matter is directed through said nozzle and through said opening defined through said distal end of said outlet body portion at a constant angle as said nozzle is moved laterally through said principal body portion.

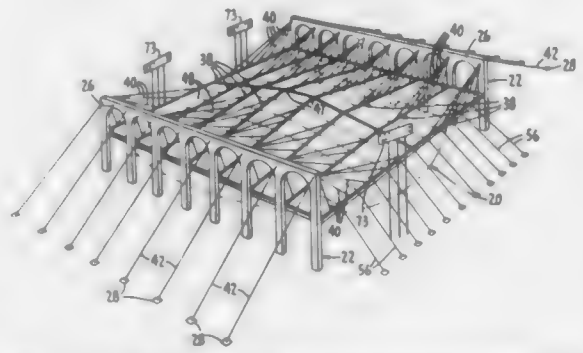
5,010,694

FLUID CUTTING MACHINE

Robert O. Agbede, Monroeville, Pa., assignor to Advanced Technology Systems, Inc., Monroeville, Pa.

Filed Aug. 1, 1989, Ser. No. 388,151
Int. Cl.[5] B24C *3/06*
U.S. Cl. 51—429 **19 Claims**

1. Apparatus for severing metal casing comprising,
a supply of abrasive particles,
a vessel for storage of the abrasive particles,
said vessel having an inlet at the bottom of said vessel for receiving air under pressure to pressurize said vessel to a preselected level to suspend the abrasive particles in said vessel, said vessel inlet serving as an outlet for discharging from the bottom of said vessel the abrasive particles entrained in a pressurized air stream,
a source of water under pressure,
a nozzle assembly positioned adjacent the metal casing to be severed,
said nozzle assembly having a first inlet for receiving the abrasive particles entrained in said pressurized air stream, a second inlet for receiving a flow of the pressurized water, a mixing chamber, an outlet nozzle for discharging the abrasive particles encapsulated in the flow of pressurized water to form an abrasive cutting stream,
manipulator means for mounting said nozzle assembly for rotation at a controlled rate around the casing as said abrasive cutting stream impacts the surface of the casing,
means for charging said vessel with compressed air through said vessel inlet to maintain the abrasive particles suspended under pressure within said vessel wherein the abrasive particles have a size capable of maintaining substantially all the particles in said vessel in suspension by the air under pressure, and
conduit means for controlling the flow of the abrasive particles entrained in said pressurized air stream from said vessel inlet through said nozzle assembly inlet to said mixing chamber for mixture with the pressurized water and discharge from said outlet nozzle as said abrasive cutting stream upon the metal casing.



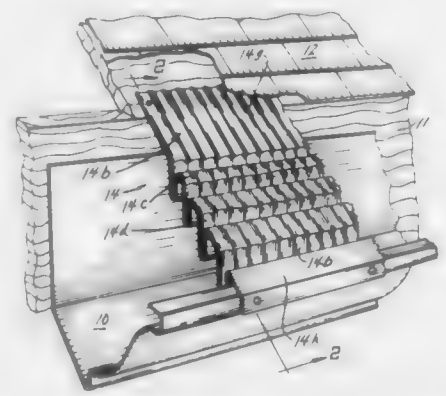
5,010,695

CABLE-STAY ROOF FOR STADIUM OR ARENA AND METHOD OF CONSTRUCTION OF SAME

Adam T. Schildge, Jr., 899 Green St., San Francisco, Calif. 94133

Filed Jan. 10, 1990, Ser. No. 462,831
Int. Cl.[5] E04H *3/10*; E04B *7/14*
U.S. Cl. 52—6 **8 Claims**

5. A roof structure for use over an open topped stadium, said structure comprising:
(a) a first row of cable stay towers located outside one side of the stadium;
(b) a second row of cable stay towers located outside the stadium to the side thereof opposite said one side;
(c) a first roof section cantilevered from the first row of towers and extending therefrom partially over the stadium and toward the second row of towers, said first roof section being disposed in compression imparting relationship to the first row of towers;
(d) a second roof section cantilevered from the second row of towers and extending therefrom partially over the stadium and toward the first row of towers, said second roof section being disposed in compression imparting relationship to the second row of towers and said first and second roof sections having spaced distal edges defining a open span gap therebetween;
(e) first cable stay means extending from each row of said towers to suspend the load of the roof section cantilevered therefrom,



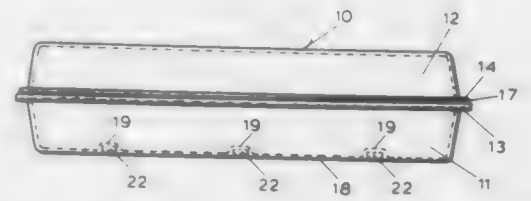
(f) second cable stay means extending from each row of said towers to counterbalance the load imparted to the towers by the first cable stay means;
(g) an intermediate roof section disposed between the first and second roof sections to at least partially close the gap therebetween; and,
(h) cable stays suspending the intermediate roof section in tension between the first and second rows of towers to support the intermediate section without imparting substantial loading to the first and second roof sections.

5,010,696

ROOF GUTTER ATTACHMENT

Richard D. Knittel, R. 4, Pinckard Pike, Versailles, Ky. 40383

Filed Aug. 13, 1990, Ser. No. 565,932
Int. Cl.[5] E04D *13/00*
U.S. Cl. 52—12 **13 Claims**



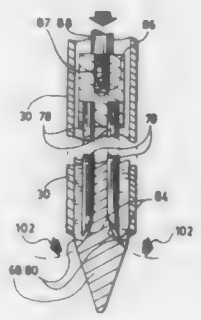
1. An attachment for a gutter positioned in the eave region of a building comprising a body overlying said gutter at an operative position, said body presenting a series of generally parallel horizontal steps angling in a downward direction in a pattern encouraging liquid flow to an outlet in said gutter, said steps each separated by a receiving pocket, and where said receiving pocket includes outlet means for liquid discharge into said gutter.

5,010,697

MAUSOLEUM CONSTRUCTION

Jerry C. Schwarten, 5131 N. Cumberland Blvd., Milwaukee, Wis. 53217

Continuation of Ser. No. 700,412, Feb. 11, 1985, Pat. No. 4,669,157. This application May 15, 1987, Ser. No. 50,731
The portion of the term of this patent subsequent to Jun. 2, 2004, has been disclaimed.
Int. Cl.[5] A61G *17/00*
U.S. Cl. 52—134 **2 Claims**



1. A mausoleum, comprising a plurality of caskets, each of said caskets including a lower, trough-shaped, upwardly opening bottom portion having an upper peripheral lateral flange, an upper, trough-shaped, downwardly opening bottom portion cover having a lower perpheral lateral flange superposed on said upper flange of said bottom portion, and means for sealing said flanges together in an airtight fashion; a support structure made of structural members and having means for supporting each of said caskets; and a housing enclosing said caskets and said support structure, wherein said means for supporting said caskets comprises a plurality of pairs op parallel, spaced apart rails, each of said caskets being insertable between a pair of said rails so that said flanges of each casket are superposed on said pair of rails on opposite lateral sides of said casket to support said casket.

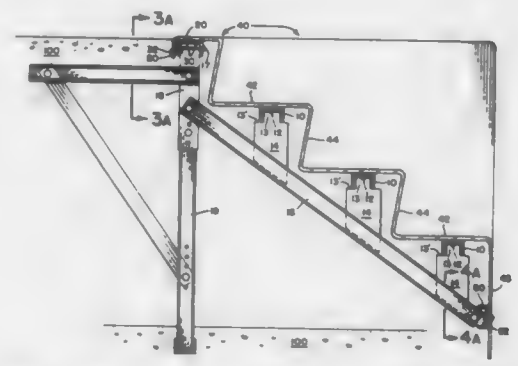
ANCHORING POST ASSEMBLY

Denis P. Hugron, 1855, Georges, St-Hubert, Quebec, Canada

Filed Jul. 17, 1990, Ser. No. 553,526
Int. Cl.[5] E02D *5/80*
U.S. Cl. 52—160 **4 Claims**



1. An anchoring post adapted to be driven into the ground, said post comprising:
a hollow uniform cylindrical member;
a pointed tip rigidly secured to the lower end of said cylindrical member, said tip having an upper tubular portion fittingly inserted into said cylindrical member and a conical lower portion extending below said cylindrical member, said tubular portion having a pair of vertical recessed channels grooved on its periphery and diametrically disposed relative to each other, said channels extending downwardly and partly into the conical portion to provide a pair of diametrically disposed openings below the cylindrical member, said channels having a slanted lower face directed outwardly in opposite directions, a tubular neck portion slidingly fitting into said cylidrical member above said pointed tip, a pair of elongated prongs rigidly secured to said tubular neck portion at the lower end thereof, said prongs being diametrically disposed relative to said tubular neck portion, and each prong adapted to fittingly slide into a corresponding channel of said channels, said neck portion being provided with a threaded bore adapted to threadedly receive a threaded bar for downwardly pushing said prongs through said openings until said neck portion abuts against said pointed tip, said prongs adapted to laterally extend outwardly relative to said cylindrical member, a sleeve inwardly secured at the upper end of said cylindrical member, said sleeve having an internally threaded hole, a flat ring secured at the upper end of said cylindrical member and of said sleeve for providing a wide striking surface for driving said cylindrical member into the ground and a tieing nut threadedly mounted in said sleeve for tightly closing said threaded hole,
whereby said cylindrical member is driven into the ground by pressure applied on said flat ring, and said prongs are driven through said openings into the ground laterally in opposite directions relative to the cylindrical member by said bar pushing on said neck portion through said sleeve, said threaded hole being subsequently closed by said tieing nut.

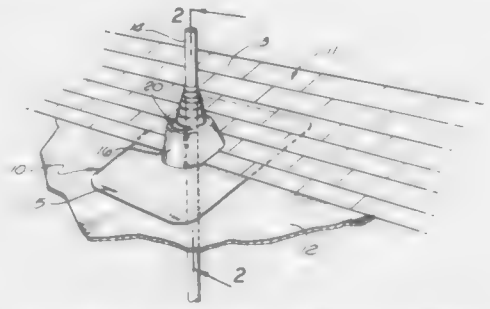
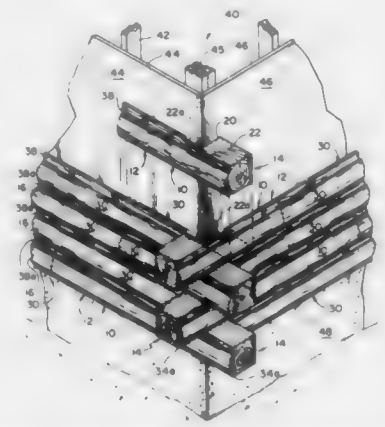
MODULAR STAIR SUPPORT FIXTURES HAVING ALTERNATE PACKAGING USAGE



John V. Maiuccoro, Albany, and John Gardenier, Guilderland, both of N.Y., assignors to Saratoga Spa & Bath, Latham, N.Y.

Filed May 9, 1990, Ser. No. 521,328
Int. Cl.[5] E02D *27/00*
U.S. Cl. 52—169.8 **5 Claims**

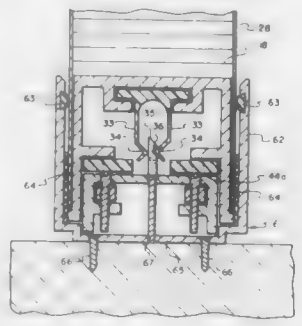
1. In a stair support system comprising a preformed stair module and including a folding outer leg having top and bottom ends with bottom end securing means and top end fastening means for connection to a stair module top end fixing means, a stringer having a top end removably connected to the outer leg, adapted to underlie steps of said module and removably connectable by bottom end fastening means to a buttress riser of said module, and a plurality of stair support members each of which has a first support end connected to the stringer and a second support end adapted to underlie and support a normally horizontal step structural element, an improvement comprising:
a first rigid brace means disposed in a collar means of said module, said first brace means further comprising mortise means therewithin and adapted to receive an outer leg therein and directly contact an end of said outer leg;
a second rigid brace means disposed on the module at the backside of said buttress riser of said module and comprising a front buttress, said front buttress adapted for fastening thereto said stringer; and
said plurality of support members each defining at each said second support end thereof a plane tenon.



5,010,700
ROOF JACK
Earl Blair, 19340 E. San Jose Ave., City of Industry, Calif. 91748
Continuation of Ser. No. 374,286, Jun. 30, 1989, abandoned. This application Jul. 23, 1990, Ser. No. 581,422
Int. Cl.[5] E04H *12/28*
U.S. Cl. 52—199 **15 Claims**

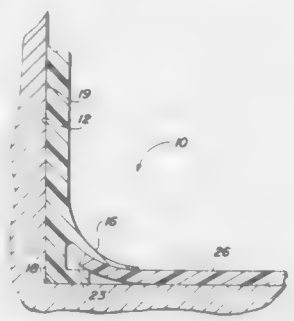
1. A roof jack or vent seal for use on a generally planar pitched roof having a vent or structure extending upward through the roof and requiring a weather seal comprising:
- a flexible vacuum formed unitary plastic member of polymeric-synthetic rubber material including a generally planar portion;
- said generally planar portion surrounding an upstanding portion;
- said upstanding portion including a plurality of coaxial substantially parallel stepped reduced diameter tubular portions, each including an upstanding portion of substantial length having an internal dimension generally coorresponding to the outside dimensions of a structure to be used with said roof jack; and
- said flexible plastic member including a transition portion between said base portion and at least one of said tubular portions;
- said transition portion including at least one corrugation which will flex to allow the generally planar portion to conform to the plane of the roof to which the roof jack is secured permitting the tubular portion to extend generally parallel to the length of a structure extending therethrough;
- said flexible plastic member being severable at the tubular portion corresponding to the outside dimension of the vent.

5,010,701
CORNER SYSTEM FOR LOG CABIN SIDING
Brenton S. Halsey, Jr., Richmond, Va., and Arthur C. Larson, Brewer, Me., assignors to Diamond Occidental Forest, Inc., Old Town, Me.
Filed Dec. 5, 1989, Ser. No. 446,328
Int. Cl.[5] E04B *1/10*
U.S. Cl. 52—233 **8 Claims**



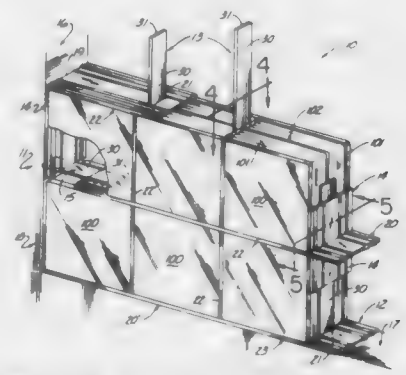
1. A corner system for building construction with log cabin siding comprising:
- a building corner with first and second walls covered with sheathing material intersecting substantially at right angles;
- elongate wall siding pieces applied over the walls, said wall siding pieces having a flat inner side facing the building wall and a curved outer side for simulated log cabin appearance, said wall siding pieces being applied in substantial horizontal alignment over the walls and arranged with top and bottom edges of adjacent wall siding pieces abutting;
- elongate corner siding pieces for use on the walls at the building corner, said corner siding pieces having an elongate wall covering portion matching the wall siding pieces and being arranged in horizontal alignment with the wall siding pieces, and an elongate projecting log end portion extending beyond the building corner, said projecting log end portion being formed integrally in a single piece with the wall covering portion, each corner siding piece being cut from a single piece of wood without a joint or seam and with continuous grain between the wall covering portion and projecting log end portion;
- said projecting log end portion having a thickness substantially greater than the wall covering portion for simulated whole log appearance at the building corner;
- said corner siding pieces on the intersecting walls at the building corner being arranged in vertical sequence at the building corner with projecting log end portions extending alternately from the first and second walls substantially at right angles to each other, each corner siding piece having a wall covering portion applied to one of the first or second walls and a projecting log end portion with a flat reverse facing side abutting against the other wall;
- said corner siding pieces being formed with a flat inset surface on top formed over the length of the projecting log

end portion and along a length of the wall covering portion a distance substantially equal to the lateral thickness of the projecting log end portion for accommodating the projecting log end portion of the next corner siding piece extending at right angles in vertical sequence above;
- each corner siding piece on one wall having the projecting log end portion abutting the end of a wall siding piece applied in horizontal alignment and at right angles on the other wall;
- the corner siding pieces being formed with projecting log end portions having flat top and bottom faces along the length of the projecting log end portions, said projecting log end portions resting on each other in vertical sequence;
- the projecting log end portion of each corner siding piece on one wall being formed with a flat inner face, the abutting wall siding piece in horizontal alignment at right angles on the other wall being formed with a straight edge at the end for abutting against the flat inner face of the projecting log end portion.



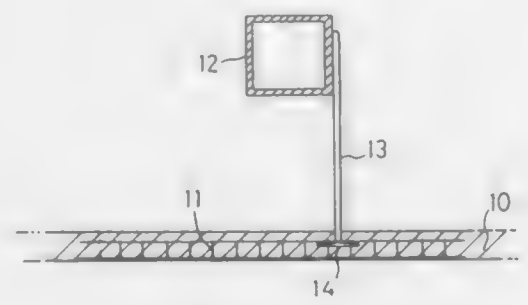
5,010,702
MODULAR WALL SYSTEM
Terry L. Daw, and David F. Procter, both of Salt Lake City, Utah, assignors to Daw Technologies, Inc., Salt Lake City, Utah
Continuation-in-part of Ser. No. 331,826, Apr. 3, 1989. This application May 30, 1989, Ser. No. 358,876
Int. Cl.[5] E04B *2/88;* **E04H** *5/00*
U.S. Cl. 52—241 **5 Claims**

1. A modular wall system for removable placement between a floor and a ceiling comprising:
- panel means having a top portion and a bottom portion, said bottom portion including a first fastening member and a generally U-shaped channel member having two leg members separated by a central member, said central member comprising a bottom surface along substantially the entire length thereof, said bottom surface having means for attaching said first fastening member thereto,
- head means attachable to the ceiling for contacting said top portion of said panel means,
- elongate floor means comprising a second fastening member and a generally U-shaped channel portion having two leg portions separated by a central portion, said floor means being placeable on the floor for contacting said bottom portion of said panel means, said central portion comprising a support surface which extends along substantially the entire length thereof, said second fastening member being located on said support surface,



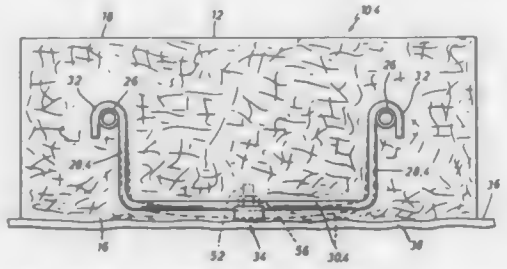
whereby, when said panel means is positioned on said elongate floor means, said first fastening member can attach to said second fastening member while said bottom surface and said support surface remain in spaced-apart relationship,
- said modular wall system further including means attachable to the floor for cradling said floor means, said cradling means comprising a U-shaped member having a central portion and leg portions, said central portion having means for attachment to the floor and to said floor means, each of said leg portions having means for aligning said bottom portion of said panel means and gasket means for inhibiting the flow of airborne particulates around said bottom portion of said panel means, whereby said floor means is prevented from contacting the floor by said cradling means.

5,010,703
WALLBASE MOLDING STRIP
Mort Pearlman, 7360 SW 16th Street, Plantation, Fla. 33317, and Neal V. Valkenburg, P.O. Box 224, Astatula, Fla. 32705
Continuation of Ser. No. 237,576, Aug. 26, 1988, abandoned. This application Sep. 18, 1989, Ser. No. 409,956
Int. Cl.[5] E04F *19/04*
U.S. Cl. 52—288 **9 Claims**



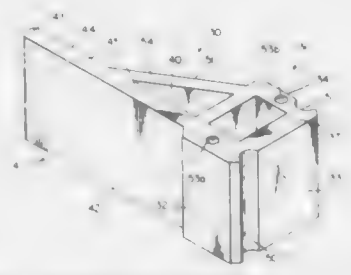
1. In combination with a wall, a floor joining said wall and a flooring material of certain thickness covering said floor, an elongated wallbase molding strip of resilient material comprising:
- a vertical back portion having front and rear surfaces bounded by top and bottom edges;
- a skirt portion extending outwardly and downwardly in a smooth and continuous contour from said front surface of said back portion along a first line intermediate said top and bottom edges to a skirt portion leading edge; and
- self-hinge means in the form of a recess running longitudinally along said rear surface of said strip along a second line, said recess being dimensioned, configured and adapted for facilitating the folding of a bottom part of said back portion away from a top part of said back portion along a second line intermediate said top and bottom edges, said second line being below said first line;
- said bottom part being folded forwardly at said recess, said rear surface being positioned against said wall at said top part and against said floor at said bottom part; and said skirt portion pressing down at said leading edge onto said flooring material, with said contour serving as a smooth and continuous transition from said front surface above said first line to said flooring material.

5,010,704
GLASS BLOCK CONSTRUCTION ASSEMBLY
Earl G. Thompson, 16121 SE. Fourth St., Vancouver, Wash. 98684
Filed May 21, 1990, Ser. No. 525,569
Int. Cl.[5] E04G *21/18*
U.S. Cl. 52—308 **3 Claims**



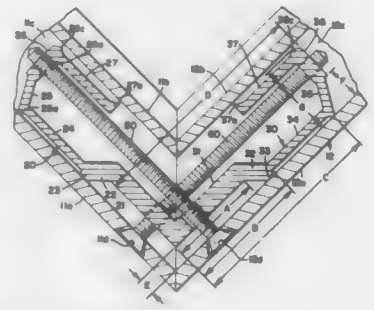
1. A glass block construction assembly for glass blocks having raised beads surrounding the external faces of the block and an intermediate raised bead surrounding the interior periphery of the block wherein the assembly comprises:
- an outer assembly unit including vertical and horizontal wall segments which form an open framework member;
- a horizontal alignment unit comprising a plurality of elongated contoured slat members provided with a plurality of spaced apertures; and opposed sides which are contoured and colored to resemble a concave tooled joint; wherein, the contoured members are further provided with a pair of upper and lower raised longitudinal ribs which are disposed on opposite sides of the said plurality of apertures;
- a vertical alignment unit comprising: a plurality of elongated relatively thin and flat slat members provided with at least one elongated longitudinal slot wherein the flat slat members are dimensioned to be received in selected ones of said plurality of spaced apertures in the plurality of contoured slat members for forming an open matrix within the said assembly unit wherein the glass blocks are dimensioned to be received within the openings in the matrix; and, a plurality of vertical spacing units comprising truncated segments of said flat slat members wherein, said truncated segments of said flat members are dimensioned to be received between the raised longitudinal ribs on one side of the contoured slat members; and wherein, the longitudinal recess in the flat slat members is dimensioned to receive the said intermediate raised bead on the glass blocks.

5,010,705
CURTAIN WALL
Shigeyuki Akihama, Kanagawa; Mikio Kobayashi, Tokyo; Tatsuo Suenaga, Tokyo; Toshiyuki Fukumoto, Tokyo; Yoshikazu Taniguchi, Tokyo, and Hiroaki Nakagawa, Tokyo, all of Japan, assignors to Kajima Corporation, Tokyo, Japan
Division of Ser. No. 339,788, Jan. 4, 1989. This application May 1, 1990, Ser. No. 517,224
Int. Cl.[5] E04C *2/26, 2/46;* E04B *2/88*
U.S. Cl. 52—477 10 Claims



1. A curtain wall building panel, comprising:
a plurality of first sets of first fibers, each of said first fibers extending substantially parallel to a first direction, each of said first sets containing a plurality of said first fibers disposed in a respective plane and spaced from each other by respective first distances, each of said respective planes of said first sets being disposed substantially parallel to each other and being spaced from each other by respective second distances;
a plurality of second sets of second fibers, each of said second fibers extending substantially parallel to a second direction perpendicular to said first direction, each of said second sets containing a plurality of said second fibers disposed in a respective plane and spaced from each other by respective third distances, each of said respective planes of said second sets being disposed substantially parallel to each other and to said respective planes of said first sets and being spaced from each other by said respective second distances, said first fibers of each of said first sets being connected to said second fibers in an associated one of said second sets at intersection points;
a plurality of third fibers extending substantially parallel to a third direction substantially perpendicular to both said first and said second directions, each of said third fibers being connected to an associated one of said intersection points in each of said first and second sets, said first, said second and said third fibers being formed from one or more of the group consisting of carbon, aramid, glass, formalized polyvinylalcohol or polyethelene, whereby said first, second and third fibers comprise edges of at least one cell and define a self-supporting three dimensional braid;
a frame spaced from said braid and extending in a plane substantially parallel to said respective planes of said first and second sets;
at least one flexible anchor extending between said frame and said braid, a first end of said anchor being connected to said frame and a second end of said anchor being connected to said braid; and
an essentially rigid building material encompassing, and at least essentially filling said at least on cell of, said braid and encompassing a portion of said at least one anchor.

5,010,706
INSULATION AND THE PROVISION THEREOF
Robert A. Sauder, Emporia, Kans., assignor to Thermal Ceramics, Inc., Augusta, Ga.
Continuation of Ser. No. 920,282, Oct. 17, 1986, Pat. No. 4,984,405, which is a continuation of Ser. No. 830,462, Feb. 18, 1986, abandoned, which is a continuation of Ser. No. 752,078, Jul. 3, 1985, abandoned, which is a continuation of Ser. No. 331,673, Dec. 17, 1981, abandoned. This application May 10, 1990, Ser. No. 521,749
The portion of the term of this patent subsequent to Jan. 15, 2008, has been disclaimed.
Int. Cl.[5] E04B *1/80*
U.S. Cl. 52—506 32 Claims



1. An insulation member for insulating a furnace surface, comprising:
a deformable mat of fibrous insulation material having a cold face, to be positioned against a furnace surface, the mat having an opposed hot face, the fibrous insulation material having fiber planes which extend generally normally with respect to the cold face;
elongated connection means having a mounting for receiving a stud to be attached to the furnace surface, and having channels remote from said mounting, the connection means being positioned in the mat so that contact between the cold face and the furnace surface consists substantially entirely of said fibrous insulation material, thereby presenting a deformable cold face that can conform to the contour of the furnace surface; and,
elongated linear members extending generally parallel to the cold face and transversely with respect to the fiber planes, the elongated linear members being positioned within the mat spaced from both the cold face and the hot face, the elongated linear members being disposed in said channels of the connection means.

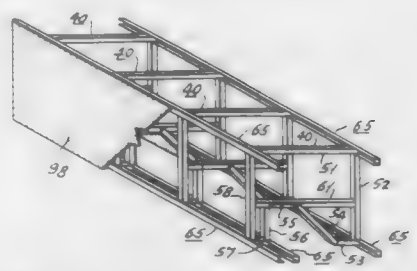
RETAINING WALL BLOCK MODULE
Ned Nelson, 3 Lake Bellevue Dr., Suite 200, and William H. Duesenberg, 3 Lake Bellevue Dr., Suite 100, both of Bellevue, Wash. 98005
Filed Aug. 21, 1989, Ser. No. 396,088
Int. Cl.[5] E04B *5/04*
U.S. Cl. 52—605 8 Claims



1. A retaining wall block comprising:
(a) A body having a front surface, a vertical central passageway, and one or more identically shaped vertical recesses;
(b) A leg extending laterally from said body and having a vertical end surface with a shape complementary to that of said recesses, wherein said leg joins said body forwardly of a center of said central passageway, and
(c) a diagonal support disposed between said body and said leg.

5,010,708
CORNER LOCK
Harold H. Evans, Hudson, Wis., and Todd W. Bruchu, Lake Elmo, Minn., assignors to Anderson Corporation, Bayport, Minn.
Filed Mar. 10, 1989, Ser. No. 321,730
Int. Cl.[5] F16B *7/00*
U.S. Cl. 52—656 11 Claims

9. A frame corner comprising:
(a) a first frame member having a mitred end and forming an opening and channel and first channel cavity at its mitred end;
(b) a second frame member having a mitred end and forming an opening and second channel cavity member at its mitred end;
(c) both of said cavities having first surfaces and second, opposite surfaces; and
(d) a corner fastener for cooperatively connecting said first frame member to said second frame member, said fastener comprising:
(i) a first leg member having a first and second end, and a second leg member, having a first and second end, said first ends cooperatively connected to each other at an intersection;
(ii) said leg members in relation to the intersection each having proximal and distal sections;
(iii) said proximal sections each having an aperture formed therein through which the fastening members may pass;
(iv) said first leg member having an auxiliary section cooperatively connected to said distal section, said auxiliary section of said first leg having an a threaded aperture for receiving the first fastening member;
(v) said second leg member having an auxiliary section cooperatively connected to said distal section, said auxiliary section of said second leg having a threaded aperture for receiving the second fastening member; and
(vi) said distal sections being offset relative to said proximal sections respectively, whereby when said fastener is inserted in the channel cavities, said distal section of the first leg member contacts the first surface of the first channel cavity and the distal section of the second leg section contacts the first surface of the second channel cavity, wherein said distal sections act as a fulcrum against the first surfaces when the fastening members are tightened through said threaded apertures and brought closer to the frame members by rotation of said fastening members in said threaded apertures, thereby permitting alignment and adjustment of the mitres of the first and second frame members.

BENDABLE CHANNEL CONSTRUCTION ELEMENT
Felix Paz, 256 Greenway Rd., Lido Beach, N.Y. 11561
Filed Feb. 28, 1990, Ser. No. 486,078
Int. Cl.[5] E04C *2/38;* E04B *1/00*
U.S. Cl. 52—658 13 Claims

1. A construction element comprising:
an elongated channel having a generally U-shaped cross-section that includes a web, parallel firs and second arms each having a front end and rear end, said arms at their front ends being connected to said web and extending rearward from opposite ends of said web;
said channel being bendable to define integrally formed first and second sections that are disposed at a selected angle with respect to each other and connected in end to end relation at a transverse bend line in said web;
said channel prior to bending thereof at said bend line having said first and second sections in axial alignment;
prior to bending of said channel at said bend line, said first and second arms each having a notch therein extending between said front and rear ends and including a V-section having its apex disposed at as front end;
said bend line extending between the apiece of said V-sections prior to bending of said channel at said bend line, each of said arms having first and second aperture means disposed on opposite sides of said notch;
with said channel sections being disposed at said selected angle said first aperture means being aligned with said second aperture means;
said first and second aperture means of said first arm, when aligned, being adapted to receive a fastening means to maintain said channel sections disposed at said selected angle;
said first and second aperture means of said second arm, when aligned, being adapted to receive fastening means to maintain said channel sections disposed at said selected angle;
said front end and said rear end being spaced by a distance that is comparable to the length of said transverse bend line; and
each of said V-sections extending toward said rear end for a distance that is substantially less than the distance between said front end and said rear end.

FOUNDATION LEVELING AND EQUALIZATION SYSTEM

Gilford P. Batio, and Jeffrey A. Batio, both of 534 N. Grace St., Mundelein, Ill. 60060

Continuation of Ser. No. 187,385, Apr. 28, 1988, abandoned. This application Jan. 10, 1990, Ser. No. 463,903

Int. Cl.[5] E04B *1/00*

U.S. Cl. 52—742 **9 Claims**

1 A method of applying a layer of filler material to an existing concrete foundation to provide a substantially level foundation surface, comprising the steps of:

selecting a settable filler material having a slow enough setting time and a low enough viscosity to flow and assume a level condition over a substantial portion of a wall without the need of screeding,

generally determining the amount of deviation of the top surface of a foundation wall from a level surface,

determining the amount of said filler material sufficient to exceed the volume formed by said deviation along said foundation wall,

positioning a means to retain said filler material along said top surface of said foundation wall,

securing said filler material retaining means to said foundation such that it provides for a sufficient vertical interval above said foundation for said filler material to seek its own horizontal level within said retaining means,

pouring said determined amount of filler material into said filler retaining means,

allowing said filler material to seek its own level within said retaining means, and

allowing said filler material to harden.

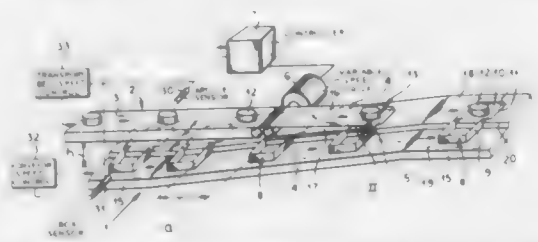
METHOD OF AND APPARATUS FOR THE PACKAGING OF PRESSURE-SENSITIVE ARTICLES



Heinz F. Odenthal, Zülpich, Fed. Rep. of Germany, assignor to Ostma Maschinenbau GmbH, Zulpich, Fed. Rep. of Germany

Filed Aug. 8, 1990, Ser. No. 565,019

Claims priority, application Fed. Rep. of Germany, Aug. 9, 1989, 3926261

Int. Cl.[5] B65B *5/04, 23/00*

U.S. Cl. 53—55 **6 Claims**

1 A method of packing pressure-sensitive articles, comprising the steps of:

(a) advancing prefolded boxes each formed with a packing underlay in mutually spaced relationship continuously in succession in a transport direction along a transport path so that each of said packing underlays extends away from a respective cover and is formed with sidewall flaps;

(b) simultaneously advancing on a continuously driven transport belt above said boxes, a succession of said articles in mutually spaced relationship in said direction;

(c) transferring said articles one at a time from said transport belt to a delivery belt converging toward said path so that only one of said articles at a time is present on said delivery belt;

(d) continuously feeding each of said articles on said delivery belt to a transfer location substantially meeting a respective one of said packing underlays to transfer the article to the respective underlay;

(e) controlling a speed of said delivery belt for each article thereon so that each article meets the respective underlay at said location; and

(f) erecting the respective flaps of each underlay to which a respective article has been transferred and folding the respective cover thereover to enclose the article in the respective box

APPARATUS FOR PACKAGING FISHES IN CANS

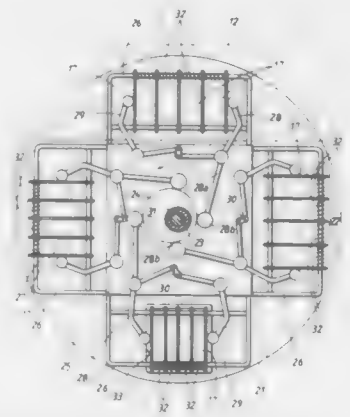
Leif Leander, Askim, Sweden, assignor to VMK Fish Machinery AB, Goteborg, Sweden

Filed Jul. 18, 1989, Ser. No. 381,184

Claims priority, application Sweden, Jul. 20, 1988, 8802684-4

Int. Cl.[5] B65B *5/08, 35/56*

U.S. Cl. 53—142 **8 Claims**



1. An apparatus for packaging fish in cans comprising:

conveyor means for conveying fish at a substantially continuous speed wherein each fish is positioned on the conveyor means with a predetermined longitudinal and transverse orientation;

a vertical shaft cooperating with said conveyor means; and

at least two matrix means for delivering said fish from said conveyor means to said cans, each of said matrix means connected to said vertical shaft and comprising a plurality of adjacent compartments wherein any two adjacent compartments are separated by a side wall, and wherein each of said matrix means are spaced at an equal angular distance around said vertical shaft;

said conveyor means cooperating with said vertical shaft such that said conveyor means conveys fish at a substantially continuous speed to one of said matrix means, whereby said vertical shaft rotates said matrix means in increments, said vertical shaft rotating one increment after

a predetermined number of fish are delivered by the conveyor means to one of said matrix means.

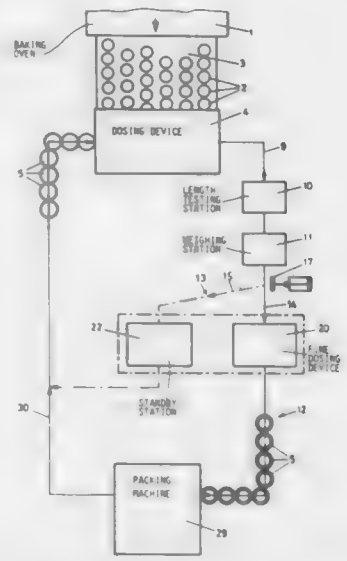
METHOD AND APPARATUS FOR CONVEYING ARTICLES, PARTICULARLY WAFER-SHAPED FOOD PRODUCTS



René Fluck, Schleitheim, Switzerland, assignor to SIG Schweizerische-Industrie-Gesellschaft, Neuhausen am Rheinfall, Switzerland

Filed Feb. 23, 1989, Ser. No. 313,868

Claims priority, application Switzerland, Feb. 25, 1988, 708/88

Int. Cl.[5] B65B *5/10, 65/08*

U.S. Cl. 53—447 **7 Claims**

1. A method of supplying stacks of flat articles to a packing machine; each article stack being of predetermined weight and length; comprising the following steps:

(a) charging receptacles in a dosing device with articles to obtain in each receptacle an article stack shorter and lighter than said predetermined weight and length;

(b) advancing some of the charged receptacles to a standby station and some of the charged receptacles to a fine dosing device;

(c) charging the receptacles in the fine dosing device with articles until the predetermined weight and length are substantially reached; said charging step in said fine dosing device including the step of transferring articles from a receptacle dwelling in said standby station to a receptacle dwelling in the fine dosing device;

(d) subsequent to step (c), advancing the receptacles from the fine dosing device to the packing machine; and

(e) advancing empty receptacles from the packing machine and the standby station to the dosing device.

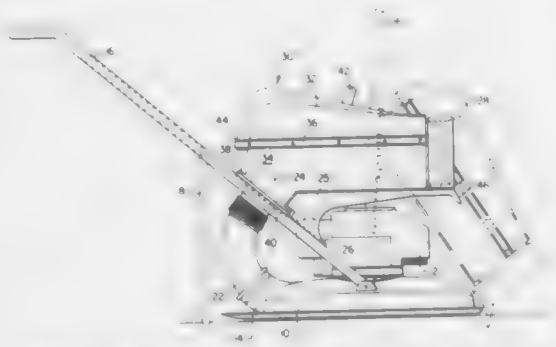
AIR-FLOATED CUTTING APPARATUS WITH OVERHEAD GRASS CATCHER

Arthur L. Fassauer, 420 Foster La., Canyon, Tex. 79015

Continuation-in-part of Ser. No. 395,799, Aug. 18, 1989, abandoned. This application Dec. 4, 1989, Ser. No. 445,460

Int. Cl.[5] A01D *75/00*

U.S. Cl. 56—12.1 **25 Claims**



1. A cutting apparatus for lawns with a grass catcher for clippings, comprising:

a housing for moving along the surface of the grass;

a cutting mechanism disposed in said housing for cutting the grass and creating clippings internal to said housing;

a primary discharge port for interfacing between the interior of said housing and the exterior thereof for discharging clippings at an angle of less than 45° relative to the surface of the ground;

means for discharging grass clippings from the interior of said housing out through said primary discharge port, said means for discharging tolerant to back pressure such that a high volumetric flow of grass clippings is maintained for a substantially wide range of back pressures on said primary discharge port;

a diverter for diverting the clippings from said primary discharge port to a secondary discharge port, said secondary discharge port oriented at an angle greater than 90° relative to the surface of the grass.

a substantially sealed receptacle having an inlet port for interfacing with said secondary discharge port, said receptacle for holding the clippings; and

means for supporting said receptacle relative to said housing

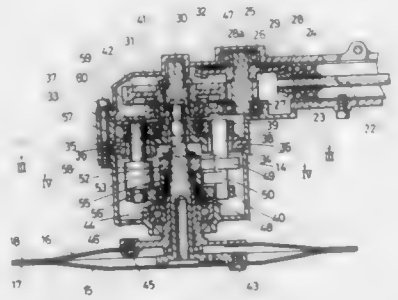
OSCILLATING-TYPE MOWING APPARATUS



Masaharu Nakamura, and Kazuo Kajimura, both of Tokyo, Japan, assignors to Komatsu Zenoah Company, Tokyo, Japan

Filed Mar. 26, 1990, Ser. No. 498,631

Claims priority, application Japan, Mar. 27, 1989, 1-71854; Jun. 2, 1989, 1-64005[U]

Int. Cl.[5] **A01D** *34/30, 34/84*

U.S. Cl. 56—17.6 **8 Claims**

1. A mowing apparatus, comprising;

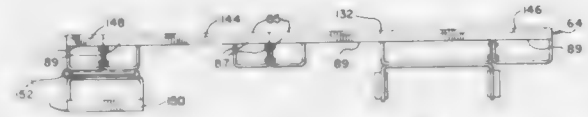
a motive power source for supplying rotating motion;

a pair of first and second cutting disks slidably supported with respect to each other, each of said disks including a plurality of peripheral cutting teeth;

means for reciprocatively oscillating said first and second cutting disks in opposite directions relative to each other within a predetermined oscillating range by the rotating motion of said motive power source; and

means for rotating said first and second cutting disks in one direction while said first and second cutting disks are oscillated reciprocatively by said reciprocatively oscillating means, said rotating means also being driven by the rotating motion of said motive power source through said reciprocatively oscillating means.

5,010,718



SYSTEM FOR MOUNTING AND SUPPORTING HARVESTING UNITS OF A COTTON HARVESTER

Michael J. Covington, LaGrange, and Jesse H. Orsborn, Hinsdale, both of Ill., assignors to J. I. Case Company, Racine, Wis.

Continuation-in-part of Ser. No. 280,372, Dec. 6, 1988. This application Nov. 13, 1989, Ser. No. 436,304

Int. Cl.[5] **A01D** *46/14*

U.S. Cl. 56—40 **15 Claims**

1 A system for mounting and supporting a harvesting unit for lateral movement while generally maintaining a predetermined disposition relative to a mobile frame of cotton harvester to harvest cotton from cotton plants, said system comprising:

a lift assembly pivotally connected to and extending forwardly from said frame;

an elongated tool bar assembly connected to said lift assembly to permit said tool bar assembly to be vertically moved relative to said frame, said tool bar assembly including at least one elongated support laterally extending across a forward end of said frame and configured to define at least three laterally extended and joined generally flat support surfaces extending between first and second ends of said support; and

mounting means arranged toward a rear end of said harvesting unit for mounting said harvesting unit to hang from said tool bar assembly, said mounting means including a a harvesting unit bracket assembly connected to a rearward end of said harvesting unit and configured with laterally extending support surfaces arranged in confronting relation to and slidably embracing each of said support surface defined by said elongated support in a non-point contact relationship whereby substantial surface area contact it provided between said bracket assembly and each of the support surfacers on said elongated support in a manner facilitating selective lateral sliding movement of said harvesting unit along and between ends of said support while inhibiting rotational movement of said harvesting unit about said tool bar assembly and thereby maintaining said predetermined disposition relative to said frame regardless of its lateral position along said support.

5,010,719

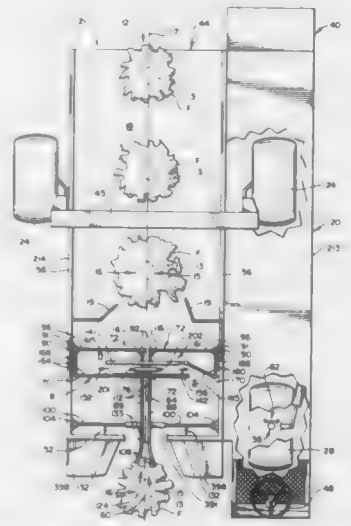
METHOD AND SYSTEM FOR AUTOMATICALLY STEERING ALONG ROW CROPS

Scott A. Korthuis, Lynden, Wash., assignor to Korvan Industries, Inc., Lynden, Wash.

Continuation-in-part of Ser. No. 302,588, Jan. 25, 1989, abandoned, which is a continuation of Ser. No. 202,116, Jun. 3, 1988, abandoned, which is a continuation of Ser. No. 875,631, Jun. 18, 1986, Pat. No. 4,750,322. This application May 19, 1989, Ser. No. 354,346

Int. Cl.[5] **B62D** *5/06*

U.S. Cl. 56—10.2 **20 Claims**



8. A crop tending machine having first and second sides and able to travel along a crop row having a crop row axis and first and second crop sides oppositely positioned relative to said crop row axis, said machine comprising:

a. a chassis arranged to travel along said crop row axis, said chassis defining a crop engaging region with an alignment location which is desirably near said crop row axis during operation of said machine;

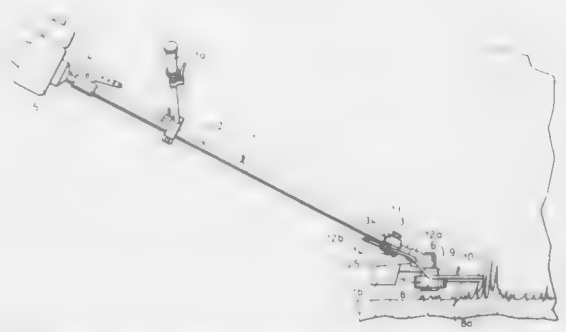
b. location sensing means responsive to location of said machine relative to said crop row axis and arranged to provide an output related to distance of said alignment location from said crop prow axis;

c. steerable wheel means for directing travel of said machine and mounted to said machine so as to be movable to, respectively, a first predetermined angular position or a second predetermined angular position that are angularly displaced relative to a straight ahead travel position, and which direct travel of said machine toward the first and second sides of the machine, respectively;

d. steering control means responsive to said location sensing means in a manner to move said steerable wheel means to

said first angular position when said sensing means senses the location of the machine to be more toward said second crop side and to maintain said wheel means in said first angular position until said sensing means senses the location of the machine is more toward said first crop side, at which time said steering control means moves said wheel means to said second angular position and maintains said wheel means in said second angular position until said machine is more toward said second crop side, in a manner to cause said machine to move in sequential curved path segments back and fourth.

5,010,720



TRIMMER GUARD AND GUIDE ASSEMBLY

Louis V. Corsi, 205 N. Charity St., Bethel, Ohio 45106

Continuation-in-part of Ser. No. 393,414, Aug. 14, 1989, abandoned. This application Jun. 26, 1990, Ser. No. 543,629

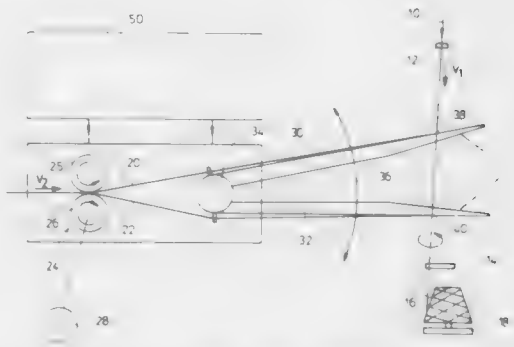
Int. Cl.[5] **A01D** *34/67*

U.S. Cl. 56—320.1 **18 Claims**

1 A guard and guide assembly for a powered operator hand-held grass and weed trimmer having a trimming means in the form of a flexible, string-like filament segment extending from a spool of said filament and having a free end, said trimmer comprising an elongated tubular body having forward and rearward ends, means to rotatively and releasably support said spool and trimming filament segment at said forward end of said trimmer body, prime mover means mounted on said trimmer and operatively connected to said spool to rotate said spool and filament segment at high speed in a circular path of travel, said guard and guide of said assembly comprising an element having a forward portion with an arcuate peripheral configuration and an upwardly, inwardly, and rearwardly extending rearward portion, said guard and guide assembly including means to operatively attach said guard and guide to said trimmer body, said guard and guide having an operative position wherein its arcuate portion extends away from said operator and overlies the forward portion of said circular path of travel of said filament segment and extends slightly beyond said free end of said filament segment.

5,010,721

ARRANGEMENT FOR THE GENERATION OF A YARN HAVING FANCY TWISTS ARRANGED AND/OR FORMED AT RANDOM



Friedrich Aalderink, Greenville, S.C., assignor to Eno Electronic GmbH, Fed. Rep. of Germany

Continuation of Ser. No. 218,632, Jul. 13, 1988, abandoned. This application Dec. 15, 1989, Ser. No. 453,182

Claims priority, application Fed. Rep. of Germany, Jul. 14, 1987, 3723243

Int. Cl.[5] **D02G** *3/36, 3/34*

U.S. Cl. 57—11 **1 Claim**

1. A device for producing a yarn having fancy twists arranged and/or formed at random, comprising

(a) cop means rotatable about an axis of rotation for winding the yarn on a winding body and cop drive means for driving said cop means about said axis of rotation,

(b) first thread guide means arranged approximately on said axis of rotation of said cop means for guiding basic yarn threads fed, said basic yarn threads being twisted by the rotation of said cop means to form a yarn and being wound on said winding body,

(c) second thread guide means supported by holding means and arranged between said first thread guide means and said cop means and movable along said basic yarn threads, said basic yarn threads from said first thread guide means passing through said second thread guide means, wherein said holding means comprise a fancy twist lever extending laterally from said basic yarn threads between said first thread guide means and said cop means and being pivotally mounted about an axis extending crosswise to said basic yarn threads wherein said second thread guide means is movably guided longitudinally of said fancy twist lever,

(d) means for feeding a fancy twist yarn thread,

(e) means for guiding said fancy twists yarn thread through said second thread guide means to be twisted with the basic yarn threads due to the rotation of said cop,

(f) a second fancy twist lever extending laterally from said basic yarn threads between said first thread guide means and said cop means and being pivotally mounted about an axis extending crosswise to said basic yarn threads,

(g) third thread guide means supported by said second fancy

twist lever, said basic yarn threads from said first thread guide means passing through said third thread guide means,

(h) means for feeding a second fancy twist yarn thread,

(i) means for guiding said second fancy twist yarn thread through said second thread guide means to be twisted with the basic yarn threads due to the rotation of said cop,

(j) said third thread guide means being movably guided longitudinally of said second fancy twist lever

(k) drive means for rocking said fancy twist levers substantially along said basic yarn threads and

(l) electronic control means for controlling said drive means, said control means comprising random generator means, whereby the rocking of the fancy twist levers takes place at random, said first and second fancy twist levers being controlled independently from each other in accordance with random distributions.

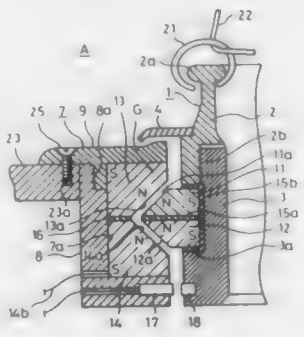
ROTARY RING WINDING DEVICE



Hiroshi Yamaguchi, 9-7, Ooyamada 4-chome, Kuwana-shi, Mie, and Masashi Yamaguchi, Osaka, both of Japan, assignors to Hiroshi Yamaguchi and Hiroshi Kimura, both of, Japan

Continuation of Ser. No. 402,346, Sep. 5, 1989, abandoned. This application Apr. 16, 1990, Ser. No. 511,943

Claims priority, application Japan, Sep. 5, 1988, 63-223249

Int. Cl.[5] D01H 7/56, 7/64

U.S. Cl. 57—124 14 Claims

1. An improvement in a ring winding device, which comprises a spindle, a ring rail able to be alternately displaced upward and downward along the axial direction of said spindle, a rotary ring member rotatably supported at said ring rail by a bearing device coaxially with said spindle, said rotary ring member being provided with a ring-shaped flange portion whereon a traveller for guiding a yarn can be slidably mounted, means for driving said spindle and means for displacing said ring rail, comprising:

a bearing device provided with a first annular magnetic member coaxially disposed therein and horizontal to an axial center thereof, and a rotary ring member provided with a second annular magnetic member coaxially disposed at an outside annular surface thereof at a position facing said first annular magnetic member,

said first annular magnetic member being provided with a horizontal annular recess, and said second annular magnetic member being provided with a radially projected annular portion having a radial cross-section such that said projected portion can be engaged in said annular recess of said first magnetic member with an air-gap therebetween,

said first annular magnetic member being divided into an upper annular portion and a lower annular portion with respect to said projected annular portion of said second annular magnetic member, at least one of said upper and lower annular portions of said first annular magnetic member being formed by an electric magnet, and the other portion of said first annular magnetic member and said second annular magnetic member being formed by permanent magnets respectively,

said electric magnet of said first annular magnetic member being capable of controlling a magnetic action thereof by controlling an exciting current applied thereto,

whereby said rotary ring member can be freely rotatably supported by said bearing by controlling said exciting current in the normal spinning operation, and a brake force can be applied to said free rotation of said rotary ring member by controlling said exciting current.

TWISTED YARN WHICH WILL MAINTAIN ITS TWIST AND PRODUCTS PRODUCED THEREFROM

Joseph M. Wilen, Atlanta, Ga., assignor to Wilen Manufacturing, Atlanta, Ga.

Filed Oct. 26, 1989, Ser. No. 427,728

Int. Cl.[5] D02G 3/40

U.S. Cl. 57—210 1 Claim

1. A twisted yarn which is suitable for use in a mop and which is absorbent, flexible and does not readily untwist comprising:

(a) a pair of individually twisted plies formed of cellulosic fibers, said plies being twisted together to form a balanced double helix yarn, the outer portions of said twisted plies remaining hydrophilic;

(b) a thermoplastic binder in the interior of said yarn and around which said plies pass, said binder binding only the inner portions of said plies together;

(c) said cellulosic fibers being selected from the group consisting of cotton fibers and cotton rayon fibers;

(d) the twist of each ply being from about 2 twists per inch to about 4 twists per inch;

(e) said twisted yarn having from about 1 to about 2 twists per inch; and

(f) said thermoplastic binder being selected from the group consisting of polyethylene and polyproplylene having a melting point from about 170° F. to about 205° F.

5,010,724

METHOD AND APPARATUS FOR PRODUCING PACKAGES

Arthur Rebsamen, Stallikon, Switzerland, assignor to Machinenfabrik Schweiter AG

Filed Dec. 16, 1988, Ser. No. 285,191

Claims priority, application Switzerland, Dec. 16, 1987, 4899/87

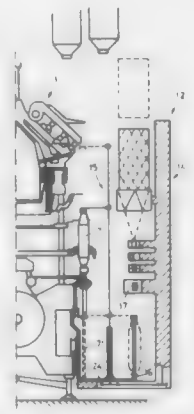
Int. Cl.[5] D01H 9/10

U.S. Cl. 57—270 2 Claims

1. Method for producing packages, comprising the steps of:

providing a plurality of yarn carriers,

providing a ring spinning frame and a group of spinning stations,



spinning the yarn carriers in the spinning stations,

providing a rewinding station cooperating with said group of spinning stations, said rewinding station including a holder for receiving a yarn carrier,

providing gripping means for handling a yarn carrier,

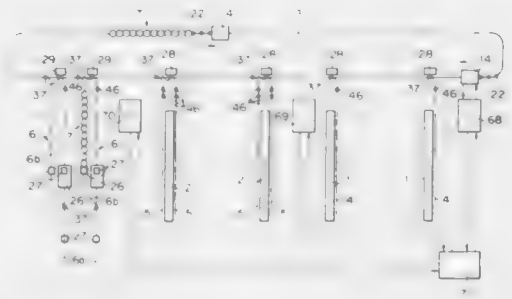
taking up the yarn carrier by said gripping means in case of a thread break, a batch change and a full yarn carrier and conveying the yarn carrier to the holder forming part of the rewinding station, and

rewinding the yarn carrier in the rewinding station to produce packages, wherein

the gripping means is moved with the rewinding station along the spinning stations.

5,010,725

SYSTEM FOR TRANSPORTING ROVING BOBBINS BETWEEN ROVING AND SPINNING PROCESSES



Yoshiharu Yasui; Katsumi Nakane; Osamu Suzuki, and Masahiko Kimbara, all of Kariya, Japan, assignors to Kabushiki Kaisha Toyoda Jidoshokki Seisakusho and Nisshinbo Industries, Inc., both of Tokyo, Japan

Continuation of Ser. No. 241,696, Sep. 7, 1988, abandoned. This application May 29, 1990, Ser. No. 530,462

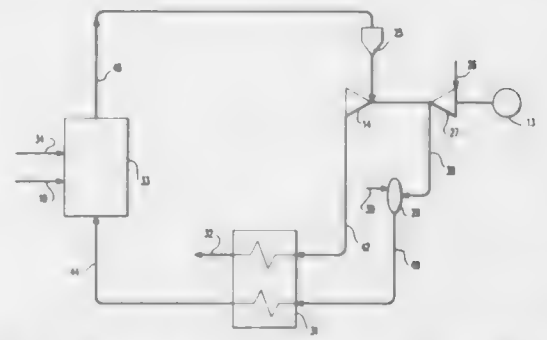
Claims priority, application Japan, Sep. 12, 1987, 62-229187

Int. Cl.[5] D01H 9/18

U.S. Cl. 57—281 5 Claims

1. A system for transporting roving bobbins in a cyclic manner between a roving process and a spinning process, in which the roving bobbins are transported, while suspended from a carrier, along a main rail arranged to form in endless loop and working rails branched from the main rail, the working rails comprising a roving frame rail and a spinning frame rail the improvement comprising—said carrier comprising a plurality of support members, connected to each other, each support member comprising a bobbin hanger suspended from the bottom of the support member, said carrier having a means for detachable connection with a tractor having detachable connection means at a back end thereof for detachable connection with the carrier, the tractor movable along the main rail, means disposed on the main rail for representing the respective working rail address, which are detected by a sensor mounted on the tractor; and a station, disposed at least in the inlet area of the roving and spinning processes, respectively, said station transmitting a command when the tractor reaches a position corresponding to the station, the command issued from a central control unit supervising the system to the tractor, said command being prepared in accordance with information regarding the conditions of the tractor and of the respective frames and working rails and said command also including information regarding the working rail address requiring transportation of a carrier.

5,010,726



SYSTEM AND METHOD FOR EFFICIENTLY GENERATING POWER IN A SOLID FUEL GAS TURBINE

Richard V. Garland, Chuluota, Fla., assignor to Westinghouse Electric Corp., Pittsburgh, Pa.

Continuation of Ser. No. 250,277, Sep. 28, 1988, Pat. No.

Int. Cl.[5] F02C 7/10

U.S. Cl. 60—39.05 5 Claims

1. A method for generating electrical power utilizing a compressor, spray evaporator, turbine, pressurized fluidized bed combustor (hereinafter PFBC), regenerator, dynamo-electric machine, and solid fuel, comprising the steps of:

(a) compressing and heating air in said compressor;

(b) cooling said hot compressed air in said spray evaporator, thereby producing cooled compressed air of increased mass flow;

(c) heating said cooled compressed air in said regenerator, thereby producing heated compressed air;

(d) fluidizing and burning said solid fuel in said PFBC using said heated compressed air to fluidize said solid fuel and provide oxygen for said burning, thereby producing hot compressed combustion gas;

(e) expanding said hot compressed combustion gas in said turbine, thereby producing rotating shaft power and expanded combustion gas;

(f) cooling said expanded combustion gas in said regenerator; and

(g) converting said rotating shaft power to electrical power in a dynamo-electric machine.

5,010,727

METHOD FOR EVALUATING THE WORKING LINE CHARACTERISTICS OF A COMPRESSOR OF A GAS TURBINE ENGINE

Michael J. Cox, Derby, England, assignor to Rolls-Royce PLC, London, England

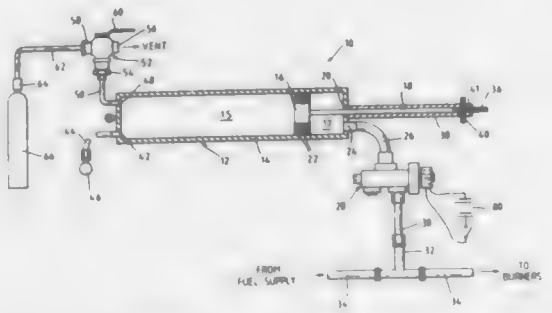
Division of Ser. No. 150,238, Jan. 29, 1988, Pat. No. 4,856,274. This application May 31, 1989, Ser. No. 359,144

Claims priority, application United Kingdom, Mar. 23, 1987, 8706878

Int. Cl.[5] F02C 7/00

U.S. Cl. 60—39.06 2 Claims

1. A method of evaluating the working line characteristics of a compressor of a gas turbine engine comprising the steps of:



supplying fuel from the engine's normal fuel tank to a fuel accumulator, the fuel accumulator being connected to the engine during the evaluation;

pressurizing the fuel in the fuel accumulator;

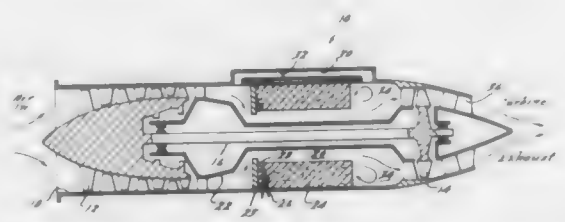
measuring the pressure of the fuel in the accumulator;

supplying the fuel in the accumulator to a combustion chamber of the gas turbine engine to increase the pressure in the combustion chamber; and

determining whether said measured pressure of fuel in the fuel accumulator results in a pressure increase in said combustion chamber sufficient to induce a surge in said compressor,

wherein the pressure of the pressurized fuel in the fuel accumulator sufficient to induce any such surge is indicative of said working line characteristics of said compressor.

5,010,728



SOLID FUEL TURBINE ENGINE

John R. Joy, Brighton, Mich., assignor to Williams International Corporation, Walled Lake, Mich.

Filed Oct. 18, 1985, Ser. No. 7[illegible],315

Int. Cl.[5] F02G *1/00*

U.S. Cl. 60—39.464 **3 Claims**

1. A solid fuel turbine engine comprising

a centrally disposed axially extending rotatable compressor drive shaft,

an annular combustion chamber having an inlet end and an outlet end and disposed about said compressor drive shaft intermediate the ends thereof,

the annular configuration of said combustion chamber being defined by a pair of radially spaced, cylindrical walls which are concentric with one another and with said shaft,

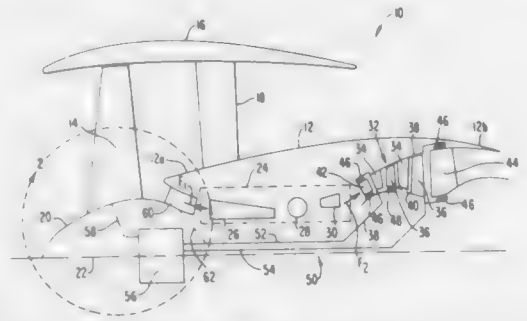
an annular solid fuel charge in said combustion chamber for producing combustion gases,

an expansion chamber at the outlet end of said combustion chamber and axially aligned therewith,

a compressor on said shaft at the inlet end of said combustion chamber for delivering air to said combustion chamber to provide the principal source of oxygen for combustion, and

a turbine on the other end of said shaft at the outlet end of said combustion chamber driven by said combustion gases and driving aid compressor.

5,010,729



GEARED COUNTERROTATING TURBINE/FAN PROPULSION SYSTEM

Arthur P. Adamson; Lawrence Butler, both of Cincinnati, and Robert A. Wall, Wyoming, all of Ohio, assignors to General Electric Company, Cincinnati, Ohio

Filed Jan. 3, 1989, Ser. No. 292,802

Int. Cl.[5] F02K *3/72*

U.S. Cl. 60—226.1 **9 Claims**

1 An axial flow fan jet engine comprising:

at least one set of fan blades for providing by-pass air and thrust;

a core portion for generating hot combustion gases, the core portion including a high pressure compressor for providing compressed air, a combustor for combusting the compressed air with fuel to produce the combustion gases, and a turbine for driving the high pressure compressor;

counterrotating turbine means mounted rearwardly of the engine core portion and disposed to be driven by the hot combustion gases exiting said engine core portion, said counterrotating turbine means including at least one set of first turbine blades configured and mounted to rotate in one angular direction relative to the engine axis, and at least one set of second turbine blades positioned axially adjacent said first blade set and configured and mounted to rotate in the opposite angular direction;

high speed shaft means operatively connected to said counterrotating turbine means and extending axially to a position forward of the engine core portion, said high speed shaft means including at least two counterrotating shaft members each connected to be driven by a respective one of said first blade set and said second blade set; and

reduction gear means positioned forwardly of the core engine portion and operatively connected to be driven by both of said two shaft members, said reduction gear means including output means operatively connected to drive said fan blades at a rotational speed less than the rotational speed of either of said two shaft members;

wherein said reduction gear means includes a pair of cooperating planetary gear assemblies, each of said assemblies having a rotatable sun gear, a ring gear, and set of planetary gears disposed between the the respective ring gear and sun gear, each of said sun gears being operatively connected to be driven by a respective one of said two shaft members.

5,010,730

GAS-FED HYBRID PROPULSION SYSTEM

William H. Knuth, and John H. Beveridge, both of Huntsville, Ala., assignors to Acurex Corporation, Mountain View, Calif.

Continuation of Ser. No. 159,782, Feb. 24, 1988, abandoned. This application Nov. 7, 1989, Ser. No. 434,526

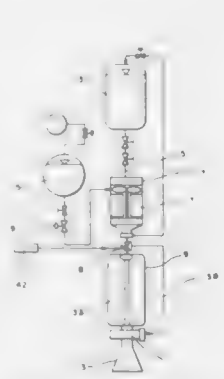
Int. Cl.[5] F02K *5/00*

U.S. Cl. 60—246 **23 Claims**

1. A self contained propulsion system comprising:

a solid propellant grain;

a motor casing for containing the solid propellant grain;



a first fluid propellant that will combust with the solid propellant when ignited, said first fluid propellant being stored in a liquid form apart from the solid propellant;

gasification means for gasifying substantially all of the first fluid propellant before the propellant is delivered to the motor casing;

delivery means for delivering at least a portion of the gasified fluid propellant from the gasification means to the motor casing in the region of the solid propellant grain;

ignition means for initiating burning of the combined propellants;

a first fluid storage tank for storing the liquified first propellant;

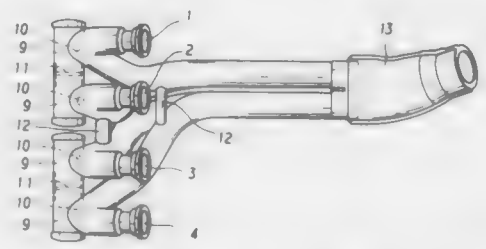
a second fluid propellant that will combust with the first fluid propellant when ignited;

a second fluid storage tank for storing the second fluid propellant; and

wherein said gasification means mixes a flowstream of said first fluid propellant with a flowstream of the second fluid propellant and combusts the mixture to produce a gasified propellant flowstream, the gasification means including a preburner wherein said first and second fluid propellants are combined and partially burned to gasify the combustion products and substantially all of the unburned first fluid propellant flowstream.

5,010,731

EXHAUSTING APPARATUS OF FOUR-CYCLE FOUR-CYLINDER ENGINE



Kazuhiko Onishi, Toyohashi, Japan, assignor to Suzuki Jidosha Kogyo Kabushiki Kaisha, Kamimura, Japan

Filed Feb. 26, 1990, Ser. No. 484,9[illegible]

Claims priority, application Japan, Mar. 1, 1989, 1-46676

Int. Cl.[5] F02B *27/02*

U.S. Cl. 60—313 **9 Claims**

1. An exhausting apparatus of a four-cycle, four-cylinder engine having four cylinders each of which is provided with an exhaust port, comprising:

four exhaust pipes connected to corresponding ones of said exhaust ports of said engine cylinders, said four exhaust pipes being separated into first and second groups, each group including two exhaust pipes, in accordance with ignition timings, said first and second groups of said exhaust pipes being shifted by means of an angle of 360°;

exhaust chamber means including exhaust chambers in communication with front portions of said exhaust pipes respectively through means of communication holes;

two communication pipes, one connecting said first group of said exhaust pipes, and the other one connecting said second group of said exhaust pipes;

a collecting cylinder means to which downstream ends of said exhaust pipes are connected;

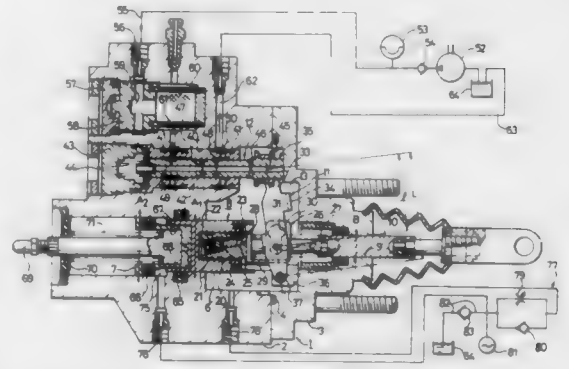
a separator means separating an interior portion of said collecting cylinder means into two sections within which said first and second groups of said exhaust pipes are disposed, respectively;

a collecting exhaust pipe connected to a downstream end of said collecting cylinder means; and

a muffler means mounted upon said collecting exhaust pipe.

5,010,732

HYDRAULIC PRESSURE BOOSTER WITH A RESTRICTOR PRODUCING A BRAKING SENSATION



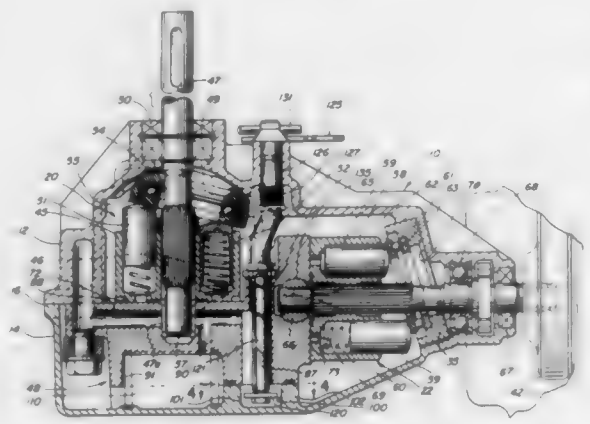
Isao Yagi, Saitama, Japan, assignor to Jidosha Kiki Co., Ltd., Tokyo, Japan

Filed May 4, 1989, Ser. No. 347,494

Claims priority, application Japan, May 19, 1988, 63-122275

Int. Cl.[5] F16D *31/02*

U.S. Cl. 60—413 **4 Claims**



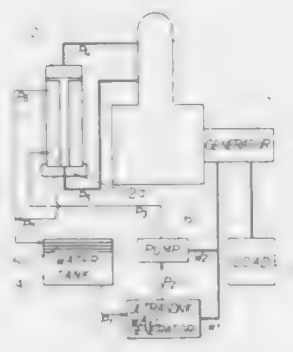
1. A hydraulic pressure booster comprising a first piston of a smaller diameter and a second piston of a greater diameter which are disposed in a housing so as to be reciprocable in a common direction and which are disposed in abutment against each other, a first power chamber formed in one free end of the first piston, a second power chamber formed in the other end of the first piston which is disposed for abutment against the second piston, a communication passage providing a communication between the first and the second power chambers, and a control valve adapted to be operated as a result of a mechanical connection with an input shaft for introducing a hydraulic pressure into the first power chamber having a magnitude which depends on the magnitude of an input force applied to the input shaft to thereby drive the first piston forward, the hydraulic pressure introduced into the first power chamber being introduced into the second power chamber through the communication passage; wherein an orifice which retards the introduction of the hydraulic pressure from the first to the second power chamber, and a check valve which allows a flow of a pressure fluid from the second to the first chamber are connected in shunt with each other in the communication passage.

5,010,733

HYDROSTATIC TRANSMISSION WITH HYDRAULIC BYPASS AND AIR BLEED

Alan W. Johnson, Ames, Iowa, assignor to Sauer-Sundstrand Inc., Ames, Iowa

Filed Mar. 24, 1989, Ser. No. 328,470
Int. Cl.[5] F16D *31/02*
U.S. Cl. 60—453 10 Claims



1. A hydrostatic transmission comprising, a housing with a sump, a pair of hydraulic displacement units in said housing each having a rotatable cylinder block, means extending between said cylinder blocks providing a pair of ports coacting with each cylinder block, a first fluid passage connecting one port of each pair, a second fluid passage connecting the second ports of each pair, a housing recess at the bottom of the housing for holding filtered make-up oil, a pair of bypass valves normally closed to prevent flow of pressure fluid from either of said first and second passages to said housing recess, means operable to open said bypass valves to connect the first and second passages for a bypass operation, a passage extending upwardly from said housing recess and opening to the upper interior of the housing, movable seal means at the upper end of the passage for sealing the passage, and means for opening the seal means in response to opening the bypass valves.

5,010,734

COOLING SYSTEM FOR A STIRLING ENGINE

Kwang S. Ho, Seoul, Rep. of Korea, assignor to Goldstar Co., Ltd., Seoul, Rep. of Korea

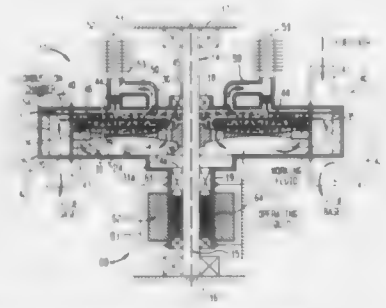
Filed Aug. 22, 1990, Ser. No. 570,729
Claims priority, application Rep. of Korea, Aug. 31, 1989, 12573/1989
Int. Cl.[5] F02G *1/055*
U.S. Cl. 60—517 3 Claims

1. A cooling system for a Stirling engine with working fluid, which comprises:

a cooler attached to said Stirling engine,

an ultrasonic wave generator for making liquid into atomized particles of liquid,

a liquid tank for feeding liquid to said ultrasonic wave generator, and



a pump for pumping said atomized particles of liquid produced from said ultrasonic wave generator so as to circulate to said cooler attached to the Stirling engine, whereby working fluid of the Stirling engine is effectively cooled.

5,010,735

CENTRIFUGAL HEAT ENGINE AND METHOD FOR USING THE SAME

Gad Assaf, Rehovot, Israel, assignor to Geophysical Engineering Company, Seattle, Wash.

Filed Oct. 6, 1989, Ser. No. 418,268
Int. Cl.[5] F01K *11/04*
U.S. Cl. 60—669 32 Claims

1 A centrifugal heat engine comprising:

(a) a first member rotatably mounted on a second member;

(b) said first member having an annular chamber on its periphery containing a vaporizable working fluid, and a central chamber separated from the annular chamber by a bulkhead, said central chamber containing an operating liquid;

(c) an hydraulic turbine mounted on said second member and projecting into said central chamber for dividing the same into two axially displaced compartments each of which contains operating liquid;

(d) heating means for heating and vaporizing the working fluid in said annular chamber;

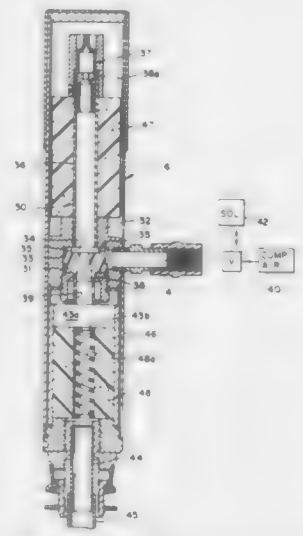
(e) conduit means for conducting vaporized working fluid produced in said annular chamber into one of said compartments wherein the vaporized working fluid expands in the operating liquid producing a liquid/gas mixture in said one compartment, rotation of said first member relative to the second member creating a pressure differential between said two compartments which is related to the rotational speed of the first member and the density distribution of the fluids in the second compartment; and

(f) flow means on said turbine and said first member for effecting a flow path for operating fluid between said compartments in response to said pressure differential thereby imparting rotation to said first member which creates said pressure gradient in said operating fluid.

5,010,736

COOLING SYSTEM FOR ENCLOSURES

Michael L. York, Fairfield, and Steven E. Broerman, Mason, both of Ohio, assignors to Vortec Corporation, Cincinnati, Ohio



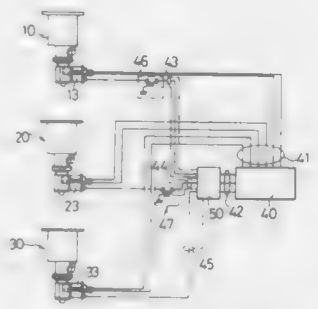
Filed Apr. 16, 1990, Ser. No. 509,902
Int. Cl.[5] F25B *9/02*
U.S. Cl. 62—5 10 Claims

1. A cooling system for cooling the inside of an enclosure, said system comprising:

a housing defining a first chamber and an inlet and outlet for the first chamber for communication with the enclosure;

a first cooling assembly secured to the housing and including evaporator means disposed in the first chamber for extracting heat from a fluid which flows from the enclosure through the inlet of the first chamber and condenser means for discharging the heat extracted by the evaporator means; and

a second cooling assembly including a vortex tube with a hot portion, a cold portion, and a generator portion disposed between the hot and cold portions, the cold portion being in fluid communication with the enclosure;



said second cooling assembly including temperature sensing means disposed proximate the inlet of the first chamber for sensing the temperature of fluid flowing into the first chamber from the enclosure and control means connected to the temperature sensing means for controlling the operation of the vortex tube so that the vortex tube operates at a predetermined temperature of the fluid flowing into the first chamber.

5,010,737

MULTI-HEADED CRYOPUMP APPARATUS

Nobuo Okumura, Toyota, and Atsuyuki Miura, Hazu, both of Japan, assignors to Aisin Seiki Kabushiki Kaisha, Kariya, Japan

Filed Mar. 30, 1990, Ser. No. 501,778
Claims priority, application Japan, Mar. 30, 1989, 1-080560
Int. Cl.[5] F25B *9/00*
U.S. Cl. 62—6 3 Claims

1 A multi-headed cryopump apparatus comprising:

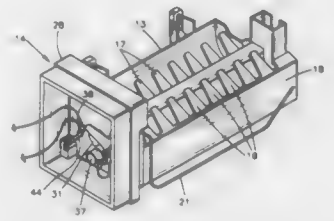
a plurality of cryopumps;

a common compressor connected to each of the plurality cryopumps;

a plurality of valve means each of which is interposed between each cryopump and the compressor;

a plurality of motors for driving a corresponding cryopump;

a plurality of current detecting sensors for detecting the current supplied to a corresponding motor; and



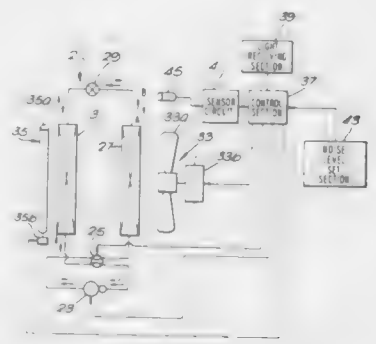
a control unit for controlling the operation of each valve means on the basis of the result of each current detecting sensor in such manner that the plural valve means operate in turn with a constant cycle.

5,010,738

ICE MAKER WITH THERMAL PROTECTION

Ralph W. Brown, Orleans; Sammie C. Beach, Gowen, and Gary R. Peter, Rockford, all of Mich., assignors to White Consolidated Industries, Inc., Cleveland, Ohio

Filed Mar. 23, 1990, Ser. No. 498,204
Int. Cl.[5] F25C *1/24*
U.S. Cl. 62—135 10 Claims



8. An ice maker comprising an aluminum mold having cavities in which water is frozen to form ice cubes, a heater in heat exchange relationship with said mold operable to heat said mold and melt said ice cubes along the interface therewith to allow removal of said ice cubes from said mold, a non-metallic control housing having an inner wall in abutting relation with a portion of said mold and defining a closed chamber, said inner wall having openings therein exposing surface portions of said aluminum mold to said chamber, controls in said chamber including a first control positioned in an opening in said inner wall operable to energize said heater when ice cubes are frozen in said cavities and to subsequently de-energize said heater, and a thermal fuse in said chamber mounted in an opening in said inner wall abutting an adjacent surface of said mold and operating to de-energize said heater when excessive temperatures occur.

5,010,739

AIR CONDITIONING APPARATUS HAVING AUDIBLE SOUND LEVEL CONTROL FUNCTION

Masao Isshiki, Shizuoka, and Takeshi Kumazawa, Tokyo, both of Japan, assignors to Kabushiki Kaisha Toshiba, Kanagawa, Japan

Filed Jun. 14, 1990, Ser. No. 538,257
Claims priority, application Japan, Jun. 30, 1989, 1-169660; Jul. 26, 1989, 1-191274
Int. Cl.[5] G05D *23/32*
U.S. Cl. 62—158 12 Claims

1. An air conditioning apparatus comprising:

means for conditioning air circulating in a closed space, the

conditioning means radiating a variable level of audible sound during its operation;

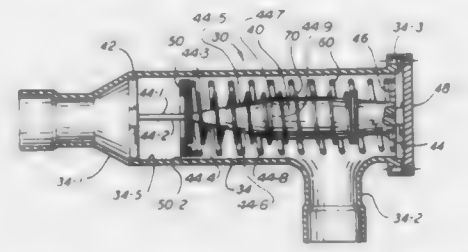
sound sensor means for detecting an actual audible sound value (Na) including the audible sound value from the conditioning means while the conditioning means is operated and a background audible sound value (Nb) which is a sound value when the conditioning means is stopped;

memory means for previously storing a predetermined audible sound value (Ns);

means for modifying the predetermined audible sound value to output a modified audible sound value (Ns');

means for comparing the actual audible sound value (Na) with one of the predetermined audible sound value (Ns) and the modified audible sound value (Ns'); and

control means for reducing the level of the audible sound from the conditioning means when the actual audible sound value is greater than one of the predetermined audible sound value and the modified audible sound value



---

5,010,740

REFRIGERATION SYSTEM WITH MASS FLOW LIMITING DEVICE

Robert J. Backus, Dewitt; Robert A. Chopko, Liverpool; Alan S. Drucker, Dewitt, and Chester D. Ripka, Syracuse, all of N.Y., assignors to Carrier Corporation, Syracuse, N.Y.

Filed Feb. 7, 1990, Ser. No. 475,566
Int. Cl.[5] F25B *41/04*, D03D *39/10*
U.S. Cl. 62—217 **7 Claims**

1. A closed refrigeration system containing refrigerant comprising:

compressor means for compressing said refrigerant and including an inlet and an outlet;

means for driving said compressor means;

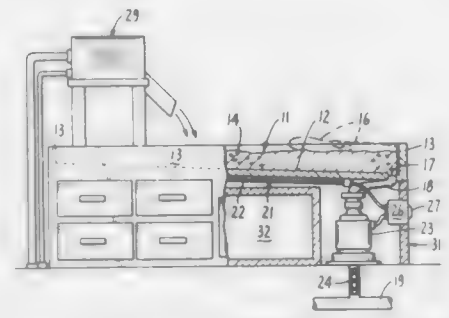
said closed refrigeration system defining a refrigerant circuit whereby said refrigerant compressed by said compressor means passes from said outlet serially through condenser means, expansion means, evaporator means and flow limiting means before returning to said compressor means via said inlet;

said flow limiting means including:

a housing having an inlet connected to said evaporator means, an outlet connected to said compressor and with a flow path connecting said inlet and said outlet of said housing;

an elongated member axially located in said flow path and serially having a fixed cross section portion and a variable cross section portion in an axial downstream direction with said variable cross section portion increasing in going from said inlet of said housing towards said outlet of said housing for at least a portion of the length of said elongated member;

annular means in said housing having an aperture receiving said fixed and variable cross section portions of said elongated member and coacting therewith to define a flow path;



biasing means acting on said annular means to bias said annular means towards said inlet of said housing whereby refrigerant entering said housing passes through said flow path defined by said aperture and said elongated member creating a differential pressure across said annular means tending to move said annular means in a downstream direction towards said outlet of said housing to restrict said flow path defined by said annular means and said variable cross section portion of said elongated member in opposition to said biasing means so that said inlet of said compressor is always supplied with refrigerant at an essentially constant pressure when said annular means is coacting with said variable cross section portion.

5,010,741

CHILLED FOOD DISPLAY COUNTER

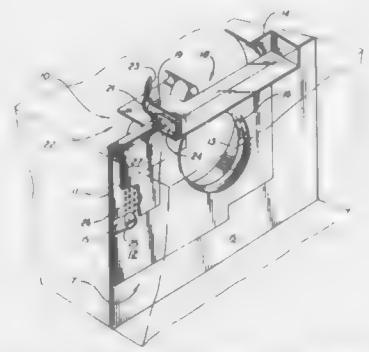
Lori J. Gelatini, 4637 Greenbush Dr., Concord, Calif. 94521

Filed Jul. 31, 1990, Ser. No. 560,344
Int. Cl.[5] A47F *3/04*
U.S. Cl. 62—246 **6 Claims**

1. A counter for displaying chilled foods on a bed of ice, comprising

a waterproof tray portion having a generally flat bottom surrounded by an upstanding wall of sufficient height for said tray to contain a bed of ice of desired depth upon which chilled foods are displayed for sale,

said bottom of said tray being flatly inclined downwardly to a drain opening,



a drain conduit communicating with said drain opening and adapted for discharging into a waste water drain, and heating means operatively connected to said tray for melting the ice therein when said chilled food is removed from said bed of ice at the end of the day.

5,010,742

ACTUATION MECHANISM FOR VENT AND EXHAUST DOORS

Theodore S. Bolton, Liverpool, and Curtis L. Tobin, Sr., Chittenango, both of N.Y., assignors to Carrier Corporation, Syracuse, N.Y.

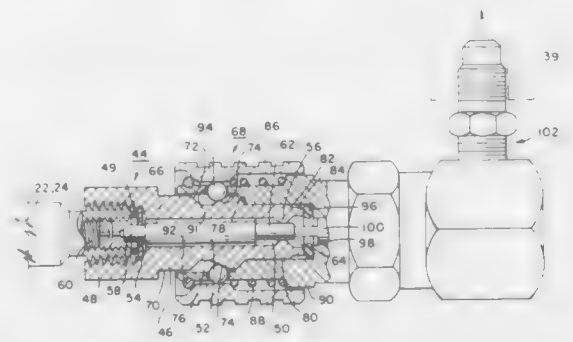
Filed Feb. 8, 1988, Ser. No. 153,745
Int. Cl.[5] F25D *23/12*
U.S. Cl. 62—262 **20 Claims**

1. In a room air conditioner of the type having a partition dividing indoor and outdoor sections and having vent and exhaust openings for exhausting room air into the outdoor section and for venting outdoor air into the indoor section an improved control mechanism comprising:

a scroll structure mounted in the indoor section and having the vent and exhaust openings integrally formed therewith, said vent opening being so disposed as to selectively provide fluid communication from said outdoor section to said indoor section, and said exhaust opening being so disposed so as to provide fluid communication from said indoor section to said outdoor section;

a vent door mounted on said scroll structure for selectively opening or closing said vent opening;

an exhaust door mounted to said scroll structure for selectively opening or closing said exhaust opening; and



an actuator mechanism mounted to said scroll structure and mechanically linked to said vent and exhaust doors to selectively operate them between open and closed positions.

5,010,743

TEST FITTING ADAPTER FOR REFRIGERANT LINES

Phillip L. Hale, Rowlett, Tex., assignor to Richard E. Glaser, Dallas, Tex., a part interest

Filed Dec. 15, 1989, Ser. No. 451,291
Int. Cl.[5] F25B *45/00*
U.S. Cl. 62—292 **4 Claims**

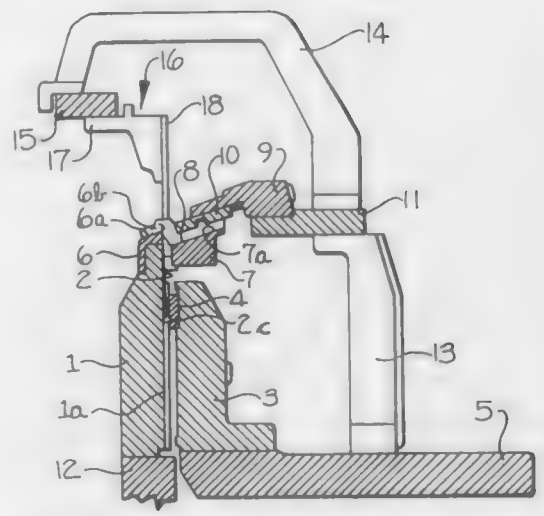
1. In a system for diagnostic servicing a vehicular refrigeration unit having a male threaded service connector and located in the engine vicinity within the engine compartment of the vehicle by obtaining a pressure measurement of the refrigerant gas contained in the unit including a pressure gauge, flexible tubing secured in communication with said pressure gauge, and a coupling at the distal end of said tubing for attaching said tubing to a threaded service connector of a vehicular refrigeration unit to be serviced, the improvement for placement intervening the service connector and the tube coupling comprising:

an adapter fitting having a threaded female connector at one end for effecting a pressure tight attachment to the service connector of the refrigeration unit and having an unthreaded male configured opposite end for receipt of a female quick disconnect tubular coupler; and

a female quick disconnect coupler to which the distal end of said tubing can be attached and adapted to effect a quick joinder at said opposite end of said adapter fitting with the coupling of said tubing.

5,010,744

METHOD OF CONSTRUCTING PLATING PILE KNIT FABRIC AND SINKER THEREFOR



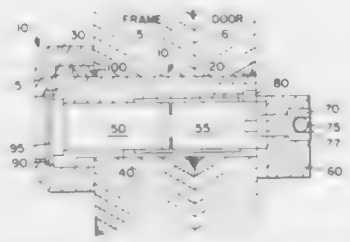
Shinji Kawase, and Shyozo Yorisue, both of Hyogo, Japan, assignors to Precision Fukuhara Works, Ltd., Japan

Filed Jan. 12, 1990, Ser. No. 464,242
Claims priority, application Japan, Mar. 13, 1989, 1-61434
Int. Cl.[5] D04B *9/12*
U.S. Cl. 66—93 **4 Claims**

1. A method of constructing a plated pile knit fabric on a circular knitting machine fitted for feeding a ground yarn and a pile yarn, with the knitting machine having sinkers obliquely movable from an advanced, innermost lower position to a receded, outermost upper position, and wherein each sinker includes a forward end portion having a throat extending transversely inwardly thereat to define a downwardly extending sinker nose positioned above the throat and a substantially horizontally extending upper pile position control ledge positioned rearwardly of the nose for engaging a pile yarn and determining the height of a formed pile yarn loop, and a sinker top knitting ledge surface defined by a lower surface of the throat for engaging a ground yarn and properly positioning the yarn onto a knitting needle and ensuring plating of the knit fabric, the method comprising the steps of

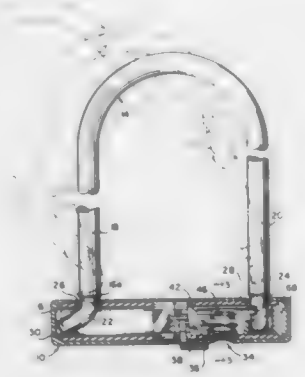
(a) feeding a ground yarn and pile yarn to a raised, open latch needle hook having previously formed ground yarn loops and pile yarn loops positioned on the needle stem,

(b) lowering the needle so that the previously formed ground yarn loops and the pile yarn loops rise on the needle stem and close the needle latch onto the ground and pile yarns fed thereto while also obliquely advancing the sinker so that the pile yarn is received onto the upper pile position control ledge of the sinker and the ground yarn is received into the sinker throat and onto the sinker top knitting ledge, and both yarns are positioned higher than the hook of the needle.



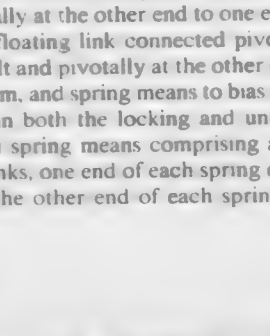
(c) transferring the ground yarn to the inner side of the needle hook by further advancing the sinker as the needle is lowered so that the ground yarn received in the sinker throat is moved forwardly toward the inner side of the needle hook as the sinker advances,

(d) lowering the needle to clear the previously formed ground and pile yarn loops from the needle while tightening the cleared loops with the sinker by advancing the sinker to the most advanced, innermost lower position,



(e) raising the needle so that the formed pile and ground loops are transferred to the needle stem and receding the sinker after the needle reaches a desired safety level so that as the needle is raised, the upper pile position control ledge and the sinker top knitting ledge is positioned lower than the needle hook and the formed pile loop received onto the pile position control ledge is cleared therefrom, and wherein the sinker is obliquely moved so that the sinker top knitting ledge always intersects the needle obliquely whereas the pile position control ledge intersects the needle horizontally and is displaced upward when receding the sinker inwardly and displaced downward while advancing the sinker outwardly.

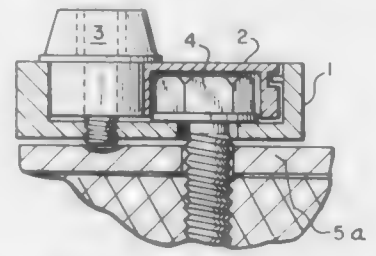
5,010,745
HIGH SECURITY POST LOCK
Charles E. Hall, Salem, and Stevie C. Roop, Dugspur, both of Va., assignors to Medeco Security Locks, Inc., Salem, Va.
Filed Aug. 2, 1989, Ser. No. 388,495
Int. Cl.[5] E05B *67/36*
U.S. Cl. 70—32 7 Claims



1. A high security post lock of the type including:
a shell means for passing through a door and securing the door against undesired movement;
a head member disposed at a first end of said shell means;
a locking cam rotatably mounted at a second end of said shell means and moveable from a first position wherein the cam is coextensive with the shell means to a second position wherein the cam projects outwardly from the shell means;
and a lock actuator means housed within the shell means and in engagement with the head member and the locking cam [means] for selectively securing the locking cam against rotation;
with improvements in control of the locking cam wherein rotation of the locking cam relative to the shell is limited by a pin movable in an arcuate groove, the pin and groove being on facing portions of the shell means and locking cam.

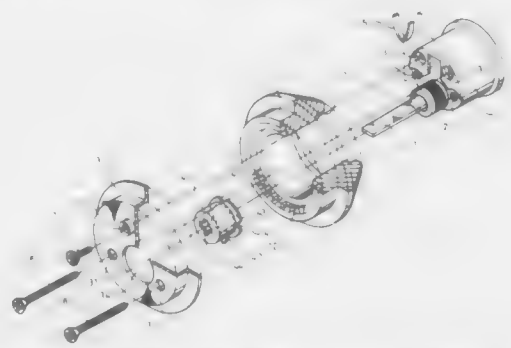
5,010,744
BICYCLE LOCK
Michael S. Zane, Cambridge, and Peter L. Zane, Hingham, both of Mass., assignors to Kryptonite Corporation, Boston, Mass.
Filed Apr. 25, 1990, Ser. No. 514,175
Int. Cl.[5] F05B *67/04*
U.S. Cl. 70—39 22 Claims

1. A bicycle lock comprising:
(a) a U-shaped shackle and a cross bar designed to lock across the open end of said shackle;
(b) said shackle formed with a pair of legs, one of said legs formed at its free end with means for securing said shackle at said free end to one end of said cross bar, said means also serving as a fulcrum to allow for a tilting motion between said shackle and said cross bar, the other of said legs formed at its free end with a lock engaging portion;
(c) a locking mechanism mounted in the side of said cross bar in between said pair of legs of said shackle;
(d) said locking mechanism including a dead bolt designed to engage said lock engaging portion of said other of said legs of said shackle, said dead bolt having two operative positions: a locking position in which said bolt extends into said lock engaging portion and, a non-locking position in which said bolt is withdrawn from said lock engaging portion, said dead bolt is designed to reciprocate between said two operative positions as effected by said locking mechanism when it is manipulated by a detachable key; and
(e) means removably to secure said locking mechanism within said cross bar.



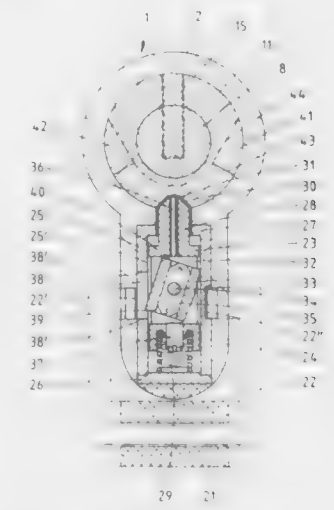
5,010,747
SECUR A DOOR POLICE LOCK
H. Peter Norden, Jr., 3 Crest Hill Pl., Smithtown, N.Y. 11787
Filed Feb. 5, 1990, Ser. No. 475,257
Int. Cl.[5] E05B *65/00*
U.S. Cl. 70—94 6 Claims

1. In combination with an inwardly or outwardly opening door mounted in the opening of a room or a building having a frame forming said opening in which said door is mounted, said frame including door jamb means having a portion thereof extending inwardly so that said door when shut is flush against one surface of said portion, door locking means comprising a lever arm pivotally mounted at its center on the inner surface of said door, means for supporting for slidable movement in a straight line a first bolt adjacent one edge of said door, means for supporting for slidable movement in a straight line a second bolt adjacent an opposite edge of said door, both of the aforesaid straight lines being aligned with each other so that the aforesaid bolts slide in opposite directions along the same straight line without any rotation with respect to said straight line, connecting means in response to the rotation of said lever arm in one direction to cause said bolts to slide away from each other, and in response to the rotation of said lever arm in the opposite direction to cause said bolts to move toward each other, lock means on the outside of said door passing through said door and connected to said lever arm to permit the use of a key to rotate said lever arm, knob means on the inside of said door connected to said lever arm through pin and cylinder means to permit the rotation of said lever arm by said knob means without causing movement within said lock means to permit rotation of said lever arm to open said door when said lock is in the locked position without disengaging said knob means from said lock, and retainer means mounted on said frame to lock said door when said lever arm is rotated in said one direction causing said bolts to engage said retainer means and to unlock said door when said lever arm is rotated in the opposite direction causing said bolts to become disengaged from said retainer means, said connecting means comprising a first floating link connected pivotally at one end to said first bolt and pivotally at the other end to one end of said lever arm and a second floating link connected pivotally at one end to said second bolt and pivotally at the other end to the other end of said lever arm, and spring means to bias said first and second floating links in both the locking and unlocking positions of said bolts, said spring means comprising a spring for each of said floating links, one end of each spring connected to a floating link, and the other end of each spring connected to said door.



5,010,748
STUD OR BOLT LOCKING DEVICE
Jay S. Derman, 4141 Dixie Canyon Ave., Los Angeles, Calif. 91423
Filed Jul. 23, 1990, Ser. No. 555,854
Int. Cl.[5] F16B *41/00*
U.S. Cl. 70—164 7 Claims

1. A locking device for bolts or studs comprising:
a block, having portions adapted for seating a lock, and for seating the head of a bolt or a stud nut which is fastened to a stud;
a cover member, sized and shaped to cover said block portion which seats the head of a bolt or stud nut; said cover member having a cylindrical shape with a flat edge formed on approximately one quarter of its circumference; said cover member having a cup-shaped recess



formed in its bottom surface, large enough to accomodate the head of a bolt or stud nut; and
a lock, sized and shaped to be seated in said block portion and having a threaded member for securing to said block, so that said lock will bear against the flat edge and part of the top of said cover member, preventing removal of said cover member and thereby preventing access to said head of bolt or stud nut.

LOCK CYLINDER WITH ELECTROMAGNETIC TUMBLER
Werner Böser, Zulpich; Giselher Sieg, Erftstadt, and Robert Wedekind, Erftstadt-Erp, all of Fed. Rep. of Germany, assignors to Dom-Sicherheitstechnik GmbH & Co. KG, Fed. Rep. of Germany
Filed Jan. 31, 1990, Ser. No. 473,009
Claims priority, application Fed. Rep. of Germany, Feb. 2, 1989, 3902992
Int. Cl.[5] E05B *47/06*
U.S. Cl. 70—276 15 Claims

1. A lock cylinder suitable for mortise locks with mechanically operating tumbler pins controlled by a key and at least one electromagnetic tumbler which is arranged in a cylinder casing and comprises a coil as well as a locking member which can be displaced by electromagnetic forces for an additional tumbler pin which is in addition to the key-controlled operating tumbler pins and which is spring-loaded in a locking direction and with an electronic evaluator which is responsive to a key code, wherein said locking member is pivotally mounted in a recess in said additional tumbler pins and enters a locking position in front of a stop on said cylinder casing.

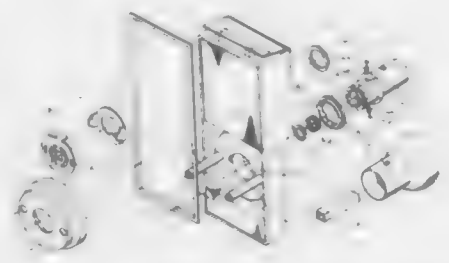
SAFE DEVICE AND MECHANISM FOR OPERATING THE SAME
Moshe Schwartz, and Noam Avni, both of Kibutz Hatzor, Israel, assignors to Omen Metal Products, Israel
Filed Jan. 31, 1989, Ser. No. 304,944
Claims priority, application Israel, Feb. 3, 1988, 85307; Dec. 2, 1988, 88567
Int. Cl.[5] E05B *47/06*
U.S. Cl. 70—276 10 Claims

1. A magnetic card-operated safe comprising:



a body with a structural element;
a door;
a locking mechanism for locking said door;
a support fixed to said structural element with a base plate, on which the locking mechanism is mounted and which is slidably mounted on said structural element for limited rectilinear displacement between a forward and a rear position of the locking mechanism, an eccentric rotatably mounted on said support and engaging an opening in said base plate, whereby rotation of said eccentric will cause said rectilinear displacement of said base plate, said eccentric being so mounted that it may freely rotate whereby to displace said base plate from the rear to the forward position;
a source of power including a battery;
an electric motor for operating said locking mechanism,
a magnetic card reader for reading data stored in the magnetic card used for operating the safe;
permanent memory means for permanently storing information;
volatile memory menas for storing data as long, and only as long, as electric tension is applied thereto;
means for transferring the data read by the magnetic card reader from said magnetic card to a segment of said volatile memory means when no such data are registered therein and for comparing said read data with the data registered therein, when there are such registered data, and with the information stored in said permanent memory means;
electronic circuit means for operating said motor, said magnetic card reader, said permanent memory means, said volatile memory means and said data transferring and comparing means;
switch means, operable when said safe door is open to selectively connect and disconnect said power source to said electronic circuit means;
means for changing the power drawn from said power source, when it is so operatively connected to said electronic circuit means, between at least one high level sufficient to actuate said electric motor and at least one low level sufficient to prevent erasure of the data stored in said volatile memory; and
control means for actuating said electric motor to activate said locking mechanism to lock or unlock said safe door, when said magnetic card is read by said magnetic card reader, only if the data read by this latter corresponds to those registered in said volatile memory means or to information stored in said permanent memory means.

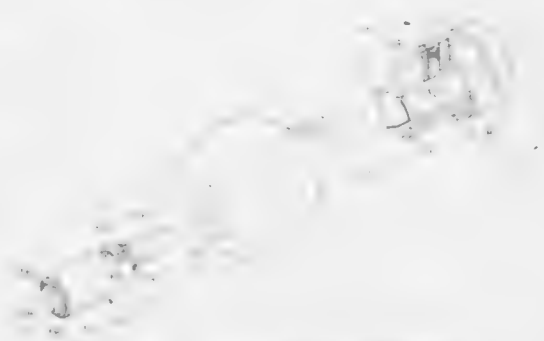
STRUCTURE FOR CONTROLLING THE DEAD BOLT IN AN ELECTRONIC LOCK

Ruey J. Lin, KangShan, Taiwan, assignor to Taiwan Fu Hsing Industry Co., Ltd., KangShan, Taiwan

Filed Jan. 23, 1990, Ser. No. 469,017
Int. Cl.[5] E05B *47/00*
U.S. Cl. 70—277 7 Claims



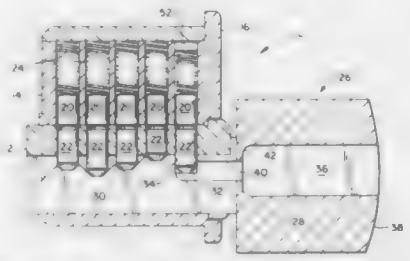
1. A structure for controlling a dead bolt in an electro-magnetic lock comprising:
a control case fixed at the outer side of a door for a coded card to insert in and provided with a shaft hole for a shaft of an outside knob to run through and to rotate therein, said outside knob rotating an inner tube having a square hole for an outside square shaft to fit therein so that the rotation of the outside knob can also rotate the outside square shaft;
a bottom plate combined with an inner case fixed at the inside of the door, said bottom plate and inner case having respectively a corresponding shaft hole for a shaft of an inner knob to fit and rotate therein together, said inner knob combined with an inner tube in its inner hole to rotate together, said inner tube having two opposite slots at an outer end thereof for two opposite projections of a moving ring to engage with, said moving ring having a square shaft hole for an inner square shaft fixed in the moving plate of the dead bolt to fit in, said inner square moving plate of the dead bolt to fit in, said inner square shaft having an inner through hole for a moving rod to pass through to rotate therein idly, said moving rod being longer than the inner square shaft and having both ends extending out of the inner square shaft, one end of said moving rod being square and fitting in the outer square shaft for mutual movement therewith, another end of said moving rod being oval and fixed with a peripherally toothed turning disc confined by a limit plate so as to rotate the limit plate but not to move it lengthwise, said limit plate having a projection to stick in a hole in the inner tube; and
an electro-magnetic coil contained inside the inner tube for producing magnetism to pull a central rod running through the electro-magnetic coil, one end of said central rod linked with a clutch, said clutch provided with a plurality of grooves for engaging with teeth of the turning disc, another end of said central rod being urged by a spring into contact with a disc, said disc provided with tapered grooves for tapered protrusions on a turning button to selectably contact with, said turning button set in the shaft hole of the inside knob and able to be rotated to move the disc so as to push the central rod to make the clutch engage with the turning disc.

5,010,753

INTERCHANGEABLE CORE LOCK

Frederick Boris, Jr., Meriden, Conn., assignor to Lori Corporation, Southington, Conn.

Filed Jul. 6, 1990, Ser. No. 549,409
Int. Cl.[5] E05B *9/04*
U.S. Cl. 70—371 7 Claims



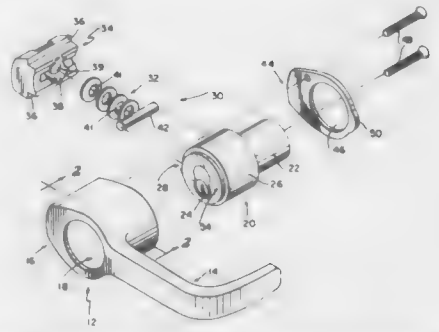
1. A replaceable core lock system comprising:
cylinder lock means, said lock means including shell means and a plug which is rotatable relative to the shell means about an axis, the plug defining a keyway which extends axially thereof, said lock means further including a retainer pin tumbler receiving bore which extends through the shell means and an activating pin tumbler receiving bore which extends between said keyway and the outer circumference of the plug, said retainer and activating pin tumbler receiving bores having axes which are oriented generally transversely with respect to the axis of rotation of the plug, the axes of said retainer and activating pin tumbler receiving bores being non-aligned when the plug is in an unrotated state relative to the shell means, said bores being positioned so as to be capable of being brought into alignment, the shell means further having a non-linear groove which extends from said retainer pin tumbler receiving bore to a first end of the shell means, said shell means first end being disposed oppositely with respect to the key insertion end of the keyway, said plug and shell means cooperating to define a plurality of locking pin tumbler receiving chambers, locking pin tumbler stacks being disposed in said locking pin tumbler receiving chambers and defining the bitting of said lock means;
an activating pin disposed in said activating pin tumbler receiving bore, said activating pin being movable along said bore and being sized to at least in part be received in said retainer pin tumbler receiving bore;
core retainer means, said retainer means including a housing which defines a retainer pin tumbler receiving chamber, said retainer pin tumbler receiving chamber of said housing being axially alignable with said retainer pin tumbler receiving bore in said shell means, said retainer means further including a resiliently biased retainer pin tumbler, said retainer pin tumbler being reciprocal in said housing chamber to normally engage said retainer pin tumbler receiving bore in said shell means to thereby capture said cylinder lock means against motion relative to said housing, insertion into the plug keyway of a control key having a bitting which engages said activating pin transversely repositioning the inwardly disposed end of said retainer pin tumbler to the level of the intersection of said retainer pin tumbler receiving bore in said shell means with said groove whereby said cylinder lock means may be rotated relative to said housing and may be separated therefrom.

5,010,754

LOCK ACTUATOR WITH REMOVABLE OPERATOR

Nelson J. De Angelo, Southington, and Kenneth T. Theriault, Meriden, both of Conn., assignors to Lori Corporation, Southington, Conn.

Filed Jul. 6, 1990, Ser. No. 549,280
Int. Cl.[5] E05B *11/00*
U.S. Cl. 70—[illegible] 20 Claims



1. An actuator for a movable latch member comprising:
lock means, said lock means including a shell and a generally cylindrical plug which is rotatable about an axis relative to said shell, said plug and shell defining a shear line at the interface therebetween and also cooperating to define a plurality of pin tumbler receiving bores which extend across said shear line with said plug in the unrotated state, a pin tumbler comprising at least a resiliently biased driver pin and a bottom pin being disposed in each of said bores, said plug also defining a keyway which intersects said bores whereby the bottom pins of said tumblers may partly extend into said keyway, at least some of said pin tumblers thereby defining the bitting for said lock means, said bitting defining pin tumblers being replaceable whereby the lock means bitting may be changed, at least one of said pin tumblers being a trapping pin tumbler, said one pin tumbler being permanently captured in said lock means;
an operator for said lock means, said operator comprising manually operable handle means and a blade extension, said blade extension projecting from said handle means and having a size and shape generally complementary to said plug defined keyway whereby said blade extension may be received in said keyway, said blade extension being provided with bitting defining surface irregularities which cooperate with the pin tumblers which define the lock bitting to position such pin tumblers such that the shear line between pins thereof lies on the shear line between said plug and shell, said blade extension further being provided with a trapping recess configured to receive the bottom pin of said trapping pin tumbler, a shear line between pins of said trapping pin tumbler being located on the shear line between said lock means plug and shell when said trapping pin tumbler bottom pin is received in said trapping recess, the presence of said operator blade extension in said plug defined keyway permitting relative rotation between said lock means plug and shell by the application of torque to said handle means, the engagement of said trapping pin tumbler bottom pin in said blade extension recess preventing withdrawal of said blade extension from said keyway, said operator further having a slot which extends through said handle means and into said blade extension to intersect said trapping recess; and
an operator release key, said key having a shape which is generally complementary to said slot in said operator and a length which is greater than the depth of said slot, said release key being provided with a camming surface which cooperates with the bottom pin of said trapping pin tumbler to force said trapping pin tumbler bottom pin out of said trapping recess whereby said operator blade extension may be axially withdrawn from said plug keyway be imparting an axial force to said handle means when said release key is inserted in said slot, such withdrawal of said operator blade extension separating said operator from said lock means thereby permitting said pin tumblers to be repositioned whereby pin tumbler comprising pins extend across said shear line between said plug and shell and relative rotation therebetween is prevented.

5,010,755

LOCK WITH TORQUE-RELEASE MEANS

Walter E. Best, Indianapolis, Ind., assignor to Best Lock Corporation, Indianapolis, Ind.

Filed Nov. 20, 1989, Ser. No. 439,238
Int. Cl.[5] E05B *15/16*
U.S. Cl. 70—422 3 Claims

1. A door handle assembly for operating a door-latching system, the door handle assembly comprising
a lock-receiving cylinder for coupling to the door-latching system, the lock-receiving cylinder being formed to include an axially extending groove,
a handle shell surrounding the lock-receiving cylinder, the

handle shell including a lever handle and being formed to include an axially extending elongated chamber,

drive means for yieldably interconnecting the lock-receiving cylinder and the handle shell to establish a normal driving connection so that the lock-receiving cylinder is rotated about an axis of rotation in response to a first torque level applied to the handle shell and is stationary in response to torque levels above the first torque level, the drive means including a rod sized for mounting in the axially extending groove to establish the normal driving connection and spring means for yieldably biasing the rod toward the axially extending groove,

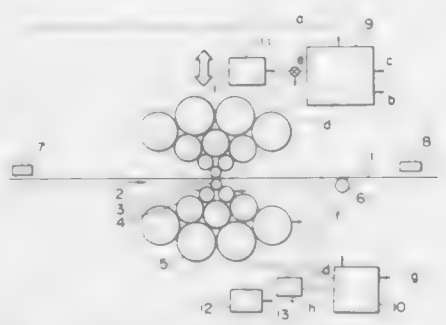
a support block supporting the spring means, the support block being slidably mounted in the elongated chamber and

a retainer for retaining the support block and the drive means within the elongated chamber

---

5,010,756

METHOD OF AND APPARATUS FOR CONTROLLING SHAPE OF ROLLED MATERIAL ON MULTI-HIGH ROLLING MILL



Kazuo Nose; Hiroyuki Yamamoto; Shiro Koike; Masakazu Shimomura, all of Kobe; Hajime Tsubono, Neyagawa; Soichi Kitagawa, Kobe; Yasumasa Fujisaki, Kobe; Yasushi Maeda, Kobe; Tetsuya Wakebe, Kobe, and Yasuyuki Kamiyama, Kobe, all of Japan, assignors to Kabushiki Kaisha Kobe Seiko Sho, Kobe, Japan

Filed Nov. 28, 1989, Ser. No. 442,534

Claims priority, application Japan, Nov. 29, 1988, 63-2[illegible]495; Mar. 3, 1989, 1-49774; Aug. 30, 1989, 1-221803

Int. Cl.[5] B21B *37/02*

U.S. Cl. 72—9 6 Claims

1. A method of controlling the shape of a rolled material on a multi-high rolling mill which includes a strip shape meter for detecting an elongation in a rolling direction of a rolled material on the outgoing side of said multi-high rolling mill as a strip shape, a strip shape controlling actuator for controlling the strip shape of the rolled material, a strip thickness controlling actuator for controlling a strip thickness of the rolled material, a strip shape controlling device for outputting an operation amount to said strip shape controlling actuator to control said strip shape controlling actuator in accordance with a result of detection by said strip shape meter, and a strip thickness controlling device for outputting an operation amount to said strip thickness controlling actuator to control said strip thickness controlling actuator, and wherein the strip shape and the strip thickness of the rolled material are controlled by said strip shape controlling device and said strip thickness controlling device while correcting the operation amount from said strip thickness controlling device taking into consideration a change of the strip thickness which is caused by changing the operation amount of said strip shape controlling actuator said method comprising the steps of:

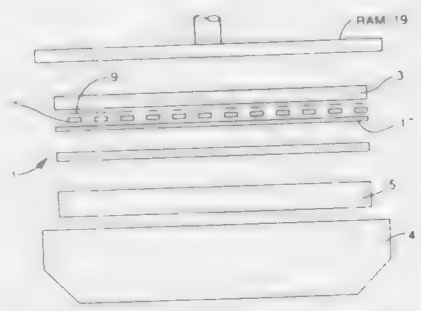
defining and setting in advance a total performance index with which a strip shape and a strip thickness on the outgoing side of the rolled material are to be evaluated using a difference between a preset target strip shape and a strip shape on the outgoing side of said multi-high rolling mill detected by said strip shape meter and a difference between a strip thickness variation caused by a change of the operation amount of each of the actuators and a preset target strip thickness variation upon changing of the operation amount of each of the actuators:

normally detecting, during strip shape control of the rolled material, the strip shape of the rolled material by means of said strip shape meter:

calculating, in accordance with a result of detection from said strip shape meter, operation amounts for said strip shape controlling actuator and said strip thickness controlling actuator which makes the value of the total performance index minimum; and

controlling said strip shape controlling actuator in accordance with an operation amount calculated by said strip shape controlling device and controlling said strip thickness controlling actuator in accordance with an operation amount obtained by adding an operation amount calculated by said strip shape controlling device to an operation amount from said strip thickness controlling device.

5,010,757



METHOD OF FORMING DIMPLES IN A CONDUCTIVE SUBSTRATE

David A. Fishman, Santa Clara, and Jon D. Hone, San Jose, both of Calif., assignors to The United States of America as represented by the Secretary of the Air Force, Washington, D.C.

Filed Jan. 29, 1990, Ser. No. 471,308

Int. Cl.[5] B21D *22/10*

U.S. Cl. 72—60 12 Claims

1. Method of forming shallow fiducial dimples upon a thin flexible electrical circuit comprising a first deflectable substrate having a thickness of about one mil overlaying a second substrate having recesses therein to be aligned with said dimples, said method comprising the steps of:

(a) providing a first support member having highly resilient pads affixed thereto, said pads having a shape corresponding to the shape of said dimples;

(b) providing a second support member;

(c) positioning said flexible electrical circuit between said first and second support members so that said highly resilient pads are aligned with the recesses within said second substrate; and

(d) applying a sufficient opposing force to said first and second members to cause said first substrate to be deflected by said pads by about one mil into said recesses to form said dimples.

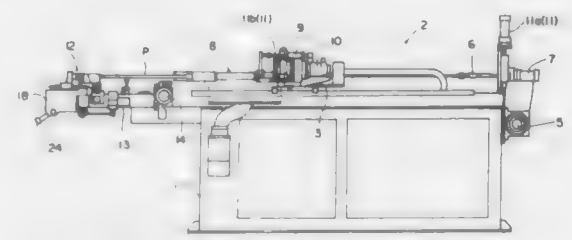
BENDING MACHINE



Hideaki Togoshi, Nishinomiya, Japan, assignor to Chiyoda Kogyo Co., Ltd., Osaka, Japan

Continuation of Ser. No. 267,675, Nov. 3, 1988, abandoned, which is a continuation of Ser. No. 813,337, Dec. 26, 1985, abandoned, which is a continuation-in-part of Ser. No. 761,626, Aug. 1, 1985, abandoned. This application Mar. 12, 1990, Ser. No. 494,892

Claims priority, application Japan, Mar. 23, 19[illegible], 59-42559; Nov. 22, 1985, 60-180475

Int. Cl.[5] B21D *7/04*

U.S. Cl. 72—157 13 Claims

1. In a bending machine comprising

a base block,

a bending assembly, and

means mounted on the base block for holding a length of a workpiece and advancing the workpiece in a first direction to the bending assembly,

the bending assembly comprising means defining a rotational axis, a plurality of rotatable bend dies arranged along said rotational axis and a plurality of clamp dies movable toward and away from the bend dies, the bend dies and the clamp dies being adapted to hold the workpiece therebetween and bend the workpiece by rotating in unison about the rotational axis, the improvement comprising

means for mounting said bending assembly to said base block for movement in a first plane perpendicular to and a first actuator coupled to said base block and means for mounting said bending assembly for moving the bending assembly in said first plane in a second direction transverse of said first direction,

said means for holding and advancing being mounted on the base block to be movable in a third direction parallel to said rotational axis, and further comprising a second actuator, and means coupling said second actuator to said holding and advancing means and base block for moving the holding and advancing means in said third direction whereby a workpiece held by said feed means is moved in said third direction.

5,010,759

WHEEL RIM SHAPING APPARATUS HAVING A SINGLE COTTER SUPPORTABLE AT BOTH ENDS THEREOF

Shojiro Yokomizo, Yokohama; Kouji Izumida, Ayase; Takeshi Saito, Yokohama, and Yutaka Yanamoto, Ayase, all of Japan, assignors to Topy Kogyo Kabushiki Kaisha, Tokyo, Japan

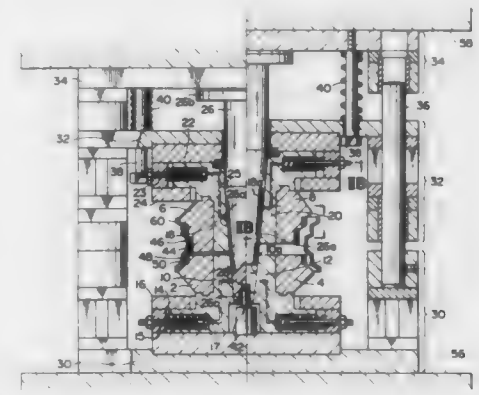
Continuation of Ser. No. 289,303, Dec. 23, 1988, abandoned. This application Jun. 5, 1990, Ser. No. 532,161

Claims priority, application Japan, Dec. 23, 1987, 62-323857

Int. Cl.[5] B21D *53/30*

U.S. Cl. 72—393 11 Claims

1. A wheel rim shaping apparatus to be mounted between a fixed member and a movable member of a press apparatus, comprising:



a first die split into a plurality of first die elements in a circumferential direction of the first die so that the first die can expand and contract in a radial direction of the first die;

a second die provided coaxially with the first die so as to be movable relative to the first die in an axial direction of the first die, the second die being split into a plurality of second die elements in a circumferential direction of the second die so that the second die can expand and contact in a radial direction of the second die;

a first die holder split into a plurality of first die holder elements in a circumferential direction of the first die holder, a first spring means urging each of the first die holder elements in a radially inward direction of the first die holder for constant engagement with said cotter, said first die holder elements engaging the first die so as to expand and contract the first die;

a second die holder split into a plurality of second die holder elements in a circumferential direction of the second die holder, a second spring means urging each of the second die holder elements in a radially inward direction of the second die holder for constant engagement with said cotter, said second die holder elements engaging the second die so as to expand and contract the second die;

a single cotter having a central axis is provided coaxially with the first and second dies and movable in an axial direction of the cotter, the cotter having a bushing with an axially extending and axially open hole having a central axis coaxial with said central axis of the cotter is located in a lower end portion of the cotter, said axially open hole having a continuous circumferential inner surface, the cotter being capable of extending through the second die holder into the first die holder to engage the first and second die holders when the cotter is moved in a direction toward the first die holder supporting member;

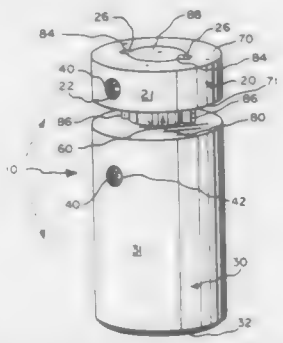
a first die holder supporting member secured to a fixed member of a press apparatus, the first die holder supporting member supporting the first die holder for slidably mounting each of the first die holder elements relative to the first die holder supporting member in the radial direction of the first die holder;

a second die holder supporting member provided on one side of the first die holder supporting member and movable relative to the first die holder supporting member, in an axial direction of the first die holder supporting member, the second die holder supporting member supporting the second die holder for slidably mounting each of the second die holder elements relative to the second die holder supporting member in the radial direction of the second die holder;

a cotter supporting member provided on the same side of the first die holder supporting member as the second die holder supporting member and provided further from the first die holder supporting member than the second die holder supporting member, the cotter supporting member being movable relative to the first die holder supporting member and the second die holder supporting member in the axial direction of the first die holder supporting member, the cotter supporting member being secured to a movable member of the press apparatus, the cotter supporting member securely supporting the cotter at one end portion of the cotter;

oil path means located in said first die holder and in said

second die holder for providing lubricating oil to sliding surfaces between said first die holder and said cotter and between said second die holder and said cotter respectively; and



means for guiding said cotter including a cotter guide fixedly supported so as to be fixed in a position with respect to the first die holder supporting member, the cotter guide having an upwardly extending pin fixed thereto and having a central axis in alignment with said center axis of the cotter, the cotter guide being capable of slidably engaging the cotter at said continuous circumferential inner surface of said axially open hole of the cotter when the cotter is moved in the direction toward the first die holder supporting member.

MULTI-USE FILL HEIGHT TEST DEVICES

Terry E. Nish, and Cecil R. McCray, both of Salt Lake City, Utah, assignors to Servi-Tech, Inc., Salt Lake City, Utah

Filed Apr. 6, 1990, Ser. No. 505,960
Int. Cl.[5] G01B *3/30*
U.S. Cl. 73—1 H **11 Claims**

1. A method of calibrating container filling and closure applying equipment comprising the steps of:

adjustably interrelating a base of free-standing test device and a fill level simulating member thereof;

positioning the fill level simulating member at a predetermined elevation above the base without disruption of the interrelationship between the base and the fill level simulating member;

releasibly securing the fill level simulating member at said predetermined elevation against inadvertent change;

causing the free-standing test device comprising the fill level simulating member so releasibly secured at said predetermined elevation to be displaced through filling and closure applying equipment comprising at least one fill level sensor;

calibrating the at least one fill level sensor to correspond to the fill level simulated by the test device.

5,010,761

AUTOMATED LEAK DETECTION APPARATUS AND METHOD THEREFOR

Bernard Cohen, Woodland Hills; Don B. Caplan, Agua Dulce, and Edward G. Edwards, Woodland Hills, all of Calif., assignors to Superior Industries International, Inc., Van Nuys, Calif.

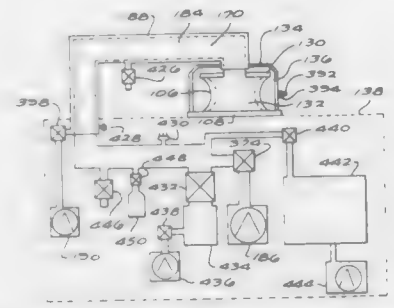
Filed Mar. 1, 1990, Ser. No. 487,596
Int. Cl.[5] G01M *3/20*
U.S. Cl. 73—40.7 **30 Claims**

1. A leak detection system for detecting leaks in an object, the system comprising:

handling means for moving the object;

measurement means for measuring the object; and

sealing means for sealing a part of the object to form a chamber;



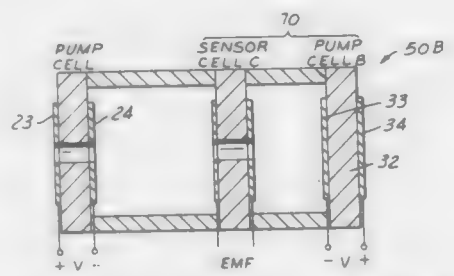
enclosing means for forming an enclosure about the object including the chamber;

first vacuum means for creating a partial vacuum in the chamber;

second vacuum means for providing a partial vacuum to the enclosure such that the partial vacuum of the enclosure is less than the partial vacuum of the chamber;

test gas supply means for introducing a test gas in the outer enclosure, detection means for detecting the amount of test gas in the chamber;

memory means for storing data regarding unacceptable leak rates for a plurality of different objects;



controller means for automatically controlling the handling means to receive the object, move the object to the measurement means, move the object to the detection means, the controller means also for automatically receiving the measurement of the object from the measurement means, for automatically controlling the test gas supply means to introduce test gas into the enclosing means, for automatically receiving the amount of detected test gas from the detection means, for automatically comparing the measurement of the object and the amount of detected test gas to the data in the memory means and for automatically determining whether the object has an unacceptable leak rate based on such comparison.

5,010,762

MEASUREMENT AND CONTROL OF EXHAUST GAS RECIRCULATION WITH AN OXYGEN PUMPING DEVICE

Eleftherios Logothetis, Birmingham, and Richard E. Soltis, Redford, both of Mich., assignors to Ford Motor Company, Dearborn, Mich.

Division of Ser. No. 222,864, Jul. 22, 1988, Pat. No. 4,909,072.
This application Nov. 30, 1989, Ser. No. 443,537
Int. Cl.[5] G01M *15/00*
U.S. Cl. 73—116 **11 Claims**

9. An electrochemical device for measuring the percentage of exhaust gas recirculation (EGR) in an intake air and exhaust gas mixture of an internal combustion engine, said electrochemical device including:

a first solid electrochemical pump cell having a first pair of opposed electrodes;

a second solid electrochemical pump cell having a second pair of opposed electrodes;

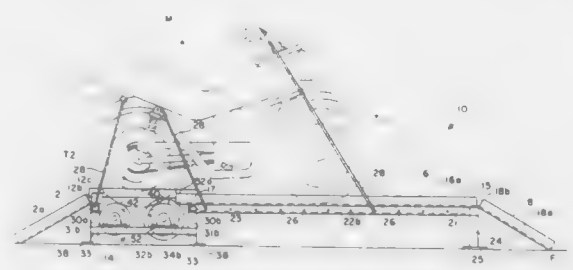
a supporting structure coupled to said first and second pump cells to form with them a restricted volume;

an aperture for providing communication between said restricted volume and an ambient of said intake air and exhaust gas mixture;

a first external circuit means coupled to said first pump cell for passing a constant current through said first pump cell so that of said first pair of opposed electrodes a first pump cell electrode inside said volume is biased negatively causing a portion of the oxygen molecules inside said volume to be pumped out by said current flowing through said first pump cell;

a second external circuit means coupled to said second pump cell for applying a constant voltage across said second pump cell so that of said second pair of opposed electrodes a second pump cell electrode inside said volume is biased negatively, said constant voltage across said second pump cell being sufficient to cause substantially all of the remainder of the oxygen molecules inside said volume to be pumped out by a current flowing through said second pump cell but less than that capable of disassociating CO_2 or H_2O molecules;

a third external circuit means coupled to said second pump cell for measuring said current flowing through said second pump cell, said second pump cell current being proportional to the percentage of O_2 molecules inside said volume not pumped out by said first pump cell and also proportional to the percentage of O_2 molecules in the intake air and exhaust gas mixture; and



means defining a diffusion barrier between said first pump cell and said second pump cell.

5,010,763

ROAD SIMULATION DEVICE

William J. Schneider, Rte. 1, Box 339, E. Bernstadt, Ky. 40729

Filed Jan. 24, 1990, Ser. No. 469,333
Int. Cl.[5] G01M *15/00*
U.S. Cl. 73—117 **17 Claims**

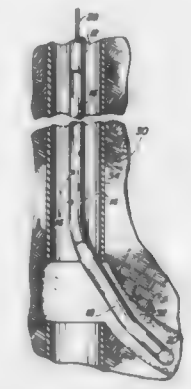
1. A road simulation device for qualitative testing or demonstration of a motorcycle, the device comprising:

(a) a motorcycle support frame including entrance means, exit means, a rigid, immovable one-piece longitudinal motorcycle support means extending substantially horizontally between said entrance means and said exit means, having a length at least as long as a motorcycle to be tested or demonstrated thereon and having opposing ends one of said opposing ends fixed substantially adjacent to said exit means, and vertical support means for positioning said longitudinal motorcycle support means spacedly upward from a floor at the exit end of said longitudinal motorcycle support means;

(b) a housing disposed between said entrance means and said longitudinal motorcycle support means;

(c) a rotation assembly located within said housing and including a first roller and a second roller positioned side-by-side, horizontally parallel to each other and perpendicular to the longitudinal axis of the motorcycle support means for rotatably supporting and for forcible rotation by the rear tire of a motorcycle positioned upright upon said device;

(d) drag applying means connected to said first roller; and



(e) means for controlling said drag applying means attached thereto; whereby to simulate the effect of a road to permit qualitative testing or demonstration of the operation of a motorcycle secured upon said road simulation device without the necessity of placing a driver on the motorcycle and taking the motorcycle onto a road.

5,010,764

METHOD AND APPARATUS FOR LOGGING SHORT RADIUS HORIZONTAL DRAINHOLES

David E. Taylor, Lafayette, La., assignor to Marathon Oil Company, Findlay, Ohio

Filed Nov. 1, 1989, Ser. No. 432,103
Int. Cl.[5] E21B *47/00*
U.S. Cl. 73—151 **9 Claims**

1. Apparatus for use in logging a short radius horizontal drainhole, comprising:

a tubing string having a lower portion;

the lower portion of the tubing string including sensor support means therein;

the lower portion of the tubing string containing openings communicating with the interior thereof in the vicinity of the sensor support means to thereby expose the interior to the pressure and temperature conditions of the horizontal drainhole; and

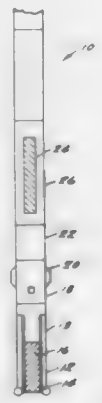
the lower portion of the tubing string including an end portion extending transversely of the tubing string.

5,010,765

METHOD OF MONITORING CORE SAMPLING DURING BOREHOLE DRILLING

Allen Duckworth, Middlefield; Derek Barnes, Wallingford, both of Conn., and Thomas L. Gennings, Anchorage, Ak., assignors to Teleco Oilfield Services Inc., Meriden, Conn.

Filed Aug. 25, 1989, Ser. No. 398,668
Int. Cl.[5] E21B *49/00*
U.S. Cl. 73—153 **6 Claims**



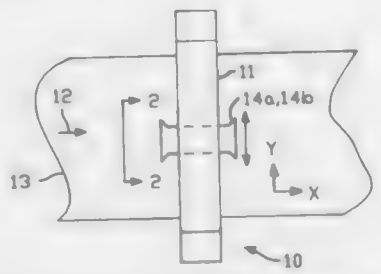
1. A method of monitoring the acquisition of a core sample obtained from a coring tool on a drillstring in a borehole, comprising the steps of:

measuring the weight of a portion of the drillstring at a pre-selected borehole depth when the drillstring is off bottom to define a first measurement;

drilling to acquire a core sample; measuring the weight of a portion of the drillstring at a pre-selected borehole depth when the drillstring is off-bottom to define a second measurement;

determining the difference between the first and second

measurements, the difference corresponding to the weight of the core sample; and



comparing the measured core sample weight to a calculated weight of a full core sample to determine if the core sample has been acquired.

5,010,766

ERROR COMPENSATION FOR MEASURING GAUGES

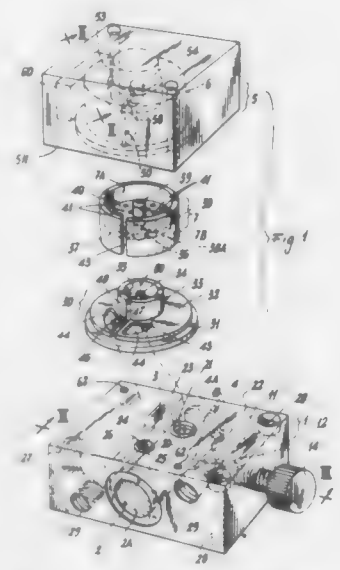
Pekka M. Typpo, Cupertino, Calif., assignor to Impact Systems, Inc., San Jose, Calif.

Filed Nov. 30, 1989, Ser. No. 443,926
Int. Cl.[5] G01B *7/14;* **G01N** *27/72*
U.S. Cl. 73—159 **9 Claims**

1. Apparatus for error compensating a measured characteristic of a moving sheet material, including a pair of transducers for measuring said characteristic spaced opposite each other with the sheet therebetween and mounted on opposite scanning heads to traverse across the direction of movement of the moving sheet, the transducers along with said scanning heads being subject to mechanical displacement error in both a lateral relationship (X,Y) parallel to the plane of the moving sheet and in a vertical direction perpendicular to the sheet where the spacing Z between the heads may change, said error compensating apparatus comprising:

metal target means mounted on said one scanning head,

means mounted on said other scanning head opposite said target means for measuring at least said X, Y displacement error, including two pairs of eddy current sensors mounted with one scanning head, each of said sensors generating an output signal related to its distance from a portion of said target opposite such sensor, an eddy current being induced in said target portion by said sensor, the combined said signals of one said pair of sensors indicating X displacement error and said other pair Y displacement error;



process means responsive to said X, Y displacement errors for correcting said measured characteristic.

MODULAR DEVICE FOR MEASURING THE VOLUMETRIC FLOW RATE OF A LIQUID, PARTICULARLY A LUBRICANT FLUID, IN A HYDRAULIC CIRCUIT

Gualtiero Divisi, Milan, Italy, assignor to Dropsa S.p.A., Italy

Filed Oct. 26, 1989, Ser. No. 427,742
Claims priority, application Italy, Nov. 25, 1988, 22751 A/88
Int. Cl.[5] G01F *3/08*
U.S. Cl. 73—253 **17 Claims**

1. A device for measuring the volumetric flow rate of a fluid, in particular a lubricant fluid in a hydraulic circuit, said device comprising:

(a) a circular rotor rotating eccentrically in a circular chamber under the action of pressurized fluid which enters and leaves at different points of said chamber;

(b) a fixed sensor located close to a point within said circular chamber, the cyclic rotation of said rotor causing it to approach said point so that the sensor generates a signal;

a distributor block provided with an entry bore and an exit bore;

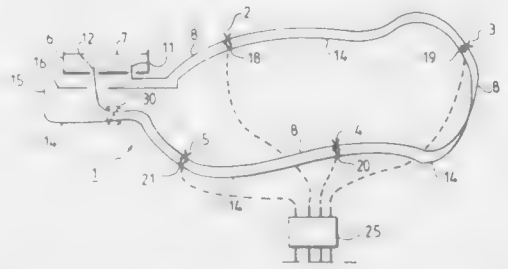
a measurement block;

a feed duct and a return duct within sadi distribution block to and from said measurement block, said measurement block removably suppported by the distributor block;

said distributor block being provided with means for adjusting the fluid flow to the measurement block;

said sensor, the circular chamber and the rotor being located in said measurement block;

wherein said means for adjusting said fluid flow to the measuring block is a needle valve;



wherein the distributor block comprises a channel which opens into said entry bore, a duct connected to said channel and a chamber connected to said duct in which said means for adjusting said fluid flow to the measurement block comprising said needle valve are located, and comprising said feed duct extending from said chamber and opening into a port in that surface on which said measurement block rests on said distributor block, and said surface having a further port said distributor block having said return duct connecting with said further port and terminating in the exit bore such that said feed duct and said return duct respectively feed fluid from said distributor block to said measurement block and return fluid from said measurement block to said distributor block and said measurement block measures the volumetric flow rate of fluid flowing through said channel.

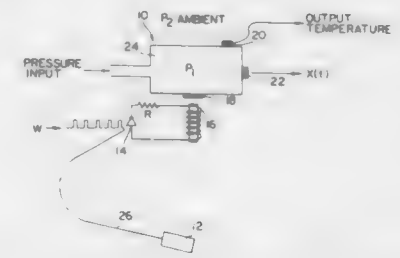
AUTOMATIC PSEUDOKEYPHASOR GENERATOR

Ian J. King, Winter Springs, and Michael P. Chow, Orlando, both of Fla., assignors to Westinghouse Electric Corp., Pittsburgh, Pa.

Filed Jan. 31, 1990, Ser. No. 473,004
Int. Cl.[5] G01N *29/00*
U.S. Cl. 73—660 **7 Claims**

1. In apparatus for analyzing the vibratory behavior of a rotating machine in response to signals representing vibrations occurring in the machine, which apparatus includes: a controllable signal generator connected to receive an input signal representing the rate of rotation of the machine and to produce an output signal representing a rate of rotation bearing a selected relation to the rate of rotation represented by the input signal, the generator being responsive to digital signals which set the value of the selected relation; and a signal analyzing device connected to receive the signals representing vibrations and the output signal from the signal generator for processing the signals representing vibrations as a function of the machine rotation rate represented by the output signal from the signal generator, the improvement comprising:

digital signal supply means providing first digital signals representing the value of the selected relation; and



electrically controlled signal generating means connected between said digital signal supply means and said controllable signal generator for supplying to said controllable signal generator second digital signals which correspond to the first digital signals and which act to set the value of the selected relation.

VIBRATING TUBE FIBER OPTIC PRESSURE TRANSDUCER WITH LIGHT-POWERED ELECTRO-MAGNETIC DRIVE

John W. Berthold, Salem, Ohio, assignor to The Babcock & Wilcox Company, New Orleans, La.

Filed Sep. 20, 1989, Ser. No. 409,849
Int. Cl.[5] G01L *11/00*
U.S. Cl. 73—702 **11 Claims**

1. A fiber optic transducer for measuring the pressure within a vessel, comprising:

means for producing a first series of light pulses;

means for converting said first series of light pulses into magnetic pulses;

optical fiber means for transmitting said first series of light pulses from said light pulse producing means to said converting means;

magnetic means operatively connected to the vessel whose pressure is being measured for converting said magnetic pulses applied thereto into periodic mechanical vibration of the vessel;

means for producing a secondary light signal, said secondary light signal being directed toward and reflected from a reflective means attached to the vessel producing a modulated reflected secondary light signal proportional to said periodic mechanical vibration of the vessel, said producing means providing a reference light signal for producing a reflected reference light signal with a difference in phase between said reflected secondary light signal and the reflected reference light signal; and

means for measuring said modulated reflected secondary light signal for determining the pressure within the vessel.

PRESSURE MAPPING SYSTEM WITH CAPACITIVE MEASURING PAD

Joe D. Bourland; Charles F. Barbs; Leslie A. Geddes; Willis A. Tacker, Jr., and George P. Graber, all of W. Lafayette, Ind., assignors to Purdue Research Foundation, West Lafayette, Ind.

Continuation-in-part of Ser. No. 850,518, Apr. 11, 1986, Pat. No. 4,827,763. This application May 5, 1989, Ser. No. 347,921

Int. Cl.[5] A61B *5/10*; **G01L** *5/00, 1/14*

U.S. Cl. 73—862.04 **21 Claims**

18. A system for monitoring the distribution of forces on a surface, comprising:

a pad having first and second arrays of electrodes and insulating material disposed between said first and second arrays to form a matrix of capacitive nodes each of which has a capacitance that varies in accordance with the degree of pressure on the pad at the location of the node;

means for scanning the electrodes of said first and second arrays to thereby successively address nodes in said matrix,

means for measuring the capacitance of an addressed node by sensing current of a scanned electrode of said second array; and

means for connecting each electrode of said second array to a reference potential for the driving signal to thereby render all electrodes of said second array at substantially zero volts to thereby isolate the measured capacitance from the effects of changes in capacitance of nodes other than the addressed node whose capacitance is being measured

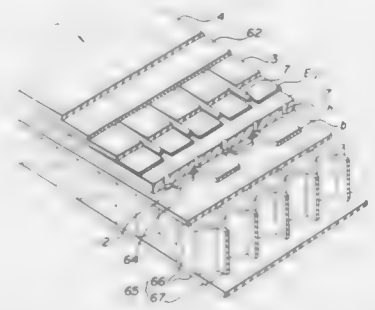
DISTRIBUTION TYPE TACTILE SENSOR

Kanaya Kikuo; Katsuhiko Kanamori, both of Hiratsuka, and Ryosuke Masuda, Fujisawa, all of Japan, assignors to The Yokohama Rubber Co., Ltd., Tokyo, Japan



PCT No. PCT/JP88/01122, § 371 Date Jun. 3, 1989, § 102(e) Date Jun. 3, 1989

PCT Filed Nov. 4, 1988, Ser. No. 381,710

Claims priority, application Japan, Nov. 5, 1987, 62-278348; Jan. 19, 1988, 63-7419

Int. Cl.[5] G01L *5/00, 1/20*; **H01C** *10/10*; **B25J** *19/02*

U.S. Cl. 73—862.04 **8 Claims**

1. A distribution type tactile sensor comprising:

a plurality of electrodes provided in pairs at respective pressure sensing points on a pressure sensitive conductive rubber sheet capable of changing the electrical resistance responsive to compressive forces; and

rectifier means provided to respective electrodes for rectifying the current flowing across each pair of electrodes through the rubber sheet, the electrodes being divided into groups each comprising electrodes arranged in a line corresponding to respective polarities of the electrodes, wherein electrodes in respective electrode groups are parallel connected to one another through electrode leads, and directions of a division of electrode groups divided into respective polarities are crossed with one another at respective pressure sensing points;

wherein belts of the pressure sensitive conductive rubber sheet are disposed in a mutually parallel and spaced arrangement on pairs of electrodes provided on a sensor board in a chessboard arrangement, a cover having a relatively low friction resistance and comprising a flexible material is applied to the surfaces of the belts of the rubber sheet, and a flexible surface-forming member is further applied on the cover thereby providing a laminate structure; and wherein the peripheral edge of the laminate structure is fixed and electrodes having respective polarities are divided into respective groups in a mutually perpendicular arrangement.

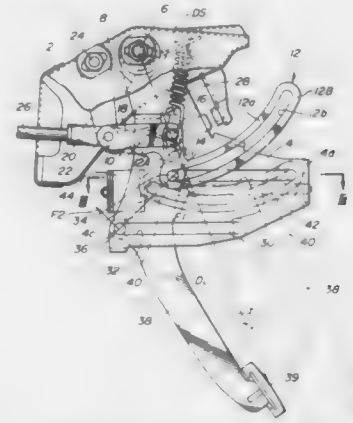
POSITION ADJUSTABLE PEDAL ASSEMBLY



Yasushi Asano, and Yoshimasa Kataumi, both of Shizuoka, Japan, assignors to Fuji Kiko Company, Ltd., Tokyo, Japan

Filed Jul. 28, 1989, Ser. No. 386,401

Claims priority, application Japan, Jul. 28, 1988, 63-188774; Jul. 28, 1988, 63-188775; Jul. 28, 1988, 63-188776; Jul. 28, 1988, 63-188777

Int. Cl.[5] G05G *1/14*

U.S. Cl. 74—512 **12 Claims**

1. A position adjustable pedal assembly for a vehicle comprising:

a stationary bracket fixed to a stationary portion of the vehicle;

a lever connected to said stationary bracket for a pivotal movement relative to said stationary bracket about a first pivot axis;

a pedal arm with a pedal pad at its lower end, said pedal arm connected to said lever for pivotal movement with said lever as one integral unit in response to a depression force applied to the pedal pad;

pedal position adjusting means including a drive member and a driven member, said drive member adapted to be activated by a vehicle driver's operation, said driven member mounted on said pedal arm to be selectively driven by said drive member to move in a longitudinal direction of the vehicle along with said pedal arm relative to said lever so as to adjust a position of the pedal pad in the longitudinal direction of the vehicle;

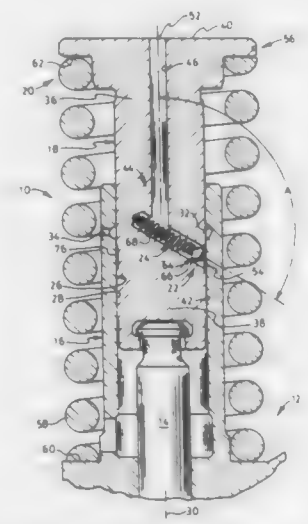
an adjust lever provided on said lever, said adjust lever being allowed a relative movement to said lever and having a connecting member which is adapted to move within a first arc-shaped track in response to the relative movement of said adjust lever;

a second arc-shaped track formed on said adjust lever;

a first linear track formed on said lever and extending in the longitudinal direction of the vehicle;

a first guide member provided on said pedal arm, said first guide member adapted to move within said first linear track, and simultaneously within said second arc-shaped track formed on said adjust lever when said pedal arm is driven to move in the longitudinal direction of the vehicle via said pedal position adjusting means, said movement of the first guide member changing a distance from said first

pivot axis to said pedal pad corresponding to a magnitude of the movement of said first guide member and simultaneously allowing said relative movement of the adjust lever to change a position of said connecting member within said first arc-shaped track corresponding to said magnitude of the movement of said first guide member; and



operating member means connected to said connecting member for receiving therefrom the depression force applied to said pedal pad via said pedal arm and said lever and for transmitting said depression force to a vehicle operation system to operate same.

1. A hydraulic control system for an automatic transmission of a vehicle, the automatic transmission comprising a plurality of engaging means including low speed engaging means for achieving a relatively low gear ratio and high speed engaging means for achieving a relatively high gear ratio, said hydraulic control system comprising:

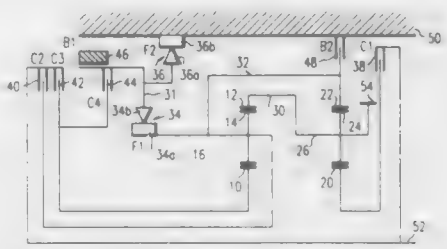
pump means for generating a hydraulic pressure;

selector means having a plurality of positions selectable through manual operation, for supplying the hydraulic pressure generated by said pump means to an engaging means selected from among said plurality of engaging means when one of said plurality of positions is selected;

a plurality of electromagnetic valve means as many as said plurality of engaging means, each arranged between a corresponding one of said engaging means and said selector means, for controlling the intensity of the hydraulic pressure supplied from said selector means to said corresponding engaging means in accordance with operating conditions of the vehicle;

signal hydraulic pressure supplying means for generating a signal hydraulic pressure;

pressure regulating valve means arranged between said selector means and said pump means, for reducing the hydraulic pressure supplied from said pump means to said selector means when said signal hydraulic pressure is supplied from said signal hydraulic pressure supplying means; and



switching valve means movable between a supply position in which said signal hydraulic pressure is supplied from said signal hydraulic pressure supplying means to said pressure regulating valve means, and a discharge position in which said signal hydraulic pressure is discharged from said pressure regulating valve means, said switching valve means being switched to said supply position when the hydraulic pressure supplied to said high speed engaging means through said electromagnetic valve means associated with said high speed engaging means becomes higher than a predetermined value.

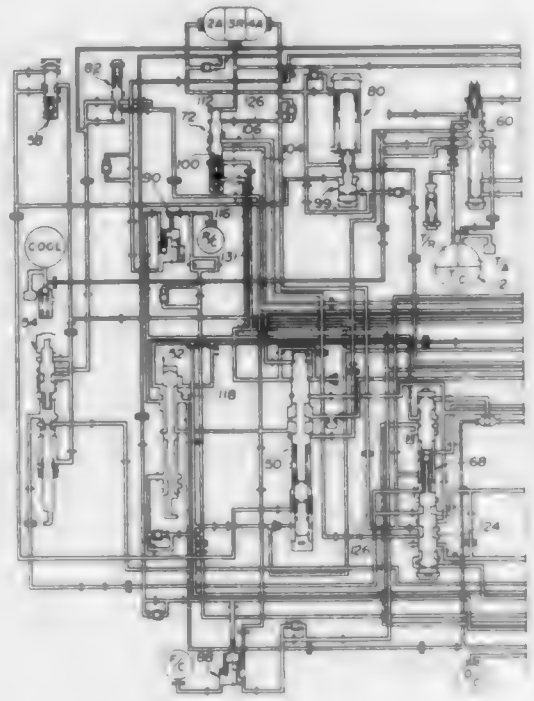
HYDRAULIC CONTROL DEVICE FOR AUTOMATIC TRANSMISSION FOR VEHICLE ADAPTED TO ENGAGE CLUTCH AT DIFFERENT SPEED ACCORDING TO ENGINE OUTPUT POWER

Mitsuru Takada; Hiroshi Itoh, both of Toyota; Tokuyuki Takahashi, Aichi, and Makoto Funahashi, Toyota, all of Japan, assignors to Toyota Jidosha Kabushiki Kaisha, Toyota, Japan

Filed Aug. 2, 1989, Ser. No. 388,488
Claims priority, application Japan, Aug. 2, 1988, 63-192965; Sep. 12, 1988, 63-228269; Feb. 6, 1989, 1-27243
Int. Cl.[5] B60K *41/16*
U.S. Cl. 74—867 **6 Claims**

1. In an automatic transmission for a vehicle such as an automobile having a speed stage shifting mechanism including parallelly arranged first and second hydraulically operated input clutches and adapted to provide a certain first speed stage in which said first and second input clutches are both engaged and a certain second speed stage higher than said first speed stage in which said first input clutch is disengaged and said second input clutch is engaged, the engagement of said first input clutch in said first speed stage being not essential unless engine brake availability is required,



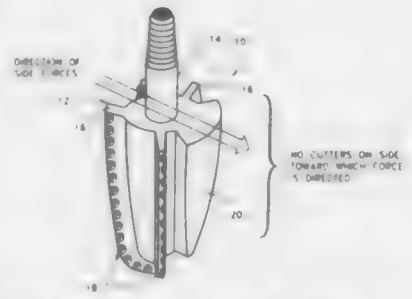
a hydraulic control device comprising a switching over valve variably operable according to an input signal representing engine output power so as to switch over supply of a hydraulic pressure to said first input clutch between a first mode of relatively slowly supplying said hydraulic pressure to said first input clutch and a second mode of relatively quickly supplying said hydraulic pressure to said first input clutch according to whether engine output power is higher than a determinate power level or less than said determinate power level, respectively.

5,010,788

AUTOMATIC AUTOMOTIVE TRANSMISSION HAVING 4-2 DOWNSHIFT SEQUENCE VALVE

Kazuhiko Sugano, Yokohama, and Akihiro Ueki, Zama, both of Japan, assignors to Nissan Motor Co., Ltd., Yokohama, Japan

Filed Apr. 6, 1990, Ser. No. 505,265
Claims priority, application Japan, Apr. 17, 1989, 1-95236
Int. Cl.[5] B60K *41/06*
U.S. Cl. 74—868 **3 Claims**



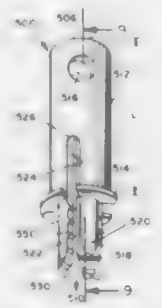
1. In a transmission having:
a first chamber means which is associated with the production of a first predetermined gear ratio,
a second chamber means which is associated with the production of a second predetermined gear ratio which is one gear ratio lower than the first predetermined one, and
a third chamber means for conditioning a first friction element to assume a condition wherein the transmission can produce engine braking, when supplied with hydraulic pressure; an arrangement comprising:
a friction element control valve for supplying hydraulic pressure to said third chamber means in response to a hydraulic pressure signal which is produced by a manual valve when said manual valve is set in a first predetermined position; and
a sequence valve which, in the absence of the hydraulic pressure signal, enables a shift which skips over a gear intermediate of the gear from which the shift is being made, and the gear to which is being made, said sequence valve being responsive, in the absence of the hydraulic pressure signal, to the pressure which is supplied to the second chamber means associated with the intermediate gear and arranged such that, when the pressure which is supplied to the second chamber means is below a predetermined level, said sequence valve shifts from a first state wherein pressure is supplied to said first chamber means, to a second state wherein the pressure which is supplied to the first chamber means is drained, said sequence valve being responsive to the presence of said hydraulic pressure signal to shift from the first state to the second state irrespective of the pressure being supplied to the second chamber means.

5,010,789

METHOD OF MAKING IMBALANCED COMPENSATED DRILL BIT

J. Ford Brett, Tulsa, and Tommy M. Warren, Coweta, both of Okla., assignors to Amoco Corporation, Chicago, Ill.

Division of Ser. No. 313,126, Feb. 21, 1989, abandoned. This application Oct. 6, 1989, Ser. No. 418,416
The portion of the term of this patent subsequent to Mar. 28, 2006, has been disclaimed.
Int. Cl.[5] B21K *5/02*
U.S. Cl. 76—108.2 **10 Claims**



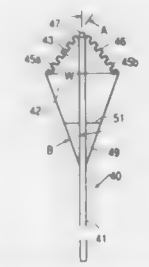
1. A method for making a drill bit of the type having a bearing zone on a side portion of a bit body and a cutting zone with a plurality of cutters mounted on the bit body, comprising the steps of:
mounting a preselected number of cutters within the cutting zone on the bit body;
generating a model of the geometry of the bit body and cutters mounted thereon;
calculating the imbalance force which would occur in said bit body under defined drilling parameters;
using the imbalance force and model to calculate the position of at least one additional cutter which when mounted within the cutting zone on the bit body in said calculated position would create a net imbalance force directed towards the bearing zone; and
mounting an additional cutter within the cutting zone on said bit body in the position so calculated.

5,010,790

APPARATUS FOR REMOVING A SOFT STOPPER FROM A CONTAINER

Richard C. K. Yen, 1440 E. Comstock Ave., Glendora, Calif. 91740

Continuation-in-part of Ser. No. 401,186, Aug. 31, 1989, Pat. No. 4,916,985. This application Mar. 29, 1990, Ser. No. 500,991
Int. Cl.[5] B67B *7/02*
U.S. Cl. 81—3.45 **37 Claims**



1. An apparatus for removing a soft stopper from a container, comprising:
a. an elongated thin walled hollow generally cylindrical body having a lower end which is open and extends into an interior chamber within the body which interior chamber is bounded by an interior wall of the body;
b. A multiplicity of spaced apart longitudinal slits in the wall of said elongated thin walled hollow generally cylindrical body extending from the lower open end for a portion of the length of the elongated body to divide the lower portion of the wall of the elongated thin walled hollow generally cylindrical body into a multiplicity of wedge sections separated from one another by a respective longitudinal slit;
c. an exterior fixed broken ring extending around the circumference of said thin walled hollow generally cylindrical body at a location along the length of said multiplicity of wedge sections, the breaks in the ring aligned with the longitudinal slits in the wall of the elongated thin walled hollow generally cylindrical body; and
d. at least one inwardly extending spiral thread extending from the interior surface of said thin walled hollow generally cylindrical body and winding from the lower tip of one wedge section across the interior surface of all wedge sections and onto the wall of the cavity within the body above the location of the fixed broken ring.

SHINGLE PRY BAR

James D. Williams, R.F.D 4, Thornwood Rd., Carmel, N.Y. 10512

Filed Jul. 23, 1990, Ser. No. 556,909
Int. Cl.[5] E04D *15/00*
U.S. Cl. 81—45 **16 Claims**

1. Roofing shingle removal tool comprising
a handle (**41**);
a prying blade (**42**) having
an essentially triangular, substantially flat forward portion (**43**) defining an apex region (**47**) and two lateral sides (**45***a*, **45***b*);
nail receiving notches (**44**) formed in said lateral sides and defining teeth (**46**) therebetween, and
a rear support portion (**49**) extending from the forward portion;
first attachment means (**48**) for attaching said forward portion to said handle immediately adjacent the apex region, and for retaining the forward portion with respect to said handle at a first angle (D); and
second attachment means (**50**) for attaching said rear support portion to said handle at a position remote from said first attachment means,
said blade defining a bend or heel (**51**) between said forward portion and said support portion, which bend or heel or ridge line (**51**) is spaced from said handle by a predetermined distance (h).

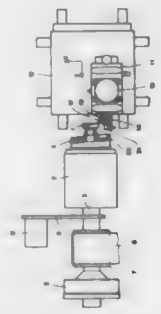
SOCKET WRENCH DRILL ATTACHMENT

Mark L. Clarno, 2649 Garfield St., Longview, Wash. 98632

Filed Jul. 13, 1989, Ser. No. 379,069
Int. Cl.[5] B25B *13/00*
U.S. Cl. 81—58.1 **1 Claim**

1. A ratchet wrench, comprising a housing having a manually rotatable housing having a rotation axis; an elongated handle extending from said housing away from the rotation axis; a gear mounted within said housing for rotation on said axis; a manually-operated ratchet mechanism mounted within said housing in operative engagement with said gear for causing the gear to have one way rotary motion; a square cross-sectioned stub shaft extending from one face of said gear out of said housing on the rotation axis, said square cross-sectioned shaft having four straight flat sides thereon adapted to mate with a wrench socket; and a triangular cross-sectioned stub shaft extending from the other face of said gear out of said housing on the rotation axis, said triangular cross-sectioned shaft having three straight flat sides thereon adapted to fit into the chuck of a power drill whereby said gear can be power driven while the human operator grasps said handle to hold the housing motionless; said manually-operated ratchet mechanism including a carrier (**32**) rotatably mounted within the housing



for rotation on a second axis parallel to the gear rotation axis, an external manual lever (**38**) connected to said carrier for rotating said carrier to two different positions, and a resilient means (**34**) mounted on said carrier, said resilient means having two oppositely-projecting ends adapted to selectively engage said gear, whereby one end of the resilient means has ratchet engagement with the gear in one position of the carrier, and the other end of the resilient means has ratchet engagement with the gear in a different position of the carrier; said lever being operable to adjust the position of the carrier to change the direction of rotation of said gear; said triangular cross-sectioned shaft having a greater axial length than the square cross-sectioned shaft; said triangular cross-sectioned shaft having a lesser diameter than the square cross-sectioned shaft.

MACHINING APPARATUS FOR PRECISE TURNING OF AN OUTSIDE SURFACE

Hans J. Leiber, Tramelan, Switzerland, assignor to Kummer Freres SA Fabrique de machines, Tramelan, Switzerland

Filed May 2, 1989, Ser. No. 346,464
Claims priority, application Switzerland, May 10, 1988, 1780/88
Int. Cl.[5] B23B *3/28*
U.S. Cl. 82—19 **6 Claims**

1. An auxiliary apparatus for the precision turning of a lateral surface of a workpiece fixed by chucking means in a spindle of a machine having a cross-slide, said apparatus comprising:
a base fixed on said cross-slide;
a guided slide movable in a predetermined direction relative to said base;

means integral with said guided slide for holding a plurality of turning tools,

spring means disposed in said base for urging said guided slide in said predetermined direction,

a cam control device including a plurality of cams driven rotatingly synchronously with said spindle, each cam having a guide surface for effecting controlled displacements of said guided slide, each of said tools thus machining a respective portion of said lateral surface,

means for driving all of said cams synchronously; and

a plurality of transmission members mounted on said guided slide, each co-operating with a corresponding one of said cams,

said cams and said transmission members being arranged so that each of said transmission members can be brought successively by displacement of said cross-slide into a bearing position in which each said transmission member rests against said guide surface of the corresponding cam against the action of said spring means for controlling displacement of said guided slide

HYDROSTATIC SPINDLE DEVICE

Earl E. Klager, 8220 Klager Rd., Saline, Mich. 48176

Filed Feb. 5, 1990, Ser. No. 459,183

Int. Cl.[5] B23B *19/02*

U.S. Cl. 82—147 **1 Claim**

1. A hydrostatic spindle device for the purpose of driving a cutting tool or workpiece comprising:

a spindle rotably and translatably supported by hydrostatic radial bearings;

hydrostatic radial bearing mounted on each end of a housing through which the spindle extends, one end to which a hydraulic motor for rotating the spindle is attached, and the opposite end to hold a cutting tool or workpiece;

a piston formed integral with the spindle, operating within a cylinder, in the area between the hydrostatic radial bearings to control translational position, velocity, and acceleration of the spindle, as hydraulic fluid is controllably introduced into the cylinder;

a hydrostatic thrust bearing at each end of the cylinder to create an opposing force on the piston as it nears the end of its stroke, actuated by the piston substantially restricting a hydraulic fluid exit port as hydraulic fluid is introduced to the exit port end of the cylinder via an inlet port interconnected through a restrictor and inwardly allowing check valve to pressurized hydraulic fluid on the opposite side the piston, interchanging hydraulic fluid inlet and exit ports through external hydraulic fluid flow control devices moves the piston to unrestrict the previously restricted port, and closes the check valve to prevent hydraulic fluid escape from the pressurized side of the piston, said hydrostatic thrust bearings being effective to prevent wear arising from action of rotating piston forced unopposed against the cylinder end.

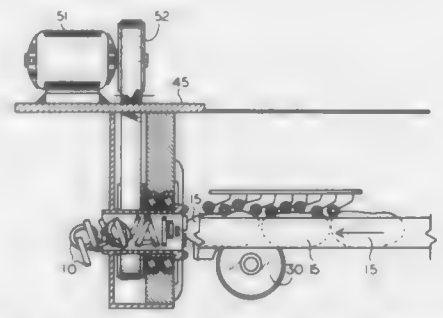
HELICAL SPLIT RING FRENCH FRY AND APPARATUS FOR MAKING THE SAME

George A. Mendenhall, 4252 S. Eagleson Rd., Boise, Id. 83705

Filed Jan. 31, 1990, Ser. No. 472,714

Int. Cl.[5] B26D *3/11, 7/06*

U.S. Cl. 83—865 **9 Claims**



1. A cut food piece formed in the shape of a helical split ring

cut from a whole food product having a longitudinal axis by use of the process of:

cutting a slot in the whole food product which is aligned with and radially extends into and along the longitudinal axis of said whole food product;

aligning the longitudinal axis of the whole food product coincident to a central axis of a cutter blade assembly;

moving the aligned and slotted whole food product into cutting engagement with a cutter blade assembly having a wheel plate having a planar surface for rotation about a

central axis, a plurality of ring cutters attached to and extending normally out from the planar surface of the wheel plate for cutting continuous concentric helical spirals in the whole food product, a sheer blade attached to and extending angularly out from the planar surface for cutting concentric helical rings of cut food product off the whole food product, and said wheel plate further having a transport hole positioned adjacent to the sheer blade for passage of sheered concentric helical split rings of cut food product through the cutter blade assembly.

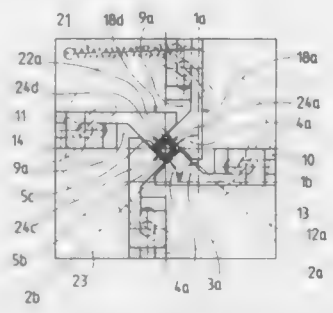
ARRANGEMENT FOR CUTTING AND/OR STRIPPING APPARATUSES



Jiri Stepan, St. Gallerstrasse 76, CH-7320 Sargans, Switzerland

Filed Jun. 23, 1988, Ser. No. 210,578

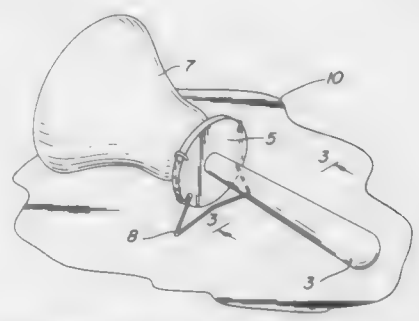
Claims priority, application Switzerland, Jun. 30, 1987, 2494/87

Int. Cl.[5] H02G *1/12*

U.S. Cl. 83—883 **15 Claims**

1. An arrangement of at least three jaws, lying substantially in a common plane, in an apparatus for cutting or stripping sleeve-like insulation from cable-like articles, wherein the jaws have means permitting each jaw to be displaceable under positive control into engagement with such an article with each jaw engaging the article at a certain respective contact point, said contact point depending on the diameter of the article and being different for each respective diameter of the article.

5,010,798



HANDBELL ANTI-ROLL CLIP

Jacob H. Malta, New Britain, Pa., assignor to Malmark, Inc., Plumsteadville, Pa.

Filed Jun. 27, 1990, Ser. No. 546,369

Int. Cl.[5] G10K *1/07*

U.S. Cl. 84—406 **10 Claims**

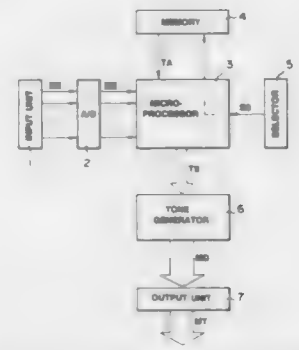
1. An anti-roll stand for a handbell, comprising:

a. a handbell having a circular hand guard; and

b. a stand having a base and a vertically-extending portion connecting said base with a top portion having resilient gripping means which firmly affix said stand to said handbell.

5,010,799

ELECTRONIC KEYBOARD INSTRUMENT WITH KEY DISPLACEMENT SENSORS



Kikuji Tanaka, and Kohtaro Hanzawa, both of Fussa, Japan, assignors to Casio Computer Co., Ltd., Tokyo, Japan

Continuation of Ser. No. 278,603, Dec. 1, 1988, abandoned. This application Mar. 19, 1990, Ser. No. 496,128

Claims priority, application Japan, Dec. 1, 1987, 62-305969

Int. Cl.[5] G10H *1/057, 1/46*

U.S. Cl. 84—627 **12 Claims**

9. An electronic keyboard instrument, comprising:

a keyboard having a plurality of keys;

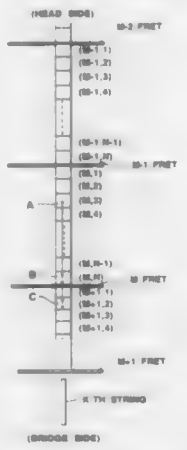
a plurality of key displacement sensor means each disposed in relation to a different one of said keys for detecting variable displacement of a key induced by a key operation, and for providing a corresponding displacement signal;

a plurality of selectively operative tone control means having tone control algorithms different from one another, for processing the displacement signal from said key displacement sensor means in manners different from one another to provide tone parameters; and

manually operative selector means for selecting one of said plurality of tone control means as being operative during play of the instrument, so that the selected tone control means commonly applies its tone control algorithm to displacement signals from said plurality of displacement sensor means.

5,010,800

ELECTRONIC MUSICAL INSTRUMENT CAPABLE OF SELECTING BETWEEN FRET AND FRETLESS MODES



Satoshi Yoshida, Hamura, Japan, assignor to Casio Computer Co., Ltd., Tokyo, Japan

Filed Sep. 14, 1989, Ser. No. 407,226

Claims priority, application Japan, Sep. 20, 1988, 63-123102[U]

Int. Cl.[5] G10D *3/06*; G10H *1/34*

U.S. Cl. 84—646 27 Claims

1. An electronic musical instrument comprising

a fingerboard having a fingering operation area over which a player performs a fingering operation;

mode setting means for selectively setting a fret mode for dividing said fingering operation area into a plurality of first pitch designation regions in half-tone pitch units, and a fretless mode for dividing each of said first pitch designation regions into a plurality of second pitch designation regions in pitch units smaller than said half-tone pitch units; and

pitch designating means for, when a fingering operation position is changed within a specific first pitch designation region of said plurality of first pitch designation regions in said fret mode set by said mode setting means, designating a same pitch as assigned to said specific first pitch designation region irrespective of a change in fingering operation position, and for, when said fingering operation position is changed to a specific second pitch designation region in said plurality of second pitch designation regions in said fretless mode set by said mode setting means, newly designating a pitch assigned to said specific second pitch designation region in response to a change in fingering operation position.

5,010,801

ELECTRONIC MUSICAL INSTRUMENT WITH A TONE PARAMETER CONTROL FUNCTION

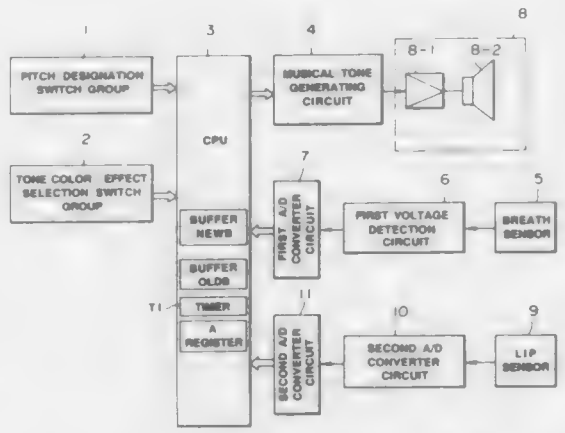
Shigeo Sakashita, Tokyo, Japan, assignor to Casio Computer Co., Ltd., Tokyo, Japan

Filed May 16, 1989, Ser. No. 352,559

Claims priority, application Japan, May 23, 1988, 63-67775[U]

Int. Cl.[5] G10H *1/053, 1/06, 1/18*

U.S. Cl. 84—735 20 Claims



6. An electronic musical instrument, comprising:

performance-input detection means for detecting a state of performance input by a player;

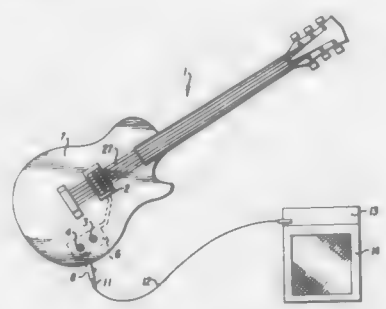
instruction means for giving an instruction to start generation of a musical tone in response to performance input force detected by said performance-input detection means when said performance-input force exceeds a predetermined value;

tendency detection means for judging if a variation in performance-input force during a predetermined time period detected by said performance-input detection means exhibits a tendency to increase or a tendency to decrease after a musical tone has been generated in accordance with the instruction from said instruction means;

output means for outputting first control data when said tendency detection means judges that the variation in the performance-input force during a predetermined time period exhibits a tendency to increase and meanwhile for outputting second control data when said tendency detection means judges that the variation in the performance-input force during a predetermined time period exhibits a tendency to decrease; and

control means for controlling parameters of said musical tone in accordance with the first control data, when said output means outputs the first control data while the musical tone is being generated in accordance with the instruction from said instruction means and for controlling at the same time so as to start generation of a sound of a particular effect, and for controlling parameters of the above musical tone in accordance with the second control data in a different manner from that in accordance with the first control data, when said output means outputs the second control data while the musical tone is being generated in accordance with the instruction from said instruction means and for controlling at the same time so as to stop generation of the sound of a particular effect.

5,010,802



ELECTRO-ACOUSTIC CONNECTOR FOR AMPLIFIED MUSICAL INSTRUMENTS

Terry M. Lanham, 4833 Meadow Lark La., Waldorf, Md. 20601

Filed Dec. 15, 1989, Ser. No. 450,962

Int. Cl.[5] G10H *3/18*

U.S. Cl. 84—743 6 Claims

1. An electro-acoustic connector for connecting a musical instrument to an electronic amplifier and adapted to receive both electrical signals from a transducer associated with said musical instrument and soundwaves produced by said musical instrument, said musical instrument having outlet means for transmitting said electrical signals and soundwaves, and electro-acoustic connector comprising a housing including a combined electrical and acoustic inlet means adapted for connection to said outlet means of said musical instrument for receiving said electrical signals and soundwaves from said outlet means of said musical instrument, said inlet means being adapted for transmitting soundwaves from said outlet means of said musical instrument into said housing, a microphone disposed in said housing for receiving said soundwaves transmitted from said outlet means of said musical instrument and generating electrical signals in response to said soundwaves, electrical outlet means in said housing for receiving electrical inlet means connected to an electronic amplifier, said electrical outlet means being adapted for transmitting electrical signals from said combined electrical and acoustic inlet means to said electrical outlet means, multiple contact switch means, and electrical conductor means connecting said combined electrical and acoustic inlet means, said microphone and said electrical outlet means to said switch means, said switch means being adapted to connect only said combined electrical and acoustic inlet means to said electrical outlet means or connect only said microphone to said electrical outlet means whereby electrical signals transmitted from said inlet means or from said microphone are transmitted to said electrical outlet means.

phone at the other end, for electrically connecting the microphone to the output jack and supporting it in a desired position within the instrument;

e. a sheathed cable coiled tightly around the rod and connectable at one end to the output jack and at the other end to the microphone; and

f. shrink wrap tubing surrounding and mechanically connecting adjacent portions of the coiled sheathed cable and output jack.

5,010,803

MICROPHONE MOUNT

Kenneth D. Donnell, 672 Norlene, Grass Valley, Calif. 95949

Filed Nov. 8, 1988, Ser. No. 268,934

Int. Cl.[5] G10H *3/00, 3/14, 3/18*

U.S. Cl. 84—743 5 Claims

1. An adjustable microphone assembly for mounting inside a musical instrument, comprising:

a. a miniature microphone;

b. an output jack comprising a threaded barrel having two ends, which barrel may receive a threaded nut from either end for permitting insertion of the jack from within the instrument into an opening in the wall of the instrument and allow communication between the inside and the outside of the instrument;

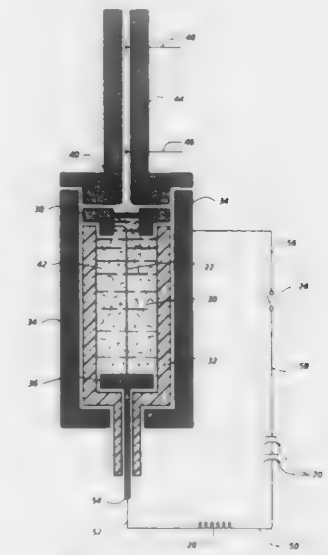
c. a threaded strap button nut for securing the output jack in the instrument by threading the nut onto the output jack from outside the instrument against a flat bearing surface and for receiving one end of an instrument supporting strap;

d. a bendable rod mechanically and electrically connectable to the output jack at one end of the rod and to the microphone at the other end, for electrically connecting the microphone to the output jack and supporting it in a desired position within the instrument;

e. a sheathed cable coiled tightly around the rod and connectable at one end to the output jack and at the other end to the microphone; and

f. shrink wrap tubing surrounding and mechanically connecting adjacent portions of the coiled sheathed cable and output jack.

5,010,804



LAUNCHING PROJECTILES WITH HYDROGEN GAS GENERATED FROM TITANIUM-WATER REACTIONS

Woodrow W. Lee, Potomac, Md., assignor to The United States of America as represented by the Secretary of the Navy, Washington, D.C.

Filed Aug. 6, 1990, Ser. No. 564,892

Int. Cl.[5] F41F *1/00*

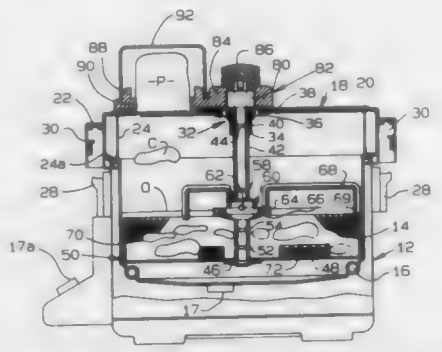
U.S. Cl. 89—7 21 Claims

1. A method of propelling a projectile from a device comprising:

(1) applying a high power pulse of electrical current to a metal conductor causing the metal conductor to explode and thus disperse the metal into a mixture of water and a titanium fuel selected from the group consisting of (a) titanium powder and (b) a mixture of titanium powder and boron powder wherein the molar ratio of boron to titanium is from more than 0:1 up to about 3:1, and wherein the pieces of dispersed metal from the exploded conductor provide hot spots which initiate a chemical reaction between the titanium fuel and water to generate hydrogen at high pressure in a chamber;

(2) continuing to supply the high powered pulse of electrical current to drive the reaction between the titanium fuel and water after the metal conductor has exploded and initiated the reaction;

(3) allowing the hydrogen gas pressure in the chamber to build to a preselected level; and then



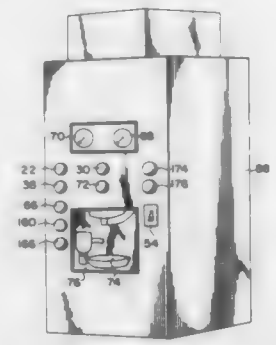
(4) using the hydrogen gas to push a projectile from the device.

5,010,805

POTATO CHIP MAKER INCLUDING APPARATUS FOR CENTRIFUGALLY REMOVING COOKING OIL FROM ANY PRODUCT

Daniel A. Ferrara, Looking Glass Rd., Bantam, Conn. 06750

Filed Sep. 13, 1989, Ser. No. 406,470
Int. Cl.[5] A41J *37/12*
U.S. Cl. 99—353 **9 Claims**



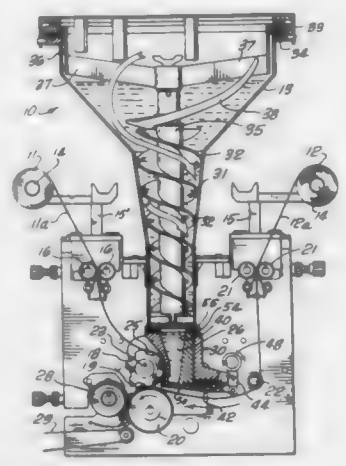
1. A potato chip maker comprising a cylindrical container, a cover for the container, a journal mounted vertically in the center of the cover, a shaft extending down through the journal, a perforate cylindrical basket mounted in its center on the bottom of the shaft, means for raising the shaft and holding the shaft in raised condition, a crank coupled to the upper end of the shaft by one-way clutch, the distal end of the crank mounting a potato holder offset from the shaft and having an open bottom, the cover being formed with an inlet opening offset from the shaft equal to the offset of the holder, a cutter disposed over the opening and parallel to the cover and spaced thereabove a distance equal to the thickness of a potato chip.

5,010,806

MACHINE TO FAST COOK PASTA AND SIMILAR FOODS

Henry R. Narcisi, 238 Larch Rd., Frankfort, Ill. 60423, and Ernest S. Kettelson, 16801 Ridge Rd., Minooka, Ill. 60447

Filed Aug. 9, 1990, Ser. No. 564,902
Int. Cl.[5] A47J *37/12*
U.S. Cl. 99—357 **22 Claims**



1. A fast cook machine to fast cook pasta and similar food products, comprising a cooking chamber to receive said pasta or similar food products for cooking therein, first stage cooking means to provide a first stage of cooking for said cooking chamber, second stage cooking means to provide a second stage of cooking for said cooking chamber, first stage connecting means to connect said first stage cooking means to said cooking chamber and second stage connecting means to connect said second stage cooking means to said same cooking chamber, food inlet means to permit entry of said pasta or similar food products into said cooking chamber for cooking and food outlet means to permit exit of said pasta or similar food products from said cooking chamber after completion of both said first and second stages of cooking within said same cooking chamber.

RAVIOLI MACHINE

Jim L. Anderson; Terry W. Beltz, both of Marysville, and Raymond E. Taylor, West Mansfield, all of Ohio, assignors to Nestec S.A., Vevey, Switzerland

Filed Jul. 17, 1990, Ser. No. 553,490
Int. Cl.[5] A21C *9/00*; **A23P** *1/00*
U.S. Cl. 99—450.6 **8 Claims**

1. In a machine for producing ravioli having a filling material hopper, a female die roll having a plurality of mold cavities for forming the ravioli, an anvil roll mounted adjacent the die roll to define a nip therebetween, means for feeding a first dough sheet over the die roll and into said nip, means for feeding a second dough sheet into said nip, and dispensing means for feeding a filling material from said hopper into a dough-lined mold cavity in the die roll whereby the dough sheets are sealed together around individual portions of filling material by passage through said nip, the improvement in which

said dispensing means comprises a slide bar dispenser in communication with the filling material hopper mounted in juxtaposition with said die roll, said dispenser having a longitudinal row of openings in the surface of the dispenser adjacent the nip between the die roll and the anvil roll, a plurality of slide bars in communication with said openings, said slide bars being mounted for reciprocating movement toward and away from the die roll on a substantially horizontal plane tangent to said nip, means for effecting reciprocatory movement of said slide bars, and means for coordinating the reciprocatory movement of the slide bars with the rotation of said die roll whereby filling material is discharged from the openings in the dispenser into the dough-lined mold cavities on said die roll immediately preceding said nip.

SPIRAL CONVEYOR OVEN

William E. Lanham, Conyers, Ga., assignor to APV Baker Inc., Atlanta, Ga.

Continuation-in-part of Ser. No. 468,756, Jan. 23, 1990, Pat. No.
Int. Cl.[5] A23L *3/02*; **F27B** *9/00, 9/16*; **B65G** *21/18*
U.S. Cl. 99—443 C **19 Claims**

1. A baking apparatus, comprising means forming an oven enclosure having opposed end portions and opposed sides; a conveyor for food products adapted to convey such products into and out of said enclosure at a controlled rate of speed along a path of travel, said enclosure having conveyor inlet and outlet openings formed in at least one of said end portions at predetermined elevations therein; said conveyor comprising an endless conveyor having an endless center drive chain, a first straight inlet section which passes through said conveyor inlet opening, a riser section following a generally spiral shaped path of travel through a plurality of levels of increasing elevation to a predetermined level adjacent one side of the enclosure, a second straight section extending from said predetermined level at said one side of the enclosure in a generally straight declining path of travel to a predetermined elevation and position between levels of the riser section of the conveyor on the opposite side of the enclosure, a declining section located between the levels of said riser section and extending from said predetermined position to a lower position in the enclosure while generally continuously decreasing in elevation, and a final straight section leading from said declining section to said conveyor outlet opening of the enclosure whereby the position of pans on the conveyor relative to the side of the conveyor are reversed during travel in the riser and declining sections of the conveyor; means for supplying heat to said enclosure for baking products in said oven; and means located outside of said enclosure for driving said center chain conveyor through its path of travel in the enclosure.

FODDER CONDITIONING AND PACKING PROCESS

Kenneth J. Williams, 2 W. McCabe Rd., El Centro, Calif. 92243

Filed Nov. 24, 1989, Ser. No. 440,796
Int. Cl.[5] B30B *13/00*
U.S. Cl. 100—35 **3 Claims**

1. A process for conditioning and compacting bales of fodder prior to storage and shipment which comprises the steps of:

equalizing the moisture level of said fodder including

measuring the moisture content of each of said bales;

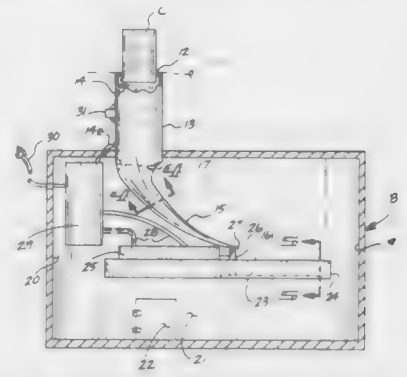
if said moisture content is below a first predetermined level, moisturizing said bale by a given amount of moisture;

if said moisture level is above a second predetermined level, drying said bale;

breaking said bales and spreading their contents into a generally density-wise homogeneous mat;

injecting additives into said mat;

conveying and breaking said mat into batches of generally equal weight; and



compacting each of said batches into separate bundles.

CAN DISPOSAL APPARATUS

Dale J. DeLorme, 4724 Evergreen St., Sheboygon, Wis. 53081

Filed Feb. 28, 1990, Ser. No. 486,293
Int. Cl.[5] B30B *15/30, 9/32*
U.S. Cl. 100—49 **1 Claim**

1. A can disposal apparatus operative in association with an elongate cylindrical can, wherein the can is defined by a predetermined height, and wherein the apparatus comprises,

an elongate, horizontally oriented counter top, and

a conduit underlying and intersecting the counter top through a conduit entrance opening defined by a predetermined diameter greater than a can diameter defined by the can, and

the conduit overlying a horizontal support tray, wherein the conduit includes an exit opening formed at its lower terminal end, and

a housing enclosure encompassing the support tray and the exit opening, and the housing including a forward wall and a side wall, and

the support tray spaced from the forward wall of the housing, and the housing including a storage compartment underlying the support tray, and

crushing means operative with the support tray to crush the can for subsequent deposit within the storage compartment, and

wherein a forward end of the support tray is spaced a further distance from the forward wall of the housing a spacing less than one-half the predetermined height of the can, and

wherein the exit opening of the conduit includes an arcuate chute integrally associated with the exit opening, and wherein the arcuate chute is directed downwardly and forwardly of the exit opening, and wherein the arcuate chute includes a lower edge spaced above the support tray, and wherein the crushing means includes a reciprocatable ram positioned underlying the forward edge of the arcuate chute in a retracted position, and wherein the ram is positioned forwardly of the forward edge of the arcuate chute adjacent the forward wall of the housing between the forward wall of the housing and the forward end of the support tray, and

wherein the crushing means further includes an elongate cylinder coaxially aligned with the support tray, and wherein a power source is positioned within the housing and is operative to extend and retract the ram to the forward wall of the housing, and

further including a switch lever positioned within the conduit normally biased in a horizontal orientation and positioned adjacent the entrance opening, wherein the switch lever is in electrical communication with a timer, wherein the timer actuates the power source for actuation of the ram upon directing of a can interiorly of the conduit through the entrance opening, and

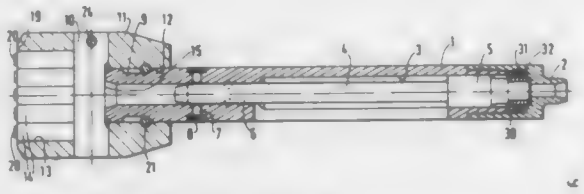
wherein the support tray is tapered to a narrowed forward end from a wider portion of the support tray adjacent to and underlying the forward edge of the arcuate chute to a

narrowed forward portion to the support tray coincident with the forward end of the support tray, and

wherein the housing includes an access door formed through the housing underlying the support tray to provide access to the storage compartment within the housing.

5,010,811

MARKING DEVICE ADAPTED FOR MOUNTING ON A FASTENER DRIVING APPARATUS



Roland Almeras, and Patrick Herelier, both of Tournon, France, assignors to Societe de Prospection et D'Inventions Techniques (S.P.I.T.), Cedex, France

Filed Jun. 30, 1989, Ser. No. 373,976

Claims priority, application France, Jul. 1, 1988, 88 08927

Int. Cl.[5] B31F *1/00*

U.S. Cl. 101—3.1 **25 Claims**

1. A marking device, comprising:

a barrel;

a piston movably disposed within said barrel between a first stored position and a second actuating position;

means for moving said piston between said first stored position and said second actuating position;

a case movably mounted upon one end of said barrel such that said one end of said barrel is disposed within said case and said case is movable with respect to said one end of said barrel between a marking position and a non-marking position;

at least one punch, having marking indicia thereon, mounted within said case; and

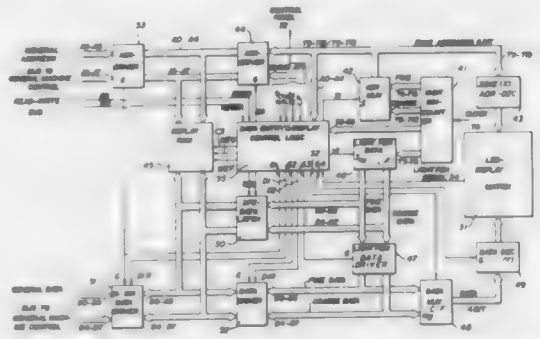
an anvil fixedly mounted upon said case for receiving an actuating force from said piston,

said anvil, said case, and said at least one punch all being substantially fixed with respect to each other and collectively defining a unit which is mounted upon said barrel for movement with respect to said barrel when said piston is moved from said first stored position to said second actuating position so as to act upon said anvil and move said case, said anvil, and said at least one punch from said non-marking position to said marking position.

5,010,812

ELECTRONIC DEVICE FOR CONTROLLING A PRINTING MACHINE

Anton Rodi; Udo Blasius, both of Leimen; Jürgen Reithofer, Nussloch, and Karl-Heinz May, Viernheim, all of Fed. Rep. of Germany, assignors to Heidelberger Druckmaschinen AG, Heidelberg, Fed. Rep. of Germany



Continuation of Ser. No. 47,017, May 5, 1987, abandoned, which is a continuation-in-part of Ser. No. 770,702, Aug. 29, 1985, abandoned, which is a continuation-in-part of Ser. No. 445,243, Nov. 29, 1982, abandoned. This application Aug. 22, 1989, Ser. No. 397,374

Claims priority, application Fed. Rep. of Germany, Nov. 28, 1981, 3147312

Int. Cl.[5] B41F *31/04, 13/12*

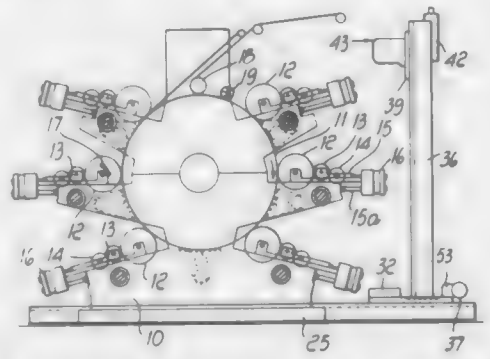
U.S. Cl. 101—148 **32 Claims**

1. A printing machine comprising: a data entry and display apparatus, a plurality of printing control elements included in the printing machine, each printing control element having actual and desired position values, a plurality of first optical elements arranged as a matrix which includes a plurality of rows and a plurality of columns, connected to said control elements, wherein each column represents a respective one of said printing control elements, and wherein each first optical element in said column represents a position value for a respective one of said printing control elements, a light pen having a contract point including a second optical element; said light pen being disposable so that said contact point is in optical

contact with one of said first optical elements, and timing means operatively engaging said first and second optical elements for timingly coordinating the position of said contact point in said optical contact with a respective one of said first optical elements for entering a respective position value for said printing control element.

5,010,813

MULTICOLOR FLEXOGRAPHIC MACHINE WITH A DEVICE FOR AUTOMATICALLY LOADING AND UNLOADING BLOCK-HOLDING ROLLERS



Flavio Buffo, Villafranca, Italy, assignor to Uteco S.p.A. Flexo & Converting Machinery, San Martino Buon Albergo, Italy

Filed May 29, 1990, Ser. No. 529,426

Claims priority, application Italy, Jun. 2, 1989, 84940 A/89

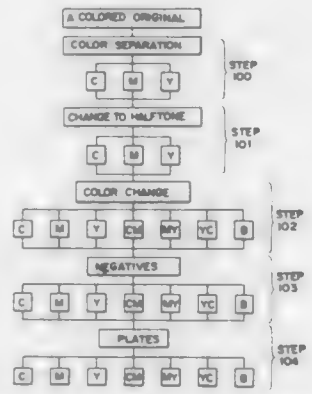
Int. Cl.[5] B41F *5/24, 13/00*

U.S. Cl. 101—178 **14 Claims**

1. A multicolor flexographic machine with star-shaped structure, having two supporting shoulders, a printing drum or offset roller mounted for rotation on said shoulders, a plurality of inking stations arranged angularly spaced around said drum, each station comprising a block-holding roller adjacent to the offset roller and a screen cylinder which is arranged to transfer ink from a drawing roller or from a doctor blade to the block-holding roller and can be moved close to, or away from, the offset roller, wherein it comprises a device or robot for automatic and sequential loading and unloading of the block-holding rollers on and from the various inking stations, said device having a support saddle or carriage which is motor-driven along guides which extend parallel to one of said shoulders, an upright structure which extends from said support carriage and is mounted for rotation about a vertical axis, a retractable arm which projects from said upright structure, grip or clamping means supported by said arm and adapted to engage an end or hold of a block-holding roller to raise it in a cantilevered manner, actuating means on said upright structure which are adapted to cause said arm to retract or extend, and program control means for controlling said loading and unloading device.

5,010,814

METHOD OF NON-OVERLAP HALFTONE-DOT PRINTING OF COLORED ORIGINAL ON CYLINDRICAL CONTAINER OUTER SURFACE



Toshibumi Shishikura, Shimizu, Japan, assignor to Daiwa Can Company, Tokyo, Japan

Filed Feb. 28, 1990, Ser. No. 486,104

Claims priority, application Japan, Mar. 13, 1989, 1-60240

Int. Cl.[5] B41F *17/22*

U.S. Cl. 101—211 **1 Claim**

1. A method of dry offset non-overlap half-tone dot printing of a colored original on the outer surface of a cylindrical container, comprising the steps of:

color separating a colored original of a print to be provided on the outer surface of the cylindrical container into three primary colors, cyan, magenta and yellow;

effecting a change-to-halftone to convert the color density of each of said three primary colors obtained by said color separation into proportional dot areas;

changing those portions of said dot areas of each of said primary colors that overlap with said dot areas of either one of the other said primary colors to give a resultant optical image of a secondary color in said colored original into corresponding dot areas of said secondary color, obtainable by blending two of said three primary colors with each other to produce cyan-magenta, magenta-yellow or yellow-cyan;

changing those portions of said dot areas of each of said primary colors that overlap with said dot areas of both of the other two said primary colors in said colored original into corresponding dot areas of a tertiary color, obtainable by blending said three primary colors together;

making an offset printing plate for each of said primary, secondary and tertiary colors, each said printing plate having raised portions representing printing elements in said plate being so arranged that an image produced by said plate for any one of said primary, secondary and tertiary colors does not overlap with images produced by said plates for the said other colors to give a compounded image reproducing the colored original;

kneading an ink of each of said primary, secondary and tertiary colors with a plurality of ink distributing rollers and supplying said ink to said raised portions of said plate for a respective said color;

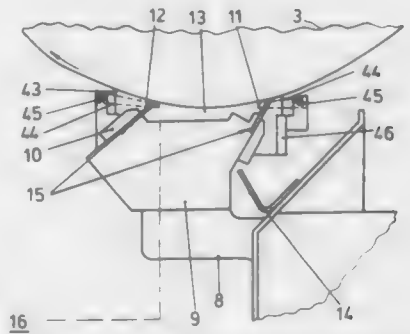
transferring each said kneaded ink on said raised portions of said plate one color after another onto a common offset printing blanket, and

further transferring said inks of all said colors on said blanket simultaneously onto the outer surface of the cylindrical container;

wherein said step of effecting a change-to-halftone comprises giving an effect of contact screening at the same angle for all said primary colors and forming pixels defined by screen pitch in contact screening so as to produce a compounded image on the outer surface of the cylindrical container consisting of at most three colors including one of said three primary colors, one of three secondary colors obtainable by blending any two of said three primary colors, and said tertiary color.

5,010,815

DOCTOR DEVICE



Norbert Weisbrod, Hessheim, and Norbert Köbler, Beindersheim, both of Fed. Rep. of Germany, assignors to Albert-Frankenthal AG, Frankenthal, Fed. Rep. of Germany

Filed Dec. 27, 1988, Ser. No. 290,152

Claims priority, application Fed. Rep. of Germany, Jan. 9, 1988, 3800411

Int. Cl.[5] B41F *7/02*

U.S. Cl. 101—217 **4 Claims**

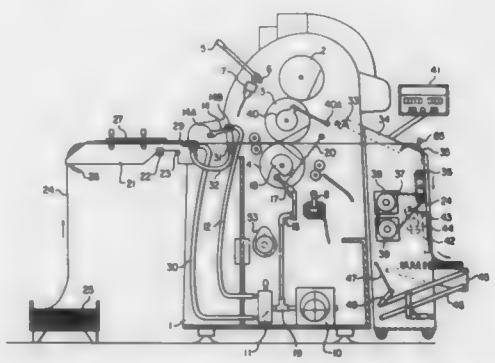
1. A doctor arrangement for wiping excess ink from a pitted cylinder forming a part of an off set press inking unit, comprising:

at least one doctor blade; and,

a blade mount having a slot extending along the length of said blade mount in which said blade is loosely fitted, said slot having a clearance width with an oversize with respect to the thickness of said doctor blade, the oversize amounting to 3/100 to 4/100 mm, said arrangement being entirely devoid of any other structure which tends to grip said doctor blade in said slot.

5,010,816

WEB TENSIONING DEVICE FOR PRINTING PRESS



Jean-Claude Sarda, 48 Avenue Claude Vellefaux, Paris, France 75010

Filed Nov. 10, 1988, Ser. No. 269,861

Claims priority, application France, Nov. 12, 1987, 87 15614

Int. Cl.[5] B41F *13/02;* **B65H** *20/12*

U.S. Cl. 101—228 **9 Claims**

7. In a printing press having a blanket cylinder and a press cylinder for printing on a continuous web that is drawn from an input region on an input side of the blanket cylinder and

press cylinder to an output region on an opposite side of the input region, the press having pressure releasing means for releasing pressure between the blanket cylinder and press cylinder after printing each format, an improved feed and drive mechanism for conveying the web from the input region to the output region, comprising in combination:

an electrically actuated drive means disposed at the output region for selectively pulling the web forward from the blanket cylinder and the press cylinder;

a tube extending below the web at the input region for sliding contact with the web and having a plurality of apertures;

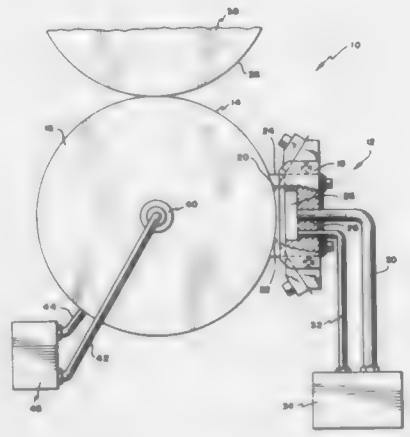
vacuum means for providing a vacuum to the tube;

means for mounting the tube rotatably to the press for allowing it to rotate in a forward direction a selected distance as the web is drawn forward by the press and blanket cylinders while in the printing position as a result of the adherence of the web to the tube because of the vacuum; and

spring means for urging the tube to rotate in a rearward direction when tension in the web is released as the press and blanket cylinders move to the released position, the vacuum applied to the web through the apertures causing the tube to draw the web in a rearward direction to remove any slack in the web following the printing of each format.

5,010,817

METHOD AND APPARATUS FOR FLEXOGRAPHIC PRINTING



Heinrich Konrad Grosshauser, Würzburg, Fed. Rep. of Germany, assignor to Koenig & Bauer Aktiengesellschaft, Würzburg, Fed. Rep. of Germany

Filed Apr. 18, 1989, Ser. No. 339,692

Claims priority, application Fed. Rep. of Germany, Apr. 26, 1988, 3814049

Int. Cl.[5] **B41F** *31/04, 31/06, 31/08;* **B41L** *27/10*

U.S. Cl. 101—350 **2 Claims**

1. A method for preventing plugging of screened surfaces of a printing plate which is inked-in by water-based printing inks in a web-fed rotary printing machine which prints a printed medium, said method comprising:

providing an inking unit;

providing a printing plate having screened surfaces;

supplying a water-based printing ink continuously to said inking unit;

contacting said printing ink in said inking unit with a screened ink roller;

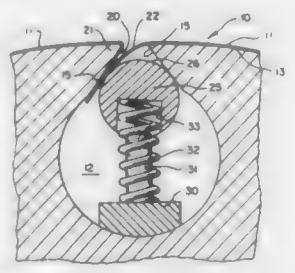
removing unused water-based printing ink continuously from said inking unit;

maintaining the temperature of said water-based ink in said inking unit within a first temperature range between 9 and 14 degrees Celsius;

supplying said water-based printing ink from said screened ink roller to said printing plate; and

maintaining a surface portion of said screened ink roller which supplies said water-based ink to said printing plate within a second, higher temperature range between 18 and 22 degrees Celsius.

5,010,818



TENSIONLESS PLATE LOCK-UP

Alan R. Wallschlaeger, Sr., Elmhurst, Ill., assignor to Rockwell International Corporation, Pittsburgh, Pa.

Continuation of Ser. No. 161,640, Feb. 29, 1988, abandoned. This application Nov. 17, 1989, Ser. No. 437,877

Int. Cl.[5] **B41F** *27/12*

U.S. Cl. 101—415.1 **2 Claims**

1. In combination:

a. a printing cylinder in a printing press having a longitudinal slot formed in an outer surface thereof to define at least one undercut surface against which both ends of a flexible printing plate are clamped to hold the plate securely against the outer surface of said cylinder;

b. locking means including a plurality of individual cylinders substantially evenly spaced along the length of said longitudinal slot;

c. individual spring biasing means disposed in operative compression between the bottom of said longitudinal slot and a spring receiving opening in each of said cylinders to urge individually each of said cylinders outwardly against the overlapping ends of the plate and hold them against said undercut surface; and

d. spacer means secured to the bottom of said longitudinal slot, said spacer means including a bar extending along the length of said slot, said bar including a plurality of evenly spaced protruding studs which receive said individual spring biasing means to hold said spring biasing means at fixed locations; said spring biasing means extending from the base of said studs to beyond the longitudinal extent of said studs and to the full depth of said spring receiving opening.

5,010,819

BLANKET CLEANING APPARATUS WITH SELECTIVELY ENGAGEABLE FLICKER BAR

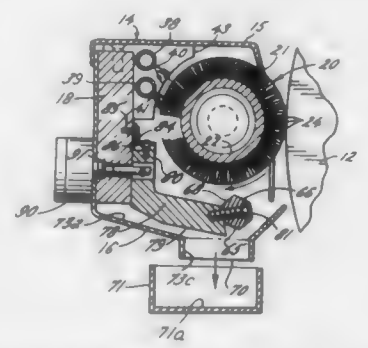
Diego Uribe, Barrington; Paul Driskill, Elgin, and Rolf Hantscho, Lake Zurich, all of Ill., assignors to Oxy-Dry Corporation, Itasca, Ill.

Filed Sep. 22, 1989, Ser. No. 411,104

Int. Cl.[5] **B41F** *35/00*

U.S. Cl. 101—425 **35 Claims**

1. An apparatus for cleaning a surface of a cylinder of a printing press having undesired foreign matter thereon comprising



scrub means including a rotatable brush roller having a longitudinal axis and radially extending bristles,

means for moving said rotatable brush roller into and out of engagement with the surface to be cleaned,

means for applying cleaning fluid to said cylinder surface to facilitate removal of foreign matter from said surface when said brush roller is in engagement with said surface,

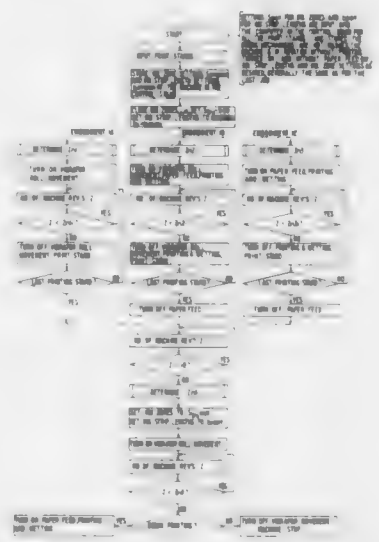
a flicker bar mounted for movement between an inoperative position removed from the bristles of said brush roller and an operative position engaging the brush roller such that the bristles thereof pass over the flicker bar and are flexed to effect removal of cleaning fluid and foreign matter carried by the bristles, and

means for moving said flicker bar between said operative

and inoperative positions, said flicker bar moving means being operable in timed relation to said brush roller moving means whereby said flicker bar is moveable into engaging relationship with said brush roller for removing cleaning fluid and foreign matter from the bristles of the brush roller while said brush roller is out of engagement with the surface to be cleaned.

5,010,820

PROCESS FOR THE DEFINED PRODUCTION OF AN INK DISTRIBUTION APPROPRIATE TO A PRODUCTION RUN IN THE INKING UNIT OF ROTARY PRINTING PRESSES



Gerhard Löffler, Walldorf, Fed. Rep. of Germany, assignor to Heidelberger Druckmaschinen AG, Heidelberg, Fed. Rep. of Germany

Continuation of Ser. No. 166,556, Mar. 10, 1988, abandoned. This application Feb. 20, 1990, Ser. No. 482,260

Claims priority, application Fed. Rep. of Germany, Mar. 11, 1987, 3707695

Int. Cl.[5] **B41F** *31/04, 31/20;* **B41M** *27/08*

U.S. Cl. 101—484 **19 Claims**

1. A controlled process for producing a previous ink zone profile corresponding to a previous printing job in at least one printing stand of a printing press and for changing from the previous ink zone profile corresponding to the previous printing job to a subsequent ink zone profile corresponding to a subsequent printing job, said subsequent printing job being carried out immediately subsequent to said previous printing job, said printing stand comprising a printing plate cylinder for positioning a printing plate, an ink reservoir for holding a supply of ink and an inking mechanism for transferring the ink between said ink reservoir and said printing plate during operation of said printing stand, said inking mechanism comprising a plurality of inking rollers, a plurality of individually adjustable ink zone metering devices, at least one ink fountain roller positioned adjacent said plurality of individually adjustable ink zone metering devices, and at least one ink transfer roller for transferring the ink between said ink fountain roller and at least one of said plurality of inking rollers, each of said plurality of individually adjustable ink zone metering devices defining a substantially corresponding ink zone of said at least one printing stand, said process comprising the steps of:

(a) producing the previous ink zone profile by initiating operation of:

said printing plate cylinder,

said plurality of inking rollers,

said at least one ink transfer roller, and

said at least one ink fountain roller, and

by transferring ink from said ink reservoir to said printing plate cylinder via forward a route of travel which extends:

from said ink reservoir through at least one of said plurality of individually adjustable ink zone metering devices,

thereafter to said at least one ink fountain roller,

thereafter to said at least one ink transfer roller,

thereafter to said plurality of inking rollers, and

thereafter to said printing plate cylinder;

(b) printing said previous printing job;

(c) terminating the printing of said previous printing job; and

(d) changing to subsequent ink zone profile corresponding to said immediately subsequent printing job by the process comprising the steps of:

(e) calculating at least one previous parameter characterizing said previous ink zone profile;

(f) calculating at least one subsequent parameter characterizing said subsequent ink zone profile;

wherein said subsequent printing job is carried out immediately subsequent to said previous printing job; and

(g) adjusting at least one of said plurality of adjustable ink zone metering devices, in accordance with said calculated previous and said subsequent parameters, and operating said inking mechanism to thereby change the ink zone profile in said printing stand from said previous ink zone profile to said subsequent ink zone profile, said operation of said inking mechanism comprising the transfer of ink from said inking mechanism and through at least one of said plurality of individually adjustable ink zone metering devices to said ink reservoir;

wherein said adjusting and operating step (g) comprises the steps of:

(g1) adjusting at least one of said plurality of individually adjustable ink zone metering devices to transfer ink from said inking mechanism to said ink reservoir;

(g2) initiating operation of:

said printing plate cylinder,

said plurality of inking rollers,

said at least one ink transfer roller, and

said at least one ink fountain roller;

to transfer ink from said printing plate cylinder to said ink reservoir via a reverse route of travel which extends:

from said printing plate cylinder to said same plurality of inking rollers as in step (a),

thereafter to said same at least one ink transfer roller as in step (a),

thereafter to said same at least one ink fountain roller as in step (a),

thereafter through at least one of said same plurality of individually adjustable ink zone metering devices as in step (a), and

thereafter to said same ink reservoir as in step (a);

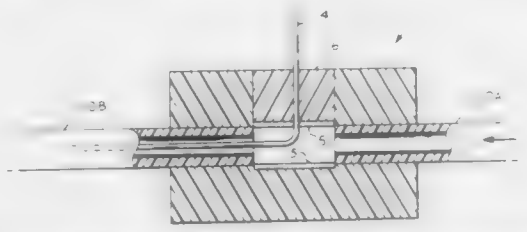
(g3) continuing operation of said printing plate cylinder, said plurality of inking rollers, said at least one ink transfer

roller and said at least one ink transfer roller until said plurality of inking rollers have a defined base ink layer deposited thereon;

(g4) adjusting at least one of said plurality of individually adjustable ink zone metering devices to transfer ink from said ink reservoir to said inking mechanism;

(g5) initiating operation of said at least one ink transfer roller to thereby transfer ink, on the surface of said at least one ink transfer roller, to said inking mechanism through at least one of said plurality of individually adjustable ink metering devices;

(g6) continuing operation of said at least one ink transfer roller until said subsequent ink zone profile is established; and



(h) printing said immediately subsequent printing job.

5,010,821

DUAL PURPOSE ENERGY TRANSFER CORD

Jim W. Blain, Scotts Valley, Calif., assignor to Lockheed Missiles & Space Company, Inc., Sunnyvale, Calif.

Filed Dec. 22, 1986, Ser. No. 945,047
Int. Cl.[5] C06C *5/04*
U.S. Cl. 102—275.8 **10 Claims**

1. A percussive reaction transferral/signal transmission means comprising

a tubular structure defining a hollow, elongated, gas channel,

means for creating and sustaining a percussion wave within said channel,

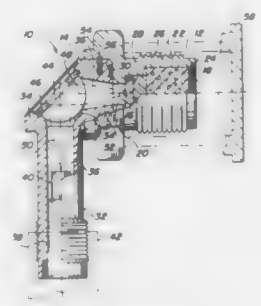
said percussion sustaining means comprising a reactive substance distributed as a thin layer on the inner surface of said tube,

and signal transmission means contained as the only other element within said channel,

said signal transmission means having an outer diameter substantially less than the inner diameter of said reactive substance.

5,010,822

EXPLOSIVE INITIATOR WITH ANGLED FIBER OPTIC INPUT



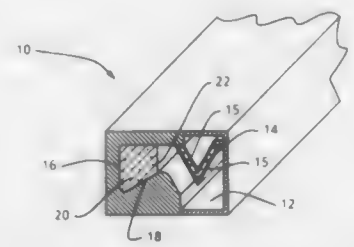
Mark Folsom, Hollister, Calif., assignor to Whittaker Ordnance, Inc., Hollister, Calif.

Filed Feb. 2, 1990, Ser. No. 473,785
Int. Cl.[5] F42C *13/02*
U.S. Cl. 102—201 **6 Claims**

1. An improved explosve initiator with an angled fiber optic input, said initiator comprising, in combination:

(a) a hollow elongated initiator cartridge having a longitudinal axis and a longitudinal passageway extending therethrough with an input end and an output end, an explosve positioned in said passageway, said explosive being explosively responsive to light of sufficient intensity and appropriate wavelength, a transparent window in said passageway sealing said explosive from said input end, and an output closure in said passageway downstream of said explosive; and,

(b) a hollow adapter connected to said cartridge input end, a part of said adapter extending at an angle from said longitudinal axis of said cartridge, said adapter having a longitudinal passageway extending therethrough with an output end adjacent to said cartridge input end and with an input end for holding the output end of an optical fiber having an output end and an input end, said adapter having a first portion containing said adapter input end and being at an angle to said cartridge longitudinal axis, and having a second portion containing said adapter output end and being in line with said cartridge longitudinal axis,



said first and second adapter portions intersecting, and a mirror lens disposed in said adapter passageway at the intersection of said first and second adapter portions for reflection of a light beam from said optical fiber into said cartridge passageway and for focusing said beam on said window to initiate said explosion.

5,010,823

LINEAR PROPELLING SEPARATOR

Peter A. Morrison, Laurel, Md., assignor to The United States of America as represented by the Secretary of the Navy, Washington, D.C.

Filed Jul. 13, 1990, Ser. No. 553,499
Int. Cl.[5] F42B *1/02*
U.S. Cl. 102—307 **7 Claims**

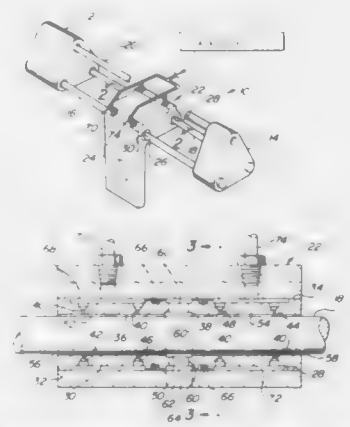
1. A device for use in severing a structure and spatially separating the severed parts, comprising:

an elongate housing adapted to be secured in adjacency to a structure to be severed;

said elongate housing having cavities extending generally coextensive throughout the length thereof;

an outwardly facing shaped explosive charge located in one of the housing cavities and adapted upon detonation to explosively sever a structure in its path; and,

a propelling charge located in another cavity of the housing which cavity has a throat opening defining a propulsion nozzle in communication with the one cavity and facing transversely to the direction of the outwardly facing shaped-charge;



whereby, upon detonation of the shaped-charge, the structure is severed, and, by-products of detonation of the shaped-charge ignite the propelling charge for spatially separating the severed parts.

5,010,824

LINEARLY MOVABLE TOOL OR WORK HANDLING UNIT

Raymond P. DeSantis, Troy, Mich., assignor to PTX-Pentronix, Inc., Lincoln Park, Mich.

Filed Dec. 4, 1989, Ser. No. 446,191
Int. Cl.[5] F16C *32/06*
U.S. Cl. 104—23.001 **12 Claims**

1. A linearly movable tool or work piece handling unit for operation in an abrasive particle atmosphere comprising:

cylindrical ways supported relative to each other at both ends;

a bushing surrounding each of said ways defining a pneumatic bearing gap between each of said ways and the bushing with an annular opening to atmosphere at both ends of said bushing and an air outlet intermediate the ends of said bushing in communication with said gap;

said bushings each having an array of circumferentially spaced radial input orifices adjacent each end of said bushing and an intermediate array adjacent each side of said air outlet for introducing pressurized air to said pneumatic bearing gap which defines a cylindrical pressure pad in said bearing gap between each end array and intermediate array of orifices;

a carriage receiving said bushings for movement of said carriage along said ways; and

passage means in said carriage for supplying said pressurized air to said orifices and for removing air from said air outlet.

5,010,825

RAIL CAR END ASSEMBLY

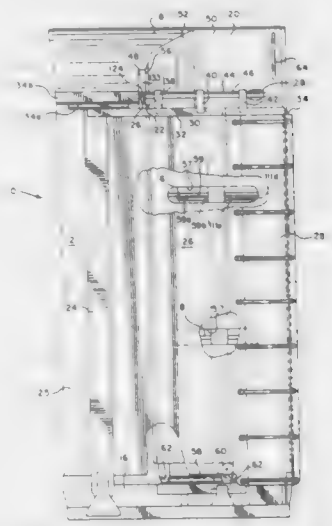
Harold E. Hesch, St. John, Ind., assignor to Trinity Industries, Inc., Dallas, Tex.

Continuation of Ser. No. 352,715, May 12, 1989, Pat. No. 4,9 4,234, which is a continuation of Ser. No. 65,948, Jun. 24, 1987, abandoned. This application Apr. 11, 1990, Ser. No. 508,365
Int. Cl.[5] B61D *17/06*
U.S. Cl. 105—378 **9 Claims**

1. A railway car having a pair of longitudinal ends and comprising:

a generally horizontal floor structure;

first and second laterally spaced generally longitudinally extending side walls connected with the floor structure and extending generally upwardly therefrom;



said side walls extending substantially continuously between the ends of the car and defining an end opening therebetween at one of the ends of the railway car;

a generally vertical support post supported on said floor structure adjacent one of said side walls;

said support post being positioned laterally inwardly from said side wall and longitudinally inward from the end of the car, said support post and said side wall defining a space therebetween;

first guiding means supported on the floor structure and extending within said space;
